SERIES OF BULLETINS PUBLISHED BY THE BUREAU OF LABOR STATISTICS.

The publication of the annual and special reports and of the bi-monthly bulletin was discontinued in July, 1912, and since that time a bulletin has been published at irregular intervals. Each number contains matter devoted to one of a series of general subjects. These bulletins are numbered consecutively beginning with No. 101, and up to No. 236 they also carry consecutive numbers under each series. Beginning with No. 237 the serial numbering has been discontinued. A list of the series is given below. Under each is grouped all the bulletins which contain material relating to the subject matter of that series. A list of the reports and bulletins of the bureau issued prior to July 1, 1912, will be furnished on application.

Wholesale Prices.

- Bul. 114. Wholesale prices, 1890 to 1912.
- Bul. 149. Wholesale prices, 1890 to 1913.
- Bul. 173. Index numbers of wholesale prices in the United States and foreign countries.
- Bul. 181. Wholesale prices, 1890 to 1914.
- Bul. 200. Wholesale prices, 1890 to 1915.
- Bul. 226. Wholesale prices, 1890 to 1916.

Retail Prices and Cost of Living.

- Bul. 105. Retail prices, 1890 to 1911: Part I.
Retail prices, 1890 to 1911: Part II—General tables.
- Bul. 106. Retail prices, 1890 to June, 1912: Part I.
Retail prices, 1890 to June, 1912: Part II—General tables.
- Bul. 108. Retail prices, 1890 to August, 1912.
- Bul. 110. Retail prices, 1890 to October, 1912.
- Bul. 113. Retail prices, 1890 to December, 1912.
- Bul. 115. Retail prices, 1890 to February, 1913.
- Bul. 121. Sugar prices, from refiner to consumer.
- Bul. 125. Retail prices, 1890 to April, 1913.
- Bul. 130. Wheat and flour prices, from farmer to consumer.
- Bul. 132. Retail prices, 1890 to June, 1913.
- Bul. 136. Retail prices, 1890 to August, 1913.
- Bul. 138. Retail prices, 1890 to October, 1913.
- Bul. 140. Retail prices, 1890 to December, 1913.
- Bul. 156. Retail prices, 1907 to December, 1914.
- Bul. 164. Butter prices, from producer to consumer.
- Bul. 170. Foreign food prices as affected by the War.
- Bul. 184. Retail prices, 1907 to June, 1915.
- Bul. 197. Retail prices, 1907 to December, 1915.
- Bul. 228. Retail prices, 1907 to December, 1916.

Wages and Hours of Labor.

- Bul. 116. Hours, earnings, and duration of employment of wage-earning women in selected industries in the District of Columbia.
- Bul. 118. Ten-hour maximum working-day for women and young persons.
- Bul. 119. Working hours of women in the pea canneries of Wisconsin.
- Bul. 128. Wages and hours of labor in the cotton, woolen, and silk industries, 1890 to 1912.
- Bul. 129. Wages and hours of labor in the lumber, millwork, and furniture industries, 1890 to 1912.
- Bul. 131. Union scale of wages and hours of labor, 1907 to 1912.
- Bul. 134. Wages and hours of labor in the boot and shoe and hosiery and knit goods industries, 1890 to 1912.
- Bul. 135. Wages and hours of labor in the cigar and clothing industries, 1911 and 1912.
- Bul. 137. Wages and hours of labor in the building and repairing of steam railroad cars, 1890 to 1912.
- Bul. 143. Union scale of wages and hours of labor, May 15, 1913.
- Bul. 146. Wages and regularity of employment in the dress and waist industry of New York City.
- Bul. 147. Wages and regularity of employment in the cloak, suit, and skirt industry.
- Bul. 150. Wages and hours of labor in the cotton, woolen, and silk industries, 1907 to 1913.

Wages and Hours of Labor—Concluded.

- Bul. 151. Wages and hours of labor in the iron and steel industry in the United States, 1907 to 1912.
- Bul. 153. Wages and hours of labor in the lumber, millwork, and furniture industries, 1907 to 1913.
- Bul. 154. Wages and hours of labor in the boot and shoe and hosiery and underwear industries, 1907 to 1913.
- Bul. 160. Hours, earnings, and conditions of labor of women in Indiana mercantile establishments and garment factories.
- Bul. 161. Wages and hours of labor in the clothing and cigar industries, 1911 to 1913.
- Bul. 163. Wages and hours of labor in the building and repairing of steam railroad cars, 1907 to 1913.
- Bul. 168. Wages and hours of labor in the iron and steel industry in the United States, 1907 to 1913.
- Bul. 171. Union scale of wages and hours of labor, May 1, 1914.
- Bul. 177. Wages and hours of labor in the hosiery and underwear industry, 1907 to 1914.
- Bul. 178. Wages and hours of labor in the boot and shoe industry, 1907 to 1914.
- Bul. 187. Wages and hours of labor in the men's clothing industry, 1911 to 1914.
- Bul. 190. Wages and hours of labor in the cotton, woolen, and silk industries, 1907 to 1914.
- Bul. 194. Union scale of wages and hours of labor, May 1, 1915.
- Bul. 204. Street railway employment in the United States.
- Bul. 214. Union scale of wages and hours of labor, May 15, 1916.
- Bul. 218. Wages and hours of labor in the iron and steel industry, 1907 to 1915.
- Bul. 225. Wages and hours of labor in the lumber, millwork, and furniture industries, 1915.
- Bul. 232. Wages and hours of labor in the boot and shoe industry, 1907 to 1916.
- Bul. 238. Wages and hours of labor in woolen and worsted goods manufacturing, 1916. [In press.]
- Bul. 239. Wages and hours of labor in cotton goods manufacturing and finishing, 1916.
- Bul. 245. Union scale of wages and hours of labor, May 15, 1917. [In press.]

Employment and Unemployment.

- Bul. 109. Statistics of unemployment and the work of employment offices in the United States.
- Bul. 172. Unemployment in New York City, N. Y.
- Bul. 182. Unemployment among women in department and other retail stores of Boston, Mass.
- Bul. 183. Regularity of employment in the women's ready-to-wear garment industries.
- Bul. 192. Proceedings of the American Association of Public Employment Offices.
- Bul. 195. Unemployment in the United States.
- Bul. 196. Proceedings of the Employment Managers' Conference held at Minneapolis, January, 1916.
- Bul. 202. Proceedings of the conference of the Employment Managers' Association of Boston, Mass., held May 10, 1916.
- Bul. 206. The British system of labor exchanges.
- Bul. 220. Proceedings of the Fourth Annual Meeting of the American Association of Public Employment Offices, Buffalo, N. Y., July 20 and 21, 1916.
- Bul. 223. Employment of women and juveniles in Great Britain during the War.
- Bul. 227. Proceedings of the Employment Managers' Conference, Philadelphia, Pa., April 2 and 3, 1917.
- Bul. 235. Employment system of the Lake Carriers' Association.
- Bul. 241. Public employment offices in the United States. [In press.]

Women in Industry.

- Bul. 116. Hours, earnings, and duration of employment of wage-earning women in selected industries in the District of Columbia.
- Bul. 117. Prohibition of nightwork of young persons.
- Bul. 118. Ten-hour maximum working-day for women and young persons.
- Bul. 119. Working hours of women in the pea canneries of Wisconsin.
- Bul. 122. Employment of women in power laundries in Milwaukee.
- Bul. 160. Hours, earnings, and conditions of labor of women in Indiana mercantile establishments and garment factories.
- Bul. 167. Minimum-wage legislation in the United States and foreign countries.

Women in Industry—Concluded.

- Bul. 175. Summary of the report on condition of woman and child wage earners in the United States.
- Bul. 176. Effect of minimum-wage determinations in Oregon.
- Bul. 180. The boot and shoe industry in Massachusetts as a vocation for women.
- Bul. 182. Unemployment among women in department and other retail stores of Boston, Mass.
- Bul. 193. Dressmaking as a trade for women in Massachusetts.
- Bul. 215. Industrial experience of trade-school girls in Massachusetts.
- Bul. 223. Employment of women and juveniles in Great Britain during the War.

Workmen's Insurance and Compensation (including laws relating thereto).

- Bul. 101. Care of tuberculous wage earners in Germany.
- Bul. 102. British National Insurance Act, 1911.
- Bul. 103. Sickness and accident insurance law of Switzerland.
- Bul. 107. Law relating to insurance of salaried employees in Germany.
- Bul. 126. Workmen's compensation laws of the United States and foreign countries.
- Bul. 155. Compensation for accidents to employees of the United States.
- Bul. 185. Compensation legislation of 1914 and 1915.
- Bul. 203. Workmen's compensation laws of the United States and foreign countries.
- Bul. 210. Proceedings of the Third Annual Meeting of the International Association of Industrial Accident Boards and Commissions.
- Bul. 212. Proceedings of the conference on social insurance called by the International Association of Industrial Accident Boards and Commissions.
- Bul. 217. Effect of workmen's compensation laws in diminishing the necessity of industrial employment of women and children.
- Bul. 240. Comparison of workmen's compensation laws of the United States.
- Bul. 243. Workmen's compensation legislation in the United States and foreign countries. [In press.]

Industrial Accidents and Hygiene.

- Bul. 104. Lead poisoning in potteries, tile works, and porcelain enameled sanitary ware factories.
- Bul. 120. Hygiene of the painters' trade.
- Bul. 127. Dangers to workers from dusts and fumes, and methods of protection.
- Bul. 141. Lead poisoning in the smelting and refining of lead.
- Bul. 157. Industrial accident statistics.
- Bul. 165. Lead poisoning in the manufacture of storage batteries.
- Bul. 179. Industrial poisons used in the rubber industry.
- Bul. 188. Report of British departmental committee on danger in the use of lead in the painting of buildings.
- Bul. 201. Report of committee on statistics and compensation insurance cost of the International Association of Industrial Accident Boards and Commissions. [Limited edition.]
- Bul. 205. Anthrax as an occupational disease.
- Bul. 207. Causes of death by occupation.
- Bul. 209. Hygiene of the printing trades.
- Bul. 216. Accidents and accident prevention in machine building.
- Bul. 219. Industrial poisons used or produced in the manufacture of explosives.
- Bul. 221. Hours, fatigue, and health in British munition factories.
- Bul. 230. Industrial efficiency and fatigue in British munition factories.
- Bul. 231. Mortality from respiratory diseases in dusty trades. [In press.]
- Bul. 234. Safety movement in the iron and steel industry, 1907 to 1917.
- Bul. 236. Effect of the air hammer on the hands of stonecutters. [In press.]

Conciliation and Arbitration (including strikes and lockouts).

- Bul. 124. Conciliation and arbitration in the building trades of Greater New York.
- Bul. 133. Report of the industrial council of the British Board of Trade on its inquiry into industrial agreements.
- Bul. 139. Michigan copper district strike.
- Bul. 144. Industrial court of the cloak, suit, and skirt industry of New York City.
- Bul. 145. Conciliation, arbitration, and sanitation in the dress and waist industry of New York City.
- Bul. 191. Collective bargaining in the anthracite coal industry.
- Bul. 198. Collective agreements in the men's clothing industry.
- Bul. 233. Operation of the Industrial Disputes Investigation Act of Canada. [In press.]

Labor Laws of the United States (including decisions of courts relating to labor).

- Bul. 111. Labor legislation of 1912.
- Bul. 112. Decisions of courts and opinions affecting labor, 1912.
- Bul. 148. Labor laws of the United States, with decisions of courts relating thereto.
- Bul. 152. Decisions of courts and opinions affecting labor, 1913.
- Bul. 166. Labor legislation of 1914.
- Bul. 169. Decisions of courts affecting labor, 1914.
- Bul. 186. Labor legislation of 1915.
- Bul. 189. Decisions of courts affecting labor, 1915.
- Bul. 211. Labor laws and their administration in the Pacific States.
- Bul. 213. Labor legislation of 1916.
- Bul. 224. Decisions of courts affecting labor, 1916.
- Bul. 229. Wage-payment legislation in the United States.
- Bul. 244. Labor legislation of 1917. [In press.]
- Bul. 246. Decisions of courts affecting labor, 1917.

Foreign Labor Laws.

- Bul. 142. Administration of labor laws and factory inspection in certain European countries.

Vocational Education.

- Bul. 145. Conciliation, arbitration, and sanitation in the dress and waist industry of New York City.
- Bul. 147. Wages and regularity of employment in the cloak, suit, and skirt industry.
- Bul. 159. Short-unit courses for wage earners, and a factory school experiment.
- Bul. 162. Vocational education survey of Richmond, Va.
- Bul. 199. Vocational education survey of Minneapolis.

Labor as Affected by the War.

- Bul. 170. Foreign food prices as affected by the War.
- Bul. 219. Industrial poisons used or produced in the manufacture of explosives.
- Bul. 221. Hours, fatigue, and health in British munition factories.
- Bul. 222. Welfare work in British munition factories.
- Bul. 223. Employment of women and juveniles in Great Britain during the War.
- Bul. 230. Industrial efficiency and fatigue in British munition factories.
- Bul. 237. Industrial unrest in Great Britain.

Miscellaneous Series.

- Bul. 117. Prohibition of nightwork of young persons.
- Bul. 118. Ten-hour maximum working day for women and young persons.
- Bul. 123. Employers' welfare work.
- Bul. 158. Government aid to home owning and housing of working people in foreign countries.
- Bul. 159. Short-unit courses for wage earners, and a factory school experiment.
- Bul. 167. Minimum-wage legislation in the United States and foreign countries.
- Bul. 170. Foreign food prices as affected by the War.
- Bul. 174. Subject index of the publications of the United States Bureau of Labor Statistics up to May 1, 1915.
- Bul. 208. Profit sharing in the United States.
- Bul. 222. Welfare work in British munition factories.
- Bul. 242. Food situation in Central Europe, 1917.

MONTHLY REVIEW

OF THE

U. S. BUREAU OF LABOR STATISTICS

VOL. VI—NO. 1

WASHINGTON

JANUARY, 1918

COST OF LIVING IN THE DISTRICT OF COLUMBIA.

FOURTH ARTICLE—WAGE-EARNING WOMEN: WHO THEY ARE AND WHAT THEY DO.

As a part of the cost of living study in the District of Columbia for the year 1916 a special study was made of wage-earning women. This special study was made for the purpose of finding out how working women live, with special reference to the manner in which they apportion the expenditure of their incomes as between food, clothing, room rent, and the other items of expense. The study was confined to women receiving incomes less than \$1,100 a year. The study must not be regarded as a study in philanthropy, poverty, and crime, because of this exclusion of the higher incomes. The fact is, very few working women receive more than \$1,000 a year. The vast majority receive much less than \$1,000 a year and these are the socially significant women wage earners. It is of immense importance to know how these women live, whether they live at home or away from home, whether their meager earnings are supplemented out of the general family funds or whether their earnings must support the wage earner and help out the insufficient income of the family, and whether they obtain sufficient nourishment, clothing, and the other essentials to enable them to live healthy and comfortable lives. Of course in some instances women receiving higher incomes have such demands to meet as force them down to or below the "poverty line." Also it may be argued that the extravagance of the better paid women workers is as significant, economically and socially, as the rigorous economy of the poorly paid women. For the purpose of this study this argument is of no importance.

In the selection of women workers to furnish the information required in this study the effort was made to obtain a fair representation from the various industrial employments open to women in the city of Washington. No occupations, except those of trained nurse, domestic servant, and washerwoman, were excluded.

Except in a few very unusual cases, such as protracted illness, no woman was included who had not worked during at least nine calendar months of the year 1916, unless the occupation was seasonal in character and so failed to furnish nine months' employment during the year. Thus the merely occasional or intermittent workers were excluded, and the study limited to women who were regularly engaged in wage-earning employments.

This study is based upon schedules for the year 1916, secured through personal visits and interviews by agents of the bureau. These interviews were obtained either at the girl's home or her place of employment, in the latter case through the cooperation of her employer, who allowed her to be questioned during working hours. In almost all instances the women visited were willing to give the desired information. In the final tabulation of results only those schedules were used in which the information obtained was believed to be complete and accurate.

The total number of schedules thus obtained was 676, of which 600 were from white women and 76 from colored women. The present article is concerned solely with the former group, inasmuch as the industrial employment and living conditions of the two races were found to be too dissimilar to permit of combined treatment. Also, it is to be noted that this article is limited to a general consideration of the personal and working conditions of the 600 white wage-earning women. An analysis of their living conditions—housing, food, clothing, etc.—will appear in a succeeding article.

INDUSTRIES AND OCCUPATIONS REPRESENTED.

The employments engaged in by the 600 women were as follows: United States Government employees, 63; office clerks, stenographers, and cashiers in private employment, 172; saleswomen, 192; telephone operators, 38; factory workers, 95; waitresses in hotels and restaurants, 12; and laundry workers, 28.

The employments here represented may be taken as fairly typical of woman's work in the District of Columbia, although the numbers shown are not necessarily proportionate to the total numbers engaged in the several industries. This is particularly true of the employees of the Federal Government, as no effort was made to cover at all fully the better paid Government employees. Of the 63 for whom schedules were obtained the majority were operatives and printers' assistants at the Bureau of Engraving and Printing. The others were clerks and stenographers in various departments, employees of the Congressional Library and Capitol, and one charwoman. Two school-teachers and one librarian employed by the District of Columbia are also here included as Government employees.

As regards the factory work covered, a word of reminder is necessary. Washington is unique among the large cities of the country in having very few manufacturing industries. Those existing are mostly small, and, altogether, employ comparatively few persons. The women here classed as factory workers represent a number of miscellaneous trades—box making, cigar manufacture, candy making, tailoring, printing, and publishing. A number of seamstresses and milliners are also included in this group.

Operatives and printers' assistants at the United States Bureau of Engraving and Printing are engaged in work of a mechanical or manufacturing nature, but in this study they have been grouped under United States Government employees, inasmuch as their other conditions of employment—such as permanent tenure of position—are quite different from those of privately controlled industry.

RACE, MARITAL CONDITION, AGE, AND EXPERIENCE.

As practically all of the women covered were either native Americans or of English-speaking families of long residence, no racial separation seemed necessary. The race factor, indeed, except that of white and colored, seems to be of very little significance among the wage-earning women of the District, either as regards wage-earning capacity or as regards living conditions.

As regards marital condition, 542 of the 600 women were single, while 58 had been married and were either widowed, divorced, or separated at the time of the investigation. It is interesting to note that 15 of the 58 married women had children dependent on them for support.

In the matter of age there was a wide distribution. None was under 16 years of age, and only 26, or 4 per cent, were between 16 and 18 years, whereas 142, or 24 per cent, were between 18 and 21, and 432, or 72 per cent, were 21 years of age or over. There were 144, or 24 per cent, 30 years old and above. One very interesting case was that of a woman of 75, so crippled with rheumatism that she could not get out without great difficulty, trying to save herself from dependence by doing dressmaking.

Also, these women were not beginners in industry. Not less than 62 per cent had been wage earners for at least five years, and as many as 5 per cent had been wage earners for 20 years or more.

ANNUAL INCOME.

The lowest income received by any of these workers was \$130.50 per year. This was received by a sales girl, age 17, her maximum wage being \$4 per week, and 10 weeks being lost through inability to find work. There were only two other girls who had received

less than \$150 per year. But 274, or 46 per cent of the total, received under \$400 per year—approximately \$8 per week—and 381, or 64 per cent, received under \$500 per year—approximately \$10 per week. Only 35 women, or 6 per cent, received as much as \$800 a year—approximately \$16 per week.

The following table shows the distribution of the 600 women by annual income and age groups. The annual income here referred to is the total amount of money income received during the year. Gifts of new articles were credited as money income, but no other gifts except actual money were so included. In all cases the earnings from labor constituted the major part of total income, but in a limited number of cases money gifts from parents and relatives, and returns from savings and investments were of considerable importance.

AGE AND ANNUAL INCOME.

Annual income.	Total.	Under 18	18 and under 21	21 and under 25	25 and under 30	30 and under 40	40 and over.
Under \$300.....	133	21	53	25	9	8	17
\$300 and under \$400.....	141	3	53	51	14	13	7
\$400 and under \$500.....	107	1	14	33	29	14	16
\$500 and under \$600.....	88	1	9	32	28	15	3
\$600 and under \$700.....	53		7	15	13	13	5
\$700 and under \$800.....	43		3	5	18	11	6
\$800 and under \$1,100.....	35		3	6	10	14	2
Total.....	600	26	142	167	121	88	56

AT HOME AND AWAY FROM HOME.

Of the 600 women, 414, or 69 per cent, lived at home with their immediate families, all but 51 of these living with parents. The remaining 186, or 31 per cent, lived away from home, either in private families, in boarding houses, in working-girls' homes, or were house-keeping in lodgings on their own account. Their distribution on this point is shown in the following table, by income groups:

LIVING CONDITIONS AND ANNUAL INCOME.

Annual income.	Total.	At home.	Away from home.				
			Total.	Private families.	House-keeping.	Boarding houses.	Homes for working girls.
Under \$300.....	133	100	33	15	13		5
\$300 and under \$400.....	141	105	36	19	8	5	4
\$400 and under \$500.....	107	74	33	14	12	6	1
\$500 and under \$600.....	88	54	34	17	7	7	3
\$600 and under \$700.....	53	37	16	3	7	3	3
\$700 and under \$800.....	43	24	19	10	8	1	
\$800 and under \$1,100.....	35	20	15	6	3	3	3
Total.....	600	414	186	84	58	25	19

It is to be emphasized that living at home does not necessarily mean that a woman is assisted by her family. Usually, such a woman is in a more favorable economic position than women away from home, inasmuch as she has assistance at hand in case of sickness or unemployment. But this is not always the case, as many of the women listed above as living at home were not only supporting themselves, but were also supporting their families in whole or in part. Moreover, many girls stayed at home when they might have secured better positions and more independence by going to some other place, because they felt their services or companionship in the home was needed by their parents even when no financial assistance was given to the family.

DEGREE OF SELF-SUPPORT.

The degree in which women workers may be receiving assistance from their families or other sources is a very important factor in the industrial world, for to the extent that such workers are having their regular wage supplemented by outside assistance, they are able to offer their services in the labor market at lower rates than are workers entirely dependent on their own resources. The most frequent example of this sort of subsidized labor is that of girls living at home and receiving board and lodging free or at nominal rates.

Of the 600 women included in this study, 272, or 45 per cent, were found to be in receipt of outside assistance. The remaining 328, or 55 per cent, were entirely self-supporting, and in addition, 129 of these 328 had other persons wholly or partially dependent upon them for support.

In this grouping into "assisted" and "self-supporting," the effort was made to group as self-supporting only those women who received no contribution to their living expenses from their families or others. Thus a number of cases were placed in the "assisted" group, in which the assistance received was comparatively slight. On the other hand, in a number of cases a girl was classed as self-supporting when she probably could not have obtained the same living conditions at the same price commercially, and so the two groups would balance each other to a large extent.

At best, the question of assistance is one that often can not be readily determined. Usually it is in the form of board or lodging without pay or at reduced rates. But sometimes, particularly with women living at home, assistance is given in forms impossible to trace. The facts here presented were obtained by very careful inquiry, and the classifications are as accurate as it is possible to make them.

As would be expected, assistance occurred chiefly among the women workers with the small annual incomes. Thus of the 274 women with incomes of less than \$400 per year (approximately \$8 per week), 203, or 74 per cent, were assisted. On the other hand, 6 women, or 17 per cent, of those receiving \$800 or more per year were assisted. These, in part, belonged to what might be called the "pin money" group—young women of well-to-do families. On the whole, however, this investigation found very few women of this class. Certainly 99 per cent of all those included were working because working was necessary.

The following table gives detailed data by income groups showing the number of women living at home or away from home and whether they were assisted or self-supporting, and with or without dependents:

ANNUAL INCOME AND LIVING CONDITIONS.

Annual income.	Total.	At home.			Away from home.		
		Assisted.	Self-supporting.	Self-supporting with dependents.	Assisted.	Self-supporting.	Self-supporting with dependents.
Under \$300.....	133	91	5	4	16	15	2

WAGES AND YEARS OF SERVICE.

The present study was not a wage investigation.¹ It was concerned primarily with the cost and manner of living of working women, and here the determining factor is the total amount of annual income, not the daily or weekly wage rate.

Nevertheless the wage rates at which this group of 600 women were working are very significant, and particularly so when studied in relation to the number of years at work. That an inexperienced girl or woman should start work at a low wage is not especially important, although the wage of apprentice girls should bear some relation to the cost of living. There is a widespread notion, however, that a woman who lives at home ought to be willing and grateful to work for wages insufficient to support a woman living independently

¹ An investigation of hours, earnings, and duration of employment of wage-earning women in the District of Columbia was made in 1913 by the Bureau of Labor Statistics. The results were published in Bulletin 116.

of all family assistance. Aided and abetted by this hoary economic fallacy many parasitic industries and trades have been able to live and even to achieve much prosperity on the subsidies contributed by working women. It ought not to be necessary to point out that no woman who is mentally competent and who has worked at an occupation long enough to acquire proficiency ought to be required or requested to work for a wage insufficient to enable her to live in reasonable comfort. Industries or occupations, if such there be, which can not live except on the subsidies from family incomes contributed by exploited women and child workers, ought to die—the sooner the better for the nation and the world at large.

It is therefore extremely significant to note that the majority of the women covered by this study were not only working at distressingly low wages, but that a very large proportion of them were women who had been wage earners for many years. Thus of a total of 600, 316, or 53 per cent, were receiving less than \$9 per week at the end of the year 1916, and of these 316, 145, or 46 per cent, had been engaged at some gainful work for five years or more. Still more striking is the fact that of 80 women who had been at work for 15 years barely one-third were receiving as much as \$12 per week. The detailed data on this point are shown in the following table, which gives the wage rates of women employees classified according to the number of years they had been working for wages. For convenience of comparison all wages and salaries are shown on a weekly basis. In this table the data are for all occupations combined. Data for separate employments are given in Table 2 at the end of this article.

WEEKLY WAGES AND NUMBER OF YEARS WORKING FOR WAGES.

SCHOOLING AND ITS RELATION TO WAGES.

The majority of the 600 women interviewed had received a fair amount of schooling, 397, or about two-thirds, having completed the eighth grade, and 93 had also attended high school or college.

When, with a fairly good education to start with, a woman is receiving very low wages, particularly after several years' industrial experience, it may be safely concluded that something is radically wrong either with her training or with the industrial system. It was, therefore, disconcerting to find that so many of the women with good schooling were receiving such low wages even after five years or more in the working world. Of the 238 having eighth grade or higher education who had been at work for five years or more, 57, or 24 per cent, were receiving under \$9 a week, and 84, or 35 per cent, were receiving under \$10. Of 10 women with college training, only 4 (all United States Government employees) were receiving more than \$15 per week, and 4 others were receiving under \$12 a week. Three of these latter four were employed as saleswomen, one because teaching had been too great a nervous strain for her.

The following table classifies the 374 women who had been at work for five years or more by wage and amount of schooling. This table gives data for all occupations combined. Table 3, at the end of the article, gives the same information by separate employments.

WEEKLY WAGES OF 374 WOMEN WHO HAD BEEN AT WORK AT LEAST 5 YEARS,
CLASSIFIED ACCORDING TO AMOUNT OF SCHOOLING.

Weekly wages.	Number of women having specified amount of schooling.								
	Total.	1st, 2d, or 3d grade.	4th or 5th grade.	6th or 7th grade.	8th grade.	1st or 2d year in high school.	3d or 4th year in high school.	College.	Nor- mal.

**REPORT OF PRESIDENT'S MEDIATION COMMISSION, CONDEMN-
ING DEPORTATIONS FROM WARREN DISTRICT OF ARIZONA.**

The mediation commission appointed by the President to promote peaceful industrial relations has submitted its findings and recommendations in regard to the labor disturbance which occurred in the copper-mining industry, in the Warren district of Arizona, during June and July, 1917. This disturbance culminated in the rounding up of 1,186 men and their deportation to Columbus, N. Mex., by the sheriff of Cochise County and his deputies.

According to the Official Bulletin for November 27, 1917, the President has acted on the recommendation that certain features of the report be referred to the Attorney General and to the Interstate Commerce Commission.

Following is the report in full:

BISBEE, ARIZ., *November 6, 1917.*

THE PRESIDENT:

The deportations on the 12th of July last from the Warren district of Arizona, as well as the practices that followed such deportations, have deeply affected the opinions of laboring men, as well as the general public, throughout the country. These events have even been made the basis of an attempt to affect adversely public opinion among some of the people of the Allies. Their memory still embarrasses the establishment of industrial peace for the period of the war, and it is indispensable to obtain and maintain industrial peace if the war is to be brought to the quickest possible successful conclusion and if lives are not to be needlessly sacrificed.

SAFEGUARDING THE FUTURE.

The President's mediation commission is charged rather with helping to secure peaceful industrial relations for the future than to sit in judgment upon the errors of the past. But it is impossible to make for peace in the future unless the recurrences of such instances as the Bisbee deportations are avoided. The future can not be safeguarded against such recurrences unless a candid and just statement is made of the facts surrounding the Bisbee deportation and an understanding is had of the conditions which brought it about. Such candor is necessary for the guidance of all in their future conduct. Such candor is also necessary because if the truth be authoritatively set forth there will be no basis for any misrepresentation of the facts either through ignorance or design.

The President's mediation commission has therefore deemed it a duty which it could not avoid to undertake a thorough and impartial consideration of the facts surrounding the deportations of the 12th

of July and the practices which have been pursued since the deportation by officials and citizens of Cochise County.

FINDINGS BY COMMISSION.

After hearing the representatives of the different elements involved in the deportation, both official and private, the President's mediation commission makes these findings:

(1) A strike was called in the Warren district on June 26, 1917, to be effective the following day. While undoubtedly the men sincerely felt that several grievances called for rectification by the companies, having regard to the conditions in this district and the Government's need for its copper production, the grievances were not of such a nature as to have justified the strike. Here, as elsewhere, there was, however, no machinery for the adjustment of difficulties between the companies and the men which provided for the determination of alleged grievances by some authoritative and disinterested tribunal in which both the companies and the men had confidence and before which they had an equal opportunity of urging their respective claims. This is a fundamental difficulty in the settlement of grievances that may arise in this district, and here, as in the other mining camps in Arizona visited by the President's mediation commission, a plan has been worked out establishing such machinery whereby in the future, at least during the period of the war, grievances will be settled by an orderly, impartial process, and the resort to strike or lockout will be wholly without foundation.

NOT ALL IN SYMPATHY.

(2) Many of those who went out did not in fact believe in the justice of the strike, but supported it, as is common among workingmen, because of their general loyalty to the cause represented by the strikers and their refusal to be regarded in their own estimation, as well as in the minds of fellow workers, as "scabs."

(3) Shortly after the strike was called the sheriff of the county, through the governor of Arizona, requested the aid of Federal troops. The request was based on the fact that the State militia had been drafted into the Federal service and the State, therefore, was without its normal militia protection. Gov. Campbell recommended to the Secretary of War that an immediate investigation of the situation at Bisbee be made by a Regular Army officer in order to ascertain the need of troops. The governor's recommendation was followed and an investigation of the situation in Bisbee was made by an experienced officer. Such investigation was made on June 30 and again on July 2, and after both investigations the officer reported that every-

thing was peaceable and that troops were neither needed nor warranted under existing conditions.

(4) That the conditions in Bisbee were, in fact, peaceful and free from any manifestations of disorder or violence is the testimony of reputable citizens, as well as of officials of the city and county, who are in a position to report accurately and speak without bias.

DEPORTED FROM WARREN DISTRICT.

(5) Early on the morning of July 12 the sheriff and a large armed force presuming to act as deputies under the sheriff's authority, comprising about 2,000 men, rounded up 1,186 men in the Warren district, put them aboard a train, and carried them to Columbus, N. Mex. The authorities at Columbus refused to permit those in charge of the deportation to leave the men there, and the train carried them back to the desert town of Hermanas, N. Mex., a nearby station. The deportees were wholly without adequate supply of food and water and shelter for two days. At Hermanas the deported men were abandoned by the guards who had brought them and they were left to shift for themselves. The situation was brought to the attention of the War Department, and on July 14 the deportees were escorted by troops to Columbus, N. Mex., where they were maintained by the Government until the middle of September.

(6) According to an Army census of the deported men 199 were native-born Americans, 468 were citizens, 472 were registered under the selective-draft law, and 433 were married. Of the foreign born, over 20 nationalities were represented, including 141 British, 82 Serbians, and 179 Slavs. Germans and Austro-Hungarians (other than Slavs) were comparatively few.

PLANNING OF THE DEPORTATION.

(7) The deportation was carried out under the sheriff of Cochise County. It was formally decided upon at a meeting of citizens on the night of July 11, participated in by the managers and other officials of the Copper Queen Consolidated Mining Co. (Phelps-Dodge Corporation, Copper Queen division) and the Calumet & Arizona Mining Co. Those who planned and directed the deportation purposely abstained from consulting about their plans either with the United States attorney in Arizona, or the law officers of the State or county, or their own legal advisers.

(8) In order to carry the plans for the deportation into successful execution, the leaders in the enterprise utilized the local offices of the Bell Telephone Co., and exercised or attempted to exercise a

censorship over parts of interstate connections of both the telephone and telegraph lines, in order to prevent any knowledge of the deportation reaching the outside world.

NO VIOLENCE BY THE STRIKERS.

(9) The plan for the deportation and its execution are attributable to the belief in the minds of those who engineered it that violence was contemplated by the strikers and sympathizers with the strikers who had come into the district from without, that life and property would be insecure unless such deportation was undertaken, and that the State was without the necessary armed forces to prevent such anticipated violence and to safeguard life and property within the district. This belief has no justification in the evidence in support of it presented by the parties who harbored it.

(10) Neither such fear on the part of the leaders of the deportation as to anticipated violence nor evidence justifying such fear was ever communicated to the governor of the State of Arizona with a view to renewing the request for Federal troops, based upon changing conditions, nor were the Federal authorities in fact ever apprised that a change of conditions had taken place in the district from that found by the investigating Army officer to call for or warrant the interposition of Federal troops.

DEPORTATION WHOLLY ILLEGAL.

(11) The deportation was wholly illegal and without authority in law either State or Federal.

(12) Following the deportation of the 12th, in the language of Gov. Campbell, of Arizona, "the constitutional rights of citizens and others have been ignored by processes not provided by law, viz, by deputy sheriffs who refused persons admittance into the district and the passing of judgment by a tribunal without legal jurisdiction resulting in further deportations."

(13) Immediately after the first deportation, and until late in August, the function of the local judiciary was usurped by a body which to all intents and purposes was a vigilance committee, having no authority whatever in law. It caused the deportation of large numbers of others. So far as this committee is concerned, its activities were abandoned at the request of the governor of Arizona late in August.

(14) Among those who were deported from the district and who thereafter were arrested in seeking entrance into it were several who were registered under the selective-draft law and sought to return or remain in the district in order to discharge their legal duty of reporting for physical examination under the draft.

"RECOMMENDATIONS MADE INEVITABLE."

These findings of facts make certain recommendations by the President's mediation commission inevitable.

1. All illegal practices and the denial of rights safeguarded by the Constitution and statutes must at once cease. The right of unimpeded admittance into the Warren district of all who seek entrance into it in a lawful and peaceable manner must be respected. The right of all persons freely to move about in the Warren district or to continue to reside within it must be scrupulously observed except in so far as such right is restricted by the orderly process of the law. To this end we have directed letters to Gov. Campbell and Sheriff Wheeler, of Cochise County.

2. In so far as the deportation of July 12 and the events following constitute violations of the laws of Arizona, we join in the recommendation of Gov. Campbell that the responsible law officers of the State and county pursue appropriate remedies for the vindication of such laws.

3. In so far as the evidence before the commission indicates interference with the enforcement of the selective-draft law, the facts should be brought to the attention of the Attorney General of the United States.

4. In so far as the evidence before the commission indicates an interference with interstate lines of communication, the facts should be submitted for appropriate attention by the Interstate Commerce Commission.

5. In so far as deportations such as we have set forth have not yet been made a Federal offense, it is our duty to report to the President the wisdom of recommending to the Congress that such occurrences hereafter be made criminal under the Federal law to the full extent of the constitutional authority of the Federal Government.

Respectfully submitted.

THE PRESIDENT'S MEDIATION COMMISSION.

W. B. WILSON, *Chairman.*

Counsel to the Commission.

TRADE AGREEMENTS IN THE MEN'S CLOTHING INDUSTRY OF NEW YORK CITY.

BY MATTHEW E. GORMLY.

The situation as regards labor conditions in the men's clothing industry in New York City is greatly affected by three outstanding factors—the war, the cessation of immigration, and the split in the ranks of the union garment workers. The first factor, due to the large Government orders for uniforms and other clothing, has created an increasing demand for clothing workers; the second factor has cut off, almost absolutely, the foreign supply of such workers; while the third has made it difficult for the workers to take advantage of the strategic position resulting from the first two and act as a unit to improve working conditions through the instrumentality of collective bargaining.

Our entrance into the war has had a double effect on the men's clothing industry, one neutralizing in a measure the other. The calling of thousands of young men from civilian pursuits to military work naturally resulted in a lessened demand for civilian clothes. This more particularly so because the young man of military age represents the greatest purchasers of men's clothes. Simultaneously, however, with the falling off in the demand for civilian clothes came the demand for vast quantities of military clothing. This latter demand has in New York City been more than sufficient to make up for the decrease in the demand for civilian clothes. Not only has it given full employment to those normally engaged in the manufacture of men's clothing but it has also provided steady employment for the casual workers of the trade. It has thus had a tendency to wipe out the long periods of unemployment so characteristic of the garment trades, an evil which the workers of the industry have always had to contend with and provide against. War orders have had the further effect of giving employment to workers who have never before worked on men's garments. Hundreds, and perhaps thousands, since the number increases daily, of cloak and suit operatives are being employed on uniforms, and many of the workers on other women's garments, such as dresses and waists, are finding employment in the making of cotton uniforms, shirts, barrack bags, etc. Thus the war has tended greatly to increase the number of people employed in the men's clothing industry in New York City.

This increased work, however, has not been accompanied by an orderly expansion of, but has rather resulted in a considerable upsetting and shifting within, the industry. Military work is different from civilian work. Concerns doing military work usually have to put in new machines, since the stitching is different from that on civilian garments. There is also very much less hand tailoring on military work, with a corresponding increase in machine operations. Because of this latter fact, together with the fact that the uniform calls for no vest, there has resulted a lack of employment for two classes of specialized workers—the hand tailors and the vest makers. The vest makers can find employment making trousers, while the less efficient tailors must specialize in operating if they are to continue working in the industry. Thus, besides the increased employment which the military work has brought about, there is, as a result of the same cause, a general shake-up and readjustment going on within the industry.

The second factor contributing to the abnormal situation in the men's clothing industry is the cessation of immigration. Prior to the outbreak of the present war the principal source of the labor supply of the clothing industry was foreign immigration, principally from Russia and Italy. Great numbers of these foreigners have arrived each year in New York City and, lacking funds to go elsewhere, and desiring to stay near their friends, they have glutted the local labor market. Though there were a few tailors among them, the vast majority was unskilled. This large number of workers, able to learn the rudiments of the trade in a short time, kept a constant oversupply of potential garment workers in this market. The fierce competition for employment resulting from this condition, together with the seasonality of the industry, made organized effort next to impossible and stability hardly to be hoped for. The manufacturers had very little capital invested and were just as eager in business competition among themselves as the immigrants they employed were for work. The small capital needed to set up in the clothing business, together with the abundance of cheap labor, resulted in hundreds of small manufacturers springing up, until to-day there are about 2,500 manufacturers employing about 65,000 workers, making New York City the largest center of the manufacture of men's clothing in the country.

The vast reserve of clothing workers has gone. The normal expansion of the industry was not sufficient to use up the reserve at once, and no real shortage of clothing workers was felt until very recently, when the placing of large Government contracts for military work produced an abnormal demand for labor. The present shortage of workers creates an entirely new and unusual condition

in the industry. For the first time the workers are in a position where they can demand more and have a fair chance of getting it without having to work on the sympathies of the public. For the first time they hold the strategic position. This reversal of relative positions of employer and employee has had its effect on their respective attitudes toward trade agreements. The employer now wants to come to an agreement with the union, but the workers are not so anxious. While in normal times they might be willing to enter into an agreement, when they are in a strong position, as at the present time, with conditions so unstable, they desire to be unfettered. The individual worker can strike a good bargain now. He does not need the collective action of the union. Thus the shortage of workers caused by the cutting off of immigration has developed an attitude of independence in the worker which is detrimental to collective agreements.

The third factor which affects the labor conditions in this industry has perhaps a more direct influence on the status of trade agreements than the other two. Without attempting to give the history of the split in the ranks of the men's garment workers, or the merits of the claims of either side, it can be stated that, in New York City at least, each faction has a considerable membership and has been able to negotiate some agreements with associations and individual employers. A large part of the men's garment workers, however, are not working under any agreement. The older organization of garment workers is known as the United Garment Workers of America and is a union affiliated with the American Federation of Labor. The newer faction is made up of the more radical element of garment workers who seceded from the parent organization after the Nashville convention in the fall of 1914 and have since maintained an international organization called the Amalgamated Clothing Workers of America.

The United Garment Workers of America have for many years past entered into agreements with certain manufacturers of clothing, whereby the manufacturer, in return for the right to put a union label on his garment, agreed that union conditions would prevail in his factory. The theory is that men sufficiently interested in organized labor would demand clothing made under union conditions, and the label is the guaranty. The label agreement is in a form stipulated by the union, is printed, and is adhered to absolutely in every part of the country. By this agreement the employer binds himself to run a strictly union shop, employing only members of the United Garment Workers of America. This agreement also provides that 48 hours shall constitute the working week; that children under 16 shall not be employed; that the work shall be distributed equally among the workers during the slack season; that the machines used must be run

by mechanical power, and must be owned by the employer; and that proper sanitary conditions must be maintained, and the provisions of the State factory laws lived up to. On its part the union agrees to advertise the clothing of employers using the label. Provision is made in the agreement for the settlement of disputes. It provides that all disputes that can not be settled by the employer and his employees shall be referred to the general officers of the United Garment Workers of America. In case the latter are unable to effect a settlement the question is to be submitted to an "umpire to be mutually selected for final decision." The agreement does not specifically state that there shall be no strikes or lockouts, but that there shall be none is perfectly understood by both parties. In the matter of wages the different manufacturers agree to pay the union scale. This scale is attached in a supplement to the label agreement and remains in force during the life of such agreement. This scale is elaborately worked out in detail, based on the experience of several years. The prices for the several operations, since most of the workers are paid on a piecework basis, are enumerated in a printed pamphlet. Such modification as may be necessary to meet the conditions in a given shop are made and embodied in the supplement to the agreement.

There are three classes of manufacturers who use the label of the United Garment Workers of America—the manufacturers of ready-made clothing, the special-order houses, and the makers of mechanics' clothing. Under the head of "ready-made" clothing manufacturers are included those who make clothing to sell to the jobber or retailer to be sold off the counter. The "special-order" houses are those who make clothing after the wearer's order has been taken. They are sometimes called the "made-to-measure" or "tailor-to-the-trade" houses. The manufacturers of mechanics' clothing are those making overalls, workmen's trousers, workmen's shirts, duck coats, etc. This latter class represents the largest group using the label. In the city of New York the label of the United Garment Workers is used by 11 manufacturers of ready-made clothing, three manufacturers of clothing on special orders, and six manufacturers of mechanics' clothing. In all they employ about 2,500 workers.

The United Garment Workers of America have been making agreements with manufacturers involving the use of the union label for more than 20 years, the number of agreements and the number of workers covered by them varying from year to year. The agreements are made for one year, but renewal is very often automatic unless some change in conditions is desired. There seems to be general satisfaction with the workings of these agreements, both on the part of the union and on the part of the employers. Both are agreed

that labor strife is reduced to a minimum. They regard the agreement as a binding contract and try to live up to the spirit of it. The union has at different times asked for increases in wages during the life of an agreement, but such cases have been rare and due to unusual conditions. Union officials and manufacturers are unanimous in stating that such controversies as arise pertaining either to wages or other conditions have invariably been settled in a spirit of accommodation and without recourse to industrial warfare.

In addition to their label agreements the United Garment Workers of America have entered into oral "understandings" with several manufacturers who were unwilling to bind themselves absolutely to all the conditions asked by the union. These manufacturers agreed to maintain union shops and the union scale of wages, but often balked at closing their shops to nonunion workers. Such understandings are not considered "agreements" by the union officials, but often act as a wedge, resulting subsequently in written agreements containing all the provisions asked by the union.

Written agreements with seven associations of manufacturers in New York were negotiated by the United Garment Workers of America in 1913, after a big strike in the men's clothing industry. These associations were The Boys' Clothing Manufacturers of Greater New York, The Boys' Wash Suit Manufacturers' Association, The Metropolitan Merchant Tailors' Association, The East Side Retail Clothing Manufacturers' Association, The New York Clothing Trades' Association, The Tailors to the Trade Association, and the American Clothing Manufacturers' Association, the latter three being grouped in one agreement. These five agreements covered about 25,000 employees, or a little less than half of the industry in New York City. The agreements did not involve the use of the union label, but rather were intended to provide the beginnings of a plan to insure better relations between employer and employee, and thus to benefit the industry as a whole.¹

The factional disputes that arose within the ranks of the union workers and which ended in the secession movement previously mentioned, together with a lack of enthusiasm for the agreements on the part of the employers, practically vitiated the agreements and nullified the start that began so auspiciously in the early spring of 1913. The United Garment Workers have not since renewed these agreements. By the summer of 1915, however, the Amalgamated Clothing Workers had gained sufficient strength to warrant entering into negotiations with some of the associations, and new agreements resulted. These agreements cover two classes of employers—the

¹ These agreements are described in Bul. 198 of the U. S. Bureau of Labor Statistics.

manufacturers of boys' clothing and the manufacturers of men's clothing.

Under the agreement between the Associated Boys' Clothing Manufacturers and the United Garment Workers, signed in 1913, the hours of labor in the boys' clothing industry were reduced to 50. The agreement was so far disregarded, however, that by December, 1915, the prevailing hours were 52, and in many shops more; wages had been reduced, and conditions were almost as bad as before the strike. The Amalgamated Clothing Workers called a strike in that month, and after being out five days, signed, on December 20, an agreement with the association which was to remain in force until April 1, 1918. The association is composed of 69 members, employing, together with the contractors who work for them, about 8,000 workers, or approximately two-thirds of the workers in the boys' clothing industry in New York City. Of the 8,000, about 2,000 work in the inside, or manufacturers', shops, and about 6,000 in outside, or contractors', shops. The manufacturers of the association are bound to employ only such contractors as maintain conditions in their shops equivalent to those provided in the agreement. This agreement fixed the hours at 49, and provided for increases of from 50 cents to \$1 a week for operatives, an increase of \$1 a week for cutters receiving less than \$21, and \$1 a week for examiners receiving less than \$14. Strikes and lockouts were prohibited, and both parties agreed to submit their differences to a committee on immediate action, which was to be composed of five members, two chosen by each of the parties to the agreement and the chairman, to be an impartial outsider. This committee selected a subcommittee of two to take up first the disputes and try to settle them. In practice this subcommittee is made up of the manager of the association, who is called the labor adviser, and the manager of the joint board of children's clothing of the union. Such disputes as have arisen, excepting those affecting hours and wages in the trade generally, have been settled amicably by this subcommittee in a more or less informal way. Questions regarding hours and wages were referred to a special committee.

In November, 1916, the union asked for a reduction of hours to 48, and a flat increase of \$2 a week. After hearings and consideration of the question by a special committee chosen for the purpose, a decision was reached modifying the agreement to the extent of shortening the hours to 48 and granting a flat increase of \$1 a week. The week's work still remains at 48 hours, but during the past year several increases in wages have been granted, approximating a general increase of 25 per cent. It seems to be the opinion of both parties that the agreement works well. There have been no strikes or lockouts, and such illegal stoppages as have occurred have been

ended quickly by the action of the union. The union is satisfied with the agreement because it has obtained better conditions under it, but some manufacturers are inclined to believe that, had there been a greater supply of workers, the agreement would not have worked so well.

The Amalgamated Clothing Workers of America are at the present time negotiating an agreement with the Washable Sailor Suit Manufacturers' Association. This association is composed of nine members, employing about 700 in their inside shops and about 1,000 in contractor's shops. It is expected that the hours will be fixed at 50 a week, and an increase of 12 per cent granted. Definite information regarding this agreement can not be given pending its signing, which is expected very soon.

In the branch of the industry engaged in the manufacture of clothing for men there was the same breaking down of the agreements of 1913 that was found in the boys' branch. Again hours were increased and wages reduced. In the summer of 1915 the Amalgamated Clothing Workers called a general strike, which resulted in a new alignment of forces and a new agreement. The American Clothing Manufacturers' Association, an organization of manufacturers that was formed at the time of the 1913 strike to deal with labor problems, signed the agreement with the Amalgamated. This association has 80 members and employs, both directly and through contractors, approximately 25,000 workers, or a little more than half the total workers in this branch of the industry. The vast bulk of these workers are in contract shops, the manufacturers employing directly only the cutters and trimmers. Most manufacturers, though not all, maintain relatively small establishments. In these the cloth and trimmings are cut and assembled. The work is then given out to other factories to be made at a price agreed upon by the manufacturer and the contractor. The contractor is virtually a foreman. He has a small shop set up on very small capital, or on money lent by the manufacturer. He takes work on a very small margin of profit, employs the necessary help, and personally supervises the making. His methods are usually inefficient, so that his only chance of increasing his profits is by taking it out of the workers. This method of manufacturing by letting out a large part of the work of making to contractors is characteristic of the industry, and gives rise to one of the greatest obstacles to a successful adjustment of the labor difficulties of the trade.

It is evident that if the workers are to be protected it must be in the contracting shops. But the contractors are, as a whole, irresponsible, and agreements made with them could hardly be enforced. The union, recognizing this, has sought to enforce its conditions in con-

tracting shops through the manufacturers who employ the contractors. The agreement entered into with the American Clothing Manufacturers' Association on July 20, 1915, at the settlement of the strike, recognized this condition, and bound the members of the association to give work to those contractors only who maintained in their shops the standards agreed upon by the association and the union. This agreement provided that the strikers return to work, and that 50 per cent of the reductions in prices made since the settlement of the 1913 strike be restored to all coat and pants workers, and that the total reduction be restored to vest makers. It provided that the principle of the union shop be recognized throughout the industry upon the creation of standards, and that work be given only to the contractors maintaining union shops. The machinery for determining the standards, and the machinery for settling disputes is also provided as follows: A committee of five chosen by both sides with an impartial chairman, and to be known as the "Committee on Standards," to settle the matter of standards; a "Committee on Immediate Action," composed of five representatives chosen by each side with an impartial chairman, to settle all matters in dispute; and a standing subcommittee of the latter composed of one representative of each side and known as the "Committee of Two," which shall try to settle all individual disputes before referring them to the "Committee on Immediate Action." Further, both sides agreed to organize a "Council of Moderators," to be composed of three members selected by the union, three selected by the association, and three chosen by both parties from the public at large. This council was to consider all matters affecting the industry as a whole. Strikes and lockouts were prohibited pending the adjustment of disputes.

The agreement was apparently entered into in good faith by both sides. The committees were chosen, but little was accomplished except by the Committee of Two. The Committee on Standards failed to accomplish its object, and little or nothing has come up before the other committees. The Committee of Two, however, which is made up of the managing director of the American Clothing Manufacturers' Association and the chairman of the New York Joint Board of the Amalgamated Clothing Workers of America, has been able to settle all disputes that have arisen. The agreement was to be in force until November 1, 1916, at least. It has not yet been renewed, but the machinery established by it has been continued, and disputes that have arisen since then have been settled by the Committee of Two as under the agreement. It is estimated that about 250 disputes arise and are settled each week.

A new agreement between the American Association and the Amalgamated has been drawn up and ready for signing for some

few months. Its provisions are generally being lived up to, but the actual affixing of signatures has been put off time and again. The manufacturers' association is willing and anxious to sign it, but the union is disposed to delay. This attitude on the part of the union can be explained by the abnormal conditions in the industry. As has been said, a readjustment is going on within the industry and employment is plentiful. The supply of workers is short, and wages generally are going up. With such conditions a binding agreement is not as desirable from the workers' point of view as under ordinary conditions. In fact the desire to be free to take advantage of any situation that might arise is quite a natural one, and the union is not likely to hurry to sign the new agreement.

The Amalgamated has an agreement with one concern, employing about 1,500 people, which is also a member of the American Association. The agreement is for the calendar year 1917, and, besides providing for 48 hours and an increase of \$1 a week, provides machinery for settling disputes without the aid of the association. Each shop controlled by the company has its shop committee, composed of a representative of the company and one of the workers in the shop. This committee has original jurisdiction in all complaints. In case the shop committee fails to effect a settlement the matter is referred to a board of arbitration, composed of a representative of the company, one of the union, and a third member agreed upon by both. This agreement has worked satisfactorily to both parties. The Amalgamated also has an agreement with one other individual concern employing about 500, but which is not a member of the American Association. This agreement is merely a written statement that the company will arbitrate all disputes, but it provides no machinery.

Looking at the men's clothing industry in New York City as a whole, it is apparent that peaceful relations between employer and employee are being maintained. Slightly more than half of those employed in the industry are working under agreements, written and unwritten, but practically the entire industry is working union hours and receiving approximately the union scale. While the agreements have had some influence in bringing about these conditions, it is more than probable that the abnormal activity caused by the war is mostly responsible for the present conditions. The influx of war orders seems to be the outstanding feature of the industry to-day. It is estimated that 60 per cent of the workers on boys' clothing, 40 per cent of those on men's clothing, and nearly half of those on overalls and shirts are now engaged in making uniforms or some other garment for war use by the Government.

TRADE AGREEMENTS IN THE WOMEN'S CLOTHING INDUSTRIES OF PHILADELPHIA.¹

BY BORIS EMMET, PH. D.

A study of the present workings of trade agreements in the women's clothing trades of Philadelphia confirms a general statement made in an article which appeared in a previous issue of this REVIEW, dealing with the workings of trade agreements in the women's clothing industries of New York City² to the effect that the curtailment of the labor supply of these industries, attributable to the cessation of immigration and the increased demand for needle-trade workers caused by the war, has had a profound influence upon the relative strength of the positions of labor and capital in the driving of wage bargains. In the article mentioned it was pointed out that unlike what happened in the days of unrestricted immigration, the garment manufacturers during their busy seasons no longer enjoy the advantage of a superabundance of labor, accompanied by a cut-throat competition for jobs among the workers. The war demand for needle hands has more than offset the somewhat diminished activity in women's ready-to-wear garment trades caused by war economy and by the increased cost of clothing on account of the dearth of materials and labor.

Conditions similar to those in New York were found prevailing in the city of Philadelphia. The effects of a curtailed supply of labor began to be felt in that city during the busy season of the summer of 1916. Its intensity has greatly increased since our entry into the war, which brought to many of the women's garment manufacturers increasingly numerous contracts for military clothing, such as khaki garments, cotton underwear, mattress bags, etc. The abundance of available work and the consequent shortage of hands during the busy seasons strengthened greatly the bargaining power of labor and weakened the force of resistance of the employers. Trade agreements, which were rather unpopular before, are now favored by them "as the only effective method of putting the demands of labor within the bounds of reason and outside the range of daily demands for a change."

The position of labor has particularly been strengthened in the dress and waist industry, which, aside from enjoying a normally

¹ This article is a preliminary summary of one of the phases of a study on trade agreements to be published by this bureau in the future. A similar article dealing with trade agreements in the women's clothing industries of New York City appeared in the MONTHLY REVIEW of December, 1917.

² MONTHLY REVIEW, December, 1917, p. 20.

busy season, is doing a considerable amount of war work.¹ This fact, more, perhaps, than any other, may be stated to account for many of the valuable concessions made by the Dress and Waist Manufacturers' Association of Philadelphia to its organized employees. Special mention is made below of the fact that the agreement in operation in this trade at the present time did not originally provide special privileges to members of the union in either hiring or laying off, but that, as a matter of fact, the agreement resulted in a complete unionization of the association shops. Such a condition, it was stated, came about through an obligation assumed by the employers to compel their employees, under the threat of discharge, if necessary, to keep in good standing with their union.

Different reasons are given by those concerned for this valuable concession to the workers. Union officials give due credit for it to the present management of the manufacturers' association, which, it is said, has a keen insight into labor matters and realizes that no agreement is workable without effective organization, and understands at the same time the futility of expecting union officials to direct effectively the actions of workers not affiliated with their organization. Giving due credit to the employers' association for this farsighted policy, one must keep in mind the fact that by the fall of 1916, when the concession referred to was granted, the position of labor was particularly strong on account of its limited supply caused by the cessation of immigration and the consequent increased demand for needle trade workers.

With our entry into the war the increased demand for needle hand labor in the city of Philadelphia was greatly intensified. It resulted in a movement of garment workers from the less busy branches of the needle trades to those in which, on account of war orders, employment was more plentiful. The great demand for workers ushered in a movement of workers from the cloak and suit industry, in which the manufacturing activity, for reasons stated below, has greatly diminished, to other needle industries such as the dress and waist trades, but particularly to trades engaged in the making of men's clothing.²

A similar movement, but flowing in the opposite direction—from the men's needle trades to the women's—exists in some of the other

¹ The dress and waist manufacturers secured contracts for mattress sacks, various kinds of bags, khaki garments, cotton underwear, and, in some instances, for trousers, coats, and overcoats. The subdivision of labor introduced in the manufacture of military clothing as well as the application of new machinery reduced greatly the amount of tailoring skill required and thus enabled dress and waist makers to become tailoring operatives.

² It is reported on reliable authority that approximately one-half of all the women's garment workers of Philadelphia are at the present time employed on war work of some sort. Instances are known of cloak makers who have deserted their trade altogether for more remunerative and steady employment in munition factories, which are abundant in this locality.

garment industries of the city. Considerable numbers of men's tailors and clothing workers are finding employment in dress and waist establishments which have taken contracts for military clothing or accessories the manufacture of which requires the services of needle hands.

The sudden movement of workers from trade to trade brought new difficulties to the labor organizations. These were confronted with the necessity of formulating a definite policy with reference to the treatment of members leaving the jurisdiction of their respective organizations. Trade-unions with original jurisdiction in the men's clothing trades, as well as those operating in the women's needle trades, were unwilling to give up their claims to the membership of those of their members who, temporarily, perhaps, were finding employment in other needle trades.

The flow of workers from one branch of the needle trades to another and from the men's trades to the women's or vice versa has at the present time assumed sufficiently large proportions to warrant the establishment of a special organization of workers on military garments. Such a trade-union has recently been established in the city of Philadelphia. The new organization is under the joint jurisdiction of the International Ladies' Garment Workers' Union and of the Amalgamated Clothing Workers of America, a national union with jurisdiction in the men's clothing industry.

CLOAK AND SUIT INDUSTRY.

Prior to 1913, the workers of the cloak and suit industry of Philadelphia were poorly organized. Collective bargaining, although in existence, was confined to a few small shops and was not very effective. A general strike was called in the industry in July, 1913. The workers demanded recognition of their union, and collective bargaining. This strike lasted for six months, caused great losses to both sides, but failed to achieve its purposes. It was officially called off on December 16, 1913. This prolonged and bitter struggle resulted in a great disorganization of the cloak industry and entailed the loss of trade orders which have never come back to the Philadelphia market.

Another general strike was about to be called the following September, but was prevented by the efforts of the city authorities, who assisted the parties in reaching an understanding. The terms of the final settlement were drawn up by a board of arbitration agreed to by both sides.

As a result of this settlement two separate trade agreements were signed. One of these was with the Women's Wear Manufacturers' Association of Philadelphia, an employers' association with a mem-

bership of about 40 small employers. The other agreement was signed with the Women's Garment Manufacturers' Association of Philadelphia, which had a membership of about 60, included in which were the largest employers in the trade. In both of these agreements the workers were represented by the Joint Board of Cloak and Skirt Makers' Unions, consisting of representatives of Locals Nos. 2, 53, and 69, and of the International Ladies' Garment Workers' Union.

The agreements were essentially the same. Each provided for a 52-hour week, greatly restricted overtime work, specified minimum rates of wages for week and piece workers, outlawed strikes and lockouts, instituted agencies for collective piece-rate making, as well as for the peaceful adjustment of grievances, and obligated each of the parties to assist the other in the maintenance of safe and sanitary workshops. It further specified that during the dull seasons available work was to be distributed equally among all employees, and that members of the union were not to be discriminated against.

The principal point of distinction between the two agreements was as follows: Under the agreement with the first-mentioned association, which consisted of very small employers, the workers did not obligate themselves to work on "unsettled" garments—that is, on garments for the making of which no satisfactory piece rates were arranged. The agreement with the larger employers specified that workers were not to cease working pending the adjustment of piece rates. This point of distinction between the two agreements is important because it indicates the relative strength of the union when confronted with different types of employers. The union was always able to bring the smaller employers to terms without any special concessions. All the intensive and costly industrial struggles of the previous years were carried on principally against the larger employers, who, up to that time, were victorious over the workers. This fact furnishes the reason for the special concession which the union was compelled to grant to them.

The settlement which resulted in the agreements mentioned did not, however, bring about effective collective bargaining in the industry. The agreements did not work. Officials of the union complained of failure on the part of many employers to live up to many of the provisions and of the fact that the employers' associations were not in a position to discipline their members for the violations. It was further said that decisions of the authorities mutually agreed to were not complied with if in favor of the union. Not all the dissatisfaction, however, came from the union side. Employers frequently complained of failure on the part of the union to keep its promise to refrain from striking and of the fact that individual members of the

union seldom heeded the advice of their officers to remain at work pending a peaceful adjustment of differences.

The agreements quietly went out of existence. By 1917 no trade agreements of any sort were in existence between the organized manufacturers and the union. Collective bargaining was confined to a few small establishments, the owners of which did not belong to any of the employers' associations.

In the spring of 1917 the two manufacturers' associations of the industry consolidated into one—the Women's Garment Manufacturers' Association of Philadelphia. Shortly thereafter, during the month of May, officials of this association requested a conference with the union for the purpose of formulating a new agreement. Such an agreement was signed on August 1, for a term of two years, between the Women's Garment Manufacturers' Association of Philadelphia, with a membership of about 30 and total employees of about 2,000, and the Joint Board of Cloak and Skirt Makers' Unions of the city of Philadelphia. The principal features of this agreement are shown in its text, which is reproduced herewith:

AGREEMENT OF AUGUST 1, 1917.

This agreement made and entered into this first day of August, 1917, by and between the Women's Garment Manufacturers' Association of Philadelphia, hereinafter styled the "Association," and the International Ladies' Garment Workers' Union, and the Joint Board of the Cloak and Skirt Makers' Unions of the city of Philadelphia, composed of Locals Nos. 2, 53, and 69, all collectively designated as the "Union," contracting herein for and in behalf of the said unions and for and in behalf of the members thereof now employed and hereafter to be employed by the members of the Association;

Witnesseth:

Whereas, the Association is composed of a large number of manufacturers engaged in the cloak, suit, and skirt industry in the city of Philadelphia, and the union represents the workers in the said trade, and

Whereas, the parties hereto desire to establish terms and conditions under which members of the union shall work for members of the Association:

Now, therefore, the parties hereto agree as follows:

1. The regular working-day shall consist of forty-nine (49) hours in six (6) week days, divided as follows: On the first five working days of the week the work shall begin at eight (8) o'clock a. m. and continue until twelve (12) m. and from one (1) o'clock p. m. to six (6) o'clock p. m. On Saturdays work shall be done from eight (8) o'clock a. m. until noon.

2. (A) No overtime shall be exacted or permitted between May 15th and July 15th, nor between November 15th and February 1st, nor so long as there are vacant accommodations in the shop for additional workers and competent workers can be promptly obtained.

(B) In the season in which overtime is permitted, such overtime shall not exceed eight (8) hours in any week, nor two (2) hours in any day, and shall be restricted to the first four working days of the week. No overtime shall be allowed on Saturdays, except for the purpose of finishing and completing emergency orders. Abuse of the last-mentioned privilege on the part of the em-

ployer shall be subject to complaint and adjustment in the manner hereinafter set forth.

(C) Week workers shall be paid for overtime at the rate of one and one-half ($1\frac{1}{2}$) times the regular weekly wages.

(D) Employees shall not be required to work on New Year's Day, Independence Day, Labor Day, and Christmas, and there shall be no deduction from the pay of week workers for the aforesaid legal holidays. Employees may also refrain from work on the first day of May, but without pay.

3. (A) *Cloak and suit cutters*.—Cloak and suit cutters, competent to lay out, mark, and cut the goods with reasonable speed and economy shall be designated as "full-fledged" cutters, and their minimum wage shall be \$27.50 per week. Cutters who are not full-fledged shall be divided into three classes:

Class "A." Those who have worked at the trade not less than three years, and their minimum wage shall be \$22.50 per week;

Class "B." Those who have worked at the trade not less than two years, nor more than three years, and their minimum wage shall be \$20 per week;

Class "C." Those who have worked at the trade not less than one year, and their minimum wage shall be \$15 per week.

(B) All full-fledged cutters having heretofore received a wage of \$24 per week, or more, shall be raised up immediately to the minimum scale of \$27.50. All full-fledged cutters having heretofore received a wage of \$23 per week, or less, shall be raised up immediately to \$25 per week. All Class "A," "B," and "C" cutters shall immediately receive an increase of \$2 per week over their present wages.

4. *Skirt cutters*.—The minimum wage of full-fledged cutters on skirts shall be \$25 per week. Skirt cutters who are not full-fledged shall be divided into two classes:

Class "A." Those who have worked at the trade three years, and their minimum wage shall be \$20 per week;

Class "B." Those who have worked at the trade two years, and their minimum wage shall be \$18 per week.

All full-fledged cutters having heretofore received a wage of \$22 per week, or more, shall immediately be raised up to the minimum scale of \$25 per week.

All full-fledged cutters having heretofore received less than \$22 per week and all Class "A" and Class "B" cutters, shall immediately receive an increase of \$2 per week.

5. *Trimmers*.—Trimmers on cloaks and suits shall be divided into three classes:

Class "A" shall comprise competent trimmers who have worked at the trade not less than three years, and their minimum wage shall be \$24 per week;

Class "B" shall comprise those who have worked at the trade two years, and their minimum wage shall be \$20 per week.

Class "C" shall comprise those who have worked at the trade one year, and their minimum wage shall be \$15 per week.

All Class "A" trimmers shall immediately be raised up to the minimum scale of \$24 per week. All Class "B" and Class "C" trimmers shall immediately receive an increase of \$2 per week.

An employer employing only one cutter, or one trimmer, shall employ, if available, only the highest-priced man. If he employs two or more cutters or trimmers, then one out of every three or fraction thereof, of cutters or trimmers so employed, may be as to cutters of Classes "A," "B," and "C," and as to trimmers of Classes "B" and "C."

One apprentice who just enters the trade shall be allowed to every five cutters or trimmers.

6. *Sample makers*.—Sample makers on coats shall receive a minimum wage of \$23 per week.

Sample makers on skirts shall receive a minimum wage of \$20 per week.

Sample coat finishers shall receive a minimum wage of \$13 per week.

Button, hook and eye sewers and skirt bottom basters who are employed by the week shall immediately receive an increase of 10 per cent on their present wages.

7. (A) All prices to be paid to pieceworkers shall be agreed upon in advance between the employer and the price committee of the workers in his shop, in the presence of the shop chairman, and shall be adjusted as nearly as possible on the following minimum basis for each hour of continuous work for a worker of average skill:

For operators, 75 cents per hour.

For jacket upper pressers, 70 cents per hour.

For skirt pressers, 65 cents per hour.

For jacket underpressers, 60 cents per hour.

For finishers, 50 cents per hour.

The said hourly base rates shall not be considered either as a minimum or as a maximum but as a basis for settlement of piece prices.

(B) The price committee shall be elected by the employees at a regular shop meeting, if possible, from among workers who have been employed in that shop not less than one month.

(C) If the employer and the price committee fail to agree upon the prices of any garment or garments, then, upon request of either side, price adjusters furnished by both sides shall immediately be called in. Should the price adjusters fail to agree, they shall immediately agree upon an expert, who shall adjust the dispute within 24 hours and whose decision shall be final and binding on both sides.

(D) The workers shall not be required to work on garments on which prices have not been agreed upon in the manner above provided, except on emergency orders and only during the busy season, when the workers shall continue to work on the unsettled numbers until the prices on them will be fixed by the adjusters or price expert. The price adjusters or price expert must fix the prices on such unsettled numbers within 24 hours from the time the garments were put in work.

(E) All wages shall be paid weekly on a fixed day in cash.

8. The association agrees to cooperate in every way with the union in its effort to enforce proper standards of safety and sanitary conditions in the factories and the shops of the cloak and suit industry in the city of Philadelphia under its control.

No work shall be given to employees to be done at home.

9. (A) The association agrees that its members will maintain preferential shops; that is to say, shops in which the standards herein fixed shall be maintained, and wherein preference shall be given to members in good standing of Locals Nos. 2, 53, and 69 of the International Ladies' Garment Workers' Union in the employment of workers.

(B) Whenever there is insufficient work for all the employees of the shop, work shall be distributed as equally as may be feasible among all the employees.

(C) During the slack seasons when there is insufficient work for the usual number of employees, pieceworkers shall not be expected to report before 9 o'clock a. m.

10. (A) The employer shall have the absolute right to discharge any employee at any time during a period of two weeks of the beginning of his em-

ployment for incompetency or misconduct and such discharge shall not be subject to review. The first two weeks of employment shall be considered as a "trial period." After the trial period, no employee shall be discharged for any cause, except incompetency or misconduct, but the employee so discharged shall have the right to a review of the action of the employer as hereinafter provided.

(B) The employer shall be at all times free to select his employees at his discretion, subject to provision 10; in good faith to reorganize his shop whenever in his judgment the conditions of business shall make it desirable for him to do so, and to assign work requiring a superior or special kind of skill to those employees who possess the requisite skill. In any of these events the employee shall have the right to review of the action of the employer in the manner hereinafter provided.

11. (A) All members of the association shall register with the association, and the association shall register with the union, the names and addresses of all outside shops to which they send work.

(B) The association agrees that its members will not send their work, cut or uncut, to outside shops where the standards as herein fixed do not prevail. In case of a dispute between the employer and the union officials as to whether or not the standards herein fixed are maintained in the outside shops where his work is sent, the matter shall be left to the adjustment committee. If the adjustment committee shall decide that the standards have not been maintained, the work shall at once be withdrawn from such shops.

12. No security deposits shall be exacted from the employees, except for machine parts, which deposits shall not exceed \$1. and shall be refunded to the employee upon the surrender of said parts. Any other security deposits heretofore exacted shall be returned. No charge shall be made for electric power or for requisites of work.

13. No employee shall be allowed to hire and pay a helper, or helpers, but joint arrangements between the workers are not hereby prohibited, provided that the basis of division of earnings be fixed in advance, and that each of the employees taking part in such arrangement be paid his or her share directly by the employer.

14. No employee shall be required to work on orders placed by firms or shopkeepers whose employees are on strike, and the strike is indorsed by the International Ladies' Garment Workers' Union. The employer shall sell no goods to such firms.

15. The parties hereto agree to establish an adjustment committee, which shall consist of the chief clerk of the association, the chief clerk of the union and an umpire, who is to be selected forthwith by the parties hereto. Whatever compensation may be found proper for the umpire shall be paid jointly by the two organizations. The umpire shall be removed on complaint on either side, and in the event of the failure to agree upon a new umpire within ten days, the umpire shall be selected by the board of arbitration hereinafter provided.

16. Any complaint, either by employer or employee, shall be taken up for adjustment by the shop chairman and the employer, or some person designated by the latter. If they fail to agree, the matter shall at once be submitted for adjustment to the chief clerks of the association and the union. Should the chief clerks fail to agree, the complaint shall immediately be submitted to and adjusted within 48 hours by the chairman of the adjustment committee, whose decision is to be final and binding upon both sides. There shall be no stoppage of work pending such decisions.

17. Employees who have been discharged and have been ordered reinstated by the adjustment committee shall have the question of pay for the time they lost by reason of such discharge decided by said adjustment committee.

18. A permanent board of arbitrators, consisting of three members, one appointed by the association, one by the union, and one by the two parties jointly, the last to represent the general public, shall be promptly selected, to whom an appeal may be taken from the decision of the adjustment committee in all cases where either of the parties believes the matter to be of general importance to the trade. The board of arbitrators shall also have authority to determine all questions arising as to the construction of this agreement. Said board of arbitration shall be subject to be convened at the instance of either party on any matter not touched upon in this agreement, and on any question arising in the future between the association and the union.

19. The findings and determination of the adjustment committee, if not appealed from within five days, and the findings and determination of the board of arbitration, shall be binding upon both parties.

20. During the period of this agreement there shall be for no reason whatsoever any shop strike or general strike, and no individual or general lockout, but all complaints of either party must be adjusted in the manner as herein provided.

21. This agreement shall be in force until July 1, 1919. It is hereby agreed that if at the end of the first year any question on either side should arise that requires adjustment, the same shall be submitted to the board of arbitration for adjudication.

In witness whereof the parties hereto have signed this agreement through their respective officers, duly authorized thereto, the day and year first above written.

The agreement provides for a 49-hour week, restricts greatly overtime work, specifies minimum weekly and hourly rates of wages, defines the methods to be pursued in the determination of piece rates, outlaws strikes and lockouts, and creates elaborate agencies for the peaceful adjustment of grievances. It also introduces the principle of equal distribution of work during dull seasons. In addition to the above it accords to members of the union preference in employment and layoffs. Subcontracting of any kind is expressly prohibited. The agreement legalizes outside contracting, provided the labor standards of the outside or contract shops are as fixed in the agreement for the members of the association.

The agreement has now been in operation over four months. It is reported to have worked satisfactorily, considering the present abnormal condition of the cloak and suit industry.¹ All the grievances which have arisen have been peaceably adjusted through the

¹ Cloak and suit manufacturers of Philadelphia complain bitterly of the fact that their trade has rapidly been losing ground since the prolonged strike of 1913. The buyers which were then lost have never returned. Aside from the prolonged strike of 1913, the loss in trade is attributed to the fact that the Pennsylvania Railroad has removed its principal station for trains coming from the West from Broad Street, which is in the heart of the cloak industry, to North Philadelphia, 7 miles away. This change makes it very inconvenient for western buyers going to New York to stop over in Philadelphia to inspect merchandise.

offices of the employers' associations and the union without any recourse to the assistance of a third or outside party.

Collective bargaining in the cloak industry of Philadelphia is not confined to establishments belonging to members of the Women's Garment Manufacturers' Association. In addition to the agreement with the latter association, the union has over 50 agreements with individual establishments on terms very similar to those of the agreement with the employers' association discussed in detail above. The total employees of these 50 establishments is about 1,500.

DRESS AND WAIST INDUSTRY.¹

The beginning of collective bargaining on a significant scale in the dress and waist industry of Philadelphia dates back to a short general strike which took place in February, 1910. Although resulting in a trade agreement, this strike did not bring about successful collective bargaining.

The settlement of 1910 was effected by a board of arbitration agreed to by both sides. It was then agreed that all of the striking employees were to be taken back without discrimination. Upon return to work the employees of each shop were to select from among themselves a committee of three for the purpose of conferring with the employer regarding wages and hours.

The individual shop committees were to work upon the following basis, which was fixed in advance by the board of arbitration: (1) No charges to be made for power or needles; (2) 52½-hour week; (3) unless especially agreed to by the employees, no work was to be permitted on Saturdays after 1 o'clock; (4) piece rates as well as all other differences were to be settled by a committee representing the employees and the employer. In case of inability to agree, the controversy was to be referred to a committee of two, consisting of a representative of the manufacturers' association and a representative of the union. Disputes as to which the latter two could not agree were to be referred for final adjudication to the board of arbitration. The agreement was to continue in force until May 1, 1911.

As already stated, this agreement did not bring about real collective bargaining. It gradually went out of existence, as neither of the parties, apparently, was sufficiently well organized to bargain successfully.

Beginning December 15, 1915, after a threatened general strike, conferences were held for the purpose of formulating a new agreement. These conferences resulted in the signing of an agreement on

¹ Unlike the dress and waist industry of New York City, which is highly specialized, the dress and waist industry of Philadelphia includes also the production of children's and misses' dresses, silk dresses, and house dresses.

January 19, 1916. The agreement is between the Dress and Waist Manufacturers' Association of Philadelphia and the International Ladies' Garment Workers' Union, representing the dress and waist makers who are organized as its local number 15. It is in operation at the present time and governs the relations of the 135 members of the employers' association, with a total of about 6,000 employees.

The present agreement came about by a decision of a board of arbitration organized by mutual consent of both parties. The three principal demands of the union which were submitted to the board for final adjudication were:

1. The establishment of a minimum scale of wages for all cutters in the industry, as follows: (a) Full-fledged cutters who are required to do pattern grading, \$27.50 per week; (b) full-fledged cutters—those who work at laying, marking, and cutting but do no pattern grading—\$25 per week; (c) senior assistants—those with two years' experience, but not in the grade of full-fledged cutters—\$18 per week; (d) junior assistants—cutters in their second year—\$12 per week.

2. Week workers other than those mentioned to receive increases in wages as follows: (a) Such as have received no increase since January 20, 1916, \$2 per week; (b) such as have received an increase of \$1 or more since January 20, 1916, \$1 per week.

3. An increase of 15 per cent on all piece rates.

The first and second requests were denied by the board because it "was not in possession of sufficiently accurate information upon which to base a finding as to the reasonableness or unreasonableness of the requests." In this connection the board advised the creation of a wage board to investigate existing wage rates in the trade. This board was instructed to determine rates of wages for each of the occupations and to submit the findings to the board of arbitration for approval not later than September 1, 1917. To afford immediate relief to the workers the board of arbitration awarded a 10 per cent increase to all week workers, with the proviso that in no instance shall this increase be less than \$1 per week.

The third request was also denied by the board, because it was of the opinion "that the remedy lies in the hands of the pieceworkers, who, under the provisions of a previous decision of the board dealing with the creation of price committees and official adjusters, were empowered to settle any differences which might arise regarding piece prices." The board suggested that in the making of piece rates "all concerned should take into consideration the present high cost of living."

Unlike the majority of the trade agreements in existence at the present time in many of the other needle trades, the greater part

of this agreement is based upon understandings between the parties, seldom committed to writing. The written part of the agreement relates wholly to demands upon the disposition of which the parties themselves could not agree and which therefore had to be made by the board of arbitration. The findings of the latter are, as a rule, in writing.

The present agreement, as it actually stands, contains the following features: (1) Prohibition of strikes and lockouts; (2) agencies for the peaceable adjustment of grievances; (3) minimum weekly rates of wages for week and piece workers; (4) definite union recognition.

It is understood that the employees will refrain from striking, and that employers will not lock out their employees. All grievances arising are to be adjusted, in the first instance, by the shop chairman, who is the officially elected representative of the workers on the premises, and the employer, and, if these two can not agree, by a committee of two consisting of one representative of the union and one of the employers' association. Cases upon the disposition of which the latter two can not agree are to be submitted for final adjustment to the board of arbitration.

The agreement as originally signed in 1916 provided for specific rates of wages and weekly hours of labor and for a board of arbitration to adjust any differences which might arise. No special recognition or privileges were to be accorded to members of the union, the employers retaining their right to hire and fire at pleasure. As a matter of fact, however, the great majority of association establishments are at the present time completely unionized—that is, employ none but members of the union. This condition came about in the following manner: On August 21, 1916, the union presented certain demands to the employers, among which were: (1) The election by employees of each establishment of a chairman to represent them and their organization; (2) nonacceptance into the manufacturers' association of applicants without an investigation as to whether or not the applicant maintains agreement conditions in his shop; (3) delinquent union members in employ of members of the association to be compelled by their employers to keep in good standing with their organization.

The first two demands were immediately granted. At a subsequent joint conference, held September 7, 1916, the third was acceded to. The association passed a resolution to the effect that any of its members who fail to comply with the new obligation are to be subject to discipline upon reports received from the union. The new obligation virtually means that employers are to discharge union employees who fail to pay their dues, and that any employee having once joined the union must remain in it in order to hold his or her position.

The agreement is reported to have worked satisfactorily until war work appeared in the industry. This began about August, 1917, and has gradually extended until at the present time as many as one-half of the dress and waist makers of the city are employed on war work.

With the appearance of war work the number of shop stoppages increased greatly. The following appear to be the two principal reasons for the more frequent stoppages: (1) Some employers are inclined to deal arbitrarily with their employees because they work on "Government orders." Such employers usually claim that the jurisdiction of the union does not extend to war work, and, "even if it did, it is illegal for the workers to strike." Such assertions on the part of employers immediately result in stoppages to enforce demands for union recognition; (2) Many of the workers are socialists and pacifists, strike the more readily, because by striking they think they can help themselves, harm the "capitalist class," and hinder the carrying on of the war.

Collective bargaining in this industry is not confined to establishments owned or controlled by members of the Dress and Waist Manufacturers' Association. In addition to the agreement with the latter, the union has at the present time individual establishment agreements with about 40 employers, with terms very similar to those of the agreement with the manufacturers' association. These establishments employ about one thousand workers.

FIFTH ANNUAL REPORT OF THE SECRETARY OF LABOR.¹

While the general policies of the Department of Labor have continued to be the same, the Secretary of Labor states in his fifth annual report, the war has brought new and perplexing problems. It continues to be the purpose of the department to promote the welfare of wage earners and to advance their opportunities for employment; it aims to represent the interests of both organized and unorganized labor; and strives to do so in harmony with the welfare of all industrial classes so as to secure the largest measure of industrial justice.

The war has strained the relations between employers and employees; yet it is true that "in diminishing numbers and with lessening influence as war conditions have developed" employers have opposed the right of wage earners to organize. The Secretary characterizes as unpatriotic the attempt to obstruct arbitrarily labor organization of the conservative as distinguished from the revolutionary type. Making the joining of a labor organization a cause for dismissal from employment—because it is really designed to prevent organization—tends to remove the workers from "the pacifying influences of constructive and responsible labor organization" and to bring them under the influence of the revolutionary type of organization. The Secretary deprecates this fact, declaring that—

It is the policy of this department to acknowledge the right of both employers and wage earners to organize, but to use its influence against abuse of organization on either side. This policy has been justified by the experience of the mediation service of the department, described in earlier pages of this report. Whenever employers enter into negotiations with organized workers, differences are almost always adjusted satisfactorily. Although both sides have at times made demands which, in view of the war, are unreasonable, nevertheless reasonable settlements have been made when both have come together in a patriotic spirit. In justice it should be added that since the war began the department has encountered not more than one or two instances in which a fair adjustment of differences has been prevented by any representative of organized labor.

All proposals, the Secretary continues, to settle labor disputes by coercing wage earners are "both unfair and impracticable;" "they are also widely regarded, and not without reason, as unpatriotic." These remarks refer particularly to proposals for the conscription of industrial labor. A one-sided policy of "conscription of labor

¹ Fifth annual report of the Secretary of Labor, fiscal year ending June 30, 1917. Washington, 1917. 159 pp.

for private profit" public sentiment can not be expected to tolerate; such a policy must be accompanied by the correlative one of conscription of industry, "so as to make such workers not coerced servants of employers, but employees of the Government itself."

There is, however, no reason for apprehending a necessity for labor conscription, the report continues, in order to settle disputes which interfere with a rigorous prosecution of the war:

By simple and fair systems of collective bargaining between the Government, labor organizations and business organizations, all labor disputes prejudicial to an effective prosecution of the war can be promptly eliminated from war problems.

SETTLEMENT OF LABOR DISPUTES.

The field of the Department of Labor in the settlement of labor disputes includes all lines of industry wherever its services may be requested or be considered of value. It does not take jurisdiction of disputes in transportation lines, except those occurring among clerks, shopmen, and others not directly engaged therein.

The work of the department has greatly expanded since the entry of the United States into the war and the importance of it is thus emphasized by the Secretary:

The anxiety of the Government, particularly at this time, for a full production from mine, mill, and factory in order that the war progress of the United States and our allies might be unhampered caused the commissioners of conciliation to strain every effort to secure satisfactory adjustments in all labor controversies, with the special purpose of preventing, wherever possible, any stoppage of work and consequent loss to the country in output and to the workers in wages. Vastly increased production has been thus facilitated.

The success which has attended the department's representatives in the great majority of disputes has been most gratifying. In many instances, through the efforts of the department, strikes which would have involved thousands of workers engaged in great operations were quietly averted and industrial peace maintained.

The magnitude of the labor disputes handled during the fiscal year ending June 30, 1917, is indicated by the fact that 473,734 workmen were directly affected and 334,225 indirectly. Increased work since the war declaration of April 6, 1917, is shown by the fact that since the end of the fiscal year to October 25, 1917, the additional number of disputes involved directly almost three-fourths (343,906) as many workmen as were affected during the whole of the fiscal year. The disputes of this latter period involved indirectly 202,578 workmen, or about two-thirds of those indirectly affected by disputes occurring during the whole fiscal year. And of the disputes arising during the fiscal year those occurring during that part of the war period from April 6 to June 30, 1917, affected directly 228,123 workmen, and indirectly 178,376.

The character of the disputes handled by the department from July 1, 1916, to October 25, 1917, is indicated in the statement below:

NATURE OF DISPUTES HANDLED BY DEPARTMENT OF LABOR, JULY 1, 1916, TO OCT. 25, 1917.

Period covered.	Nature of disputes.			
	Strikes.	Lockouts.	Controversies.	Total.
Apr. 6, 1917, to Oct. 25, 1917.....	281	28	212	521
July 1, 1916, to June 30, 1917.....	242	13	123	378

Of 378 disputes during the fiscal year under review the department successfully adjusted 248, or 65.6 per cent. It was unable to adjust 47, or 12.4 per cent: while 42, or 11.1 per cent, were pending: and in 41 cases, or 10.8 per cent, the result is not specified.

RESULTS OF EFFORTS AT MEDIATION BY THE CONCILIATORS OF THE DEPARTMENT OF LABOR, JULY 1, 1916, TO OCT. 25, 1917.

The success of the department's work is looked upon as most gratifying, and attention is called to the growing desire on the part of both employers and employees to secure the good offices of the department.

Labor has discovered that it has a standing in the Government machinery of its country whenever its demands are based on its industrial and constitutional rights. Employers, on the other hand, have found the department a defender against unreasonable exaction.

FEDERAL EMPLOYMENT SERVICE.

To such magnitude has the employment service of the Division of Information, which is a part of the Bureau of Immigration, grown as a result of the war demands that the Secretary urges the creation of a national employment bureau or independent division in the department. A bill is recommended for enactment which provides for a Commissioner of Employment at \$5,000 per annum, to be appointed by the Secretary.

The war brought an extraordinary demand for "man power," particularly in all industries supplying war materials. "Much of this,"

the Secretary of Labor says, "was found to have been influenced more by eagerness for labor at low or inadequate wages relatively to the sharp rise in living expenses than by general labor shortage." The problem to be met by the department was less a problem of labor scarcity than of imperfect distribution.

Perhaps the largest service of the department was rendered in connection with recruiting men for the construction work of the Shipping Board. Within 10 days of the call from the board a list of approximately 19,000 skilled mechanics ready for service was secured by the department. Calls for labor in the construction of the Army cantonments have also been responded to by the department.

In furtherance of its war employment service the department created, on June 14, 1917, the United States Public Service Reserve. This is a registration agency for patriotic citizens who desire to offer their services either with or without compensation to the Government or to enterprises engaged on Government work.

The Boys' Working Reserve was organized April 20, 1917, for registration of boys over 16 years of age who may wish to do service in employments depleted of adult workers by war necessities. The organization, which is much decentralized and dependent upon the personal initiative and abilities of the State directors cooperating with the central director at the department, has placed over 150,000 boys upon farms for seasonal work—"boys from city life who otherwise would not have been able to render this national service."

A service similar to those above has also been established for the benefit of woman workers.

To assist the department in its employment service for the current year an emergency appropriation of \$250,000 (\$750,000 asked) was granted by Congress October 6, 1917.

The extent of the work of this Federal employment service may be seen from the subjoined table for the years in which it has been in operation. The extraordinary increase for the fiscal year 1917 is quite apparent.

WORK OF THE DIVISION OF INFORMATION, BUREAU OF IMMIGRATION, OF THE DEPARTMENT OF LABOR, FOR THE FISCAL YEARS 1908 TO 1917.

Fiscal year.	Applica- tions for work.	Number referred to em- ployment.	Number actually employed.	Fiscal year.	Applica- tions for work.	Number referred to em- ployment.	Number actually employed.

¹ For months of May and June only.

IMMIGRATION.

The administration of the immigration and Chinese exclusion acts rests with the Department of Labor exclusively. During the fiscal year 362,877 aliens were admitted to the United States and 16,028 excluded. Of this number 295,403 were immigrant aliens and 67,474 nonimmigrant. The number of immigrant aliens admitted during the fiscal year 1916 was 298,826, making an immigrant decrease of 3,423. Subtracting the number of alien departures, the net increase in alien population in 1917 has been 216,498.

THE CHILD-LABOR LAW.

While the Department of Labor is primarily engaged in the enforcement of the Federal child labor act, the Departments of Justice and Commerce cooperate also in its enforcement. The immediate enforcement of the law is delegated to the Child Labor Division of the Children's Bureau in the Department of Labor. As the law became effective January 4, 1917, the principal work in its enforcement during the year has consisted in the formulation of regulations for carrying out its provisions. In the issue of certificates of age, particularly, close cooperation has been established with State officials engaged in enforcing the child labor laws of those States.

As the result of its study on the child-labor situation in connection with the law, the bureau called the attention of the Secretary of War to the employment of children on a Government reservation. The Secretary of War subsequently issued regulations concerning the future employment of children on such reservations, regulations which conform to the standards laid down in the child-labor act itself.

Aside from the administration of the child-labor law the principal work of the Children's Bureau is investigative. Special studies of child welfare abroad have been made by the bureau. These include matters of child labor, dependency, delinquency, illegitimacy, provisions for soldiers' families, maternal and infant care.

The bureau has combined the results of its eight completed field studies on infant mortality and finds "an even steadier decrease in the death rate among babies under one year of age as the income of the father increases" than did the figures for the Manchester (N. H.) study published during the year.

WOMAN LABOR.

The war early emphasized the importance of woman labor for the war industries. A central employing agency, created by private enterprises at first, was turned over to the Department of Labor just before our declaration of war. The work has consisted of (1)

the assortment and collation of data on war contracts involving woman labor; (2) sending contracts exclusively to agents of the United States Employment Service; (3) collection of information as to requests for woman labor in war industries; (4) determination of the legitimacy of such requests; (5) exclusive initiation in recruiting the labor of women. Cooperation, however, is invited from State, municipal, and private agencies.

FARM LABOR.

The Department of Agriculture assumed the task of studying the supplies and needs of farm labor in rural districts, while the Department of Labor cooperated to study the available supplies in towns and cities and to direct these through their employment agencies to places of need. The Department of Labor continued to maintain Kansas City as its center of harvest land operations, and kept in close touch with the National Farm Labor Exchange. The department extended its activities by aiding in placing men for the Canadian harvests.

Closely related to the farm labor shortage is the recommendation of the Secretary of Labor for the creation of agricultural colonies and Government lands under governmental supervision. These colonies are designed to attract labor from urban centers, young farmers just getting a start and others interested. The colonists should be given some limited form of title, "without investing them with absolute tenure rights, useless to them but attractive to speculators." A system of cooperative credits is suggested. For the purpose in question a measure similar to the Crosser colonization bill now pending "seems well adapted in principle and easily adaptable in terms."

NEGRO LABOR.

"With the coming on of war, a stream of negro migration from the South," the Secretary of Labor notes, "caused much concern with reference to planting, and harvesting the crops of that region." Inducements were held out in the North principally by railroad corporations desiring to make up for the loss of unskilled immigrant labor. Group migration, at first assisted by the department, was abandoned on the discovery of these circumstances, but assistance in finding employment was continued for individuals, regardless of race.

The department has under way an investigation of the causes and conditions surrounding this migration because it considers the problem an important one, characterizing it as "an acute labor phase of the war problem."

Preliminary reports from those in charge of the investigation in the South show "that on its economic side there necessarily must be some increase of wages, and on farms and plantations, better understanding and accounting between landlord and tenant, better housing and gardening, and more intelligent adjustment to crop rotation, and to necessary changes in methods of agriculture," in order to prevent a further labor shortage in the South.

CIVIL AND MILITARY SERVICE.

The department cooperated with the Civil Service Commission in employment work, assisting in finding men for the navy yards, arsenals, and other Government establishments; the officers of the department in some districts sit with the examining board of the commission or carry out the work where the commission has no representatives.

The work that the department can do at the close of this war is forecast in its efforts in the placing of national guardsmen after their return from the Mexican border. The department estimates that it placed 15,577 guardsmen in employment out of a total of 50,000 who returned from the border during February and March of 1917.

For the general civil service the Secretary renews his recommendation of the previous year for an equitable system of retirement, "one that will best subserve the interests of efficiency and economy and at the same time insure fair financial provision for the old age of Government employees who by long and faithful service have deserved this consideration."

BUREAU OF LABOR STATISTICS.

The Bureau of Labor Statistics, together with the Children's Bureau, are the investigative branches of the department. The investigations of the latter have been adverted to already. Special studies with reference to the war have been undertaken by the Bureau of Labor Statistics: these have included wage and price studies in communities affected by the expansion in industry, types of collective bargaining, industrial hazards from accident and disease, and the employment of women in men's occupations. The bureau has also published bulletins and articles of British, French, and other foreign official reports, on hours, fatigue, health, welfare work, the employment of women and juveniles, labor unrest, and other matters concerning conditions of labor in those countries.

COORDINATION OF DEPARTMENTAL FUNCTIONS.

In a communication which was submitted to the Speaker of the House on January 9, 1917, and which the Secretary incorporates at

length in his annual report, attention is called to the fact that certain bureaus in other departments of the Government are engaged in work properly belonging in the Department of Labor. The field of the Public Health Service, for instance, overlaps that of the Bureau of Labor Statistics in the investigation of occupational diseases; the employment work of the Bureau of Navigation in the Department of Commerce—hiring and discharging of seamen—is logically within the purview of the Department of Labor; and the licensing of officers of vessels and the administration of the safety laws applying to vessels and their crews—now functions of the Department of Commerce (Steamboat-Inspection Service)—so far as this latter function relates to the personnel of the vessel, belong, naturally, to the Department of Labor. To avoid this duplication of effort legislation is needed, and the passage of such a measure is earnestly recommended.

LABOR AND THE WAR.

THE SOLDIER, THE WORKER, AND THE LAND'S RESOURCES.¹

BY BENTON MACKAYE.

The United States to-day, in common with the other belligerent nations, has before it the question of providing for the returning soldier and for the worker who has been dislocated in his occupation by the war. The dislocated must be relocated. For those who are going to be able to use it, land will be, as always, the fundamental opportunity. The other belligerent nations, notably Great Britain and her colonies, are making extensive plans for public colonization. Our neighbor Canada is working on Crown-land legislation which is perhaps more advanced even than that of Australia, and the actual location of returning soldiers has begun on lands in Ontario and in Manitoba.

This same problem was before this country 50 years ago. The question then was, How can the public domain be utilized for the benefit of the Civil War soldier? The so-called solution was to pass a law providing for soldier's additional homestead land. By the terms of the homestead law, passed in 1862, any citizen of the United States could obtain free of charge 160 acres of public land after residing thereon for five years and making certain improvements. But under the soldier's additional law, passed in 1872, any Civil War veteran who had already obtained a homestead of less than 160 acres could get, without the need of residence or improvement, the additional land needed to make 160 acres. Every such veteran could get a paper certificate whereby the acreage to which he was entitled could be secured. This certificate became known as scrip, which was a document enabling the holder to select and obtain from the Government the immediate and unconditional title to a given acreage anywhere upon the public domain. Since this form of scrip amounted to a free and transferable ticket to a piece of public land at no definite location it became subject to grave abuses by land and town-site speculators.

It does not seem probable that the device of soldier's scrip will be tried again. It belongs with the old order of land legislation which

¹ This article is a summary of a forthcoming report on the subject of land colonization.

resulted in the disintegration of most of the public domain. Since Civil War days, however, a new order has come about.

A NEW ORDER IN GOVERNMENT LAND POLICY.

Disintegration is gradually being replaced by integration of the Nation's sources of life. The establishment since 1891 of over 130 million acres of National Forest land in the West is one prime move in the new process of national integration. The purchase by the Government since 1911 of nearly 1,000,000 acres of forest lands in the Appalachian and White Mountains of the East is a sharp reversal of the former policy of public land disposal. And again the leasing system established in 1914 for coal lands in Alaska, together with the reservation of a portion thereof for Government purposes, extends to another great resource, the application of the conservation policy adopted for the remaining forest resources.

The growing policy of integration, moreover, shows itself in other ways than in the retention and the acquisition of public resources. In the development of resources, the Government has become active where it used to be passive. The reclamation law, passed 15 years ago, marks the new policy as it applies to the vast areas of desert lands in the West. The Alaskan railroad, begun in 1914, is second to the Panama Canal in the Government's major transportation projects. The proposal to conduct timber operations by the Government in getting out spruce for airplanes contemplates extending still further the field of public action.

And with the birth five years ago of the Department of Labor, the workers' point of view has been definitely brought into play with regard to the Government's part in the country's development. From whatever other angle they may be viewed, the land and resources of the country are to-day looked upon by the Government as an opportunity for the Nation's workers. This policy was rendered strikingly articulate by the present Secretary of Labor in 1915, when he said, in his annual report for that year, that "the labor-distribution work of this department should extend to some such development of the natural resources of this country as will tend to make opportunities for workers greater than demands for work."

In view, then, of present public policies in land development, the problem that now faces the country of relocating the soldier and worker requires a substitute for the old method of soldier's scrip. And it is the peculiar province of the Department of Labor to make tangible suggestions as to this substitute. Accordingly this department will soon publish a preliminary report on this subject based on the investigation referred to in the footnote at the beginning of this article.

A HUNDRED MILLION ACRES OF IDLE AGRICULTURAL LANDS.

This investigation shows that the idle lands in the United States—cut-over lands, swamp lands, and arid lands—capable of reclamation through stump clearing, drainage, and irrigation, cover approximately 100,000,000 acres. The cut-over or logged-off lands are located for the most part in the big valleys of the forested sections of the Pacific Northwest and the Rocky Mountain region, in the northern Lake States (Minnesota, Wisconsin, and upper Michigan), and in the southern coastal region from Virginia to Texas. The undeveloped swamp lands lie chiefly in Florida, in the Mississippi delta, along the Atlantic and Gulf coasts, and in northern Minnesota. The remaining arid but irrigable lands lie mostly in the valleys of the Colorado Basin and elsewhere through the western States.

Large areas of the arid lands are still in the public domain; large portions of the swamp lands in Florida and in Minnesota are still in State ownership; but by far the greater portion of the logged-off land is under private ownership: The present methods of developing these lands are inefficient with respect alike to the settler, the bona-fide investor, and the Nation at large. Especially is this so as regards the logged-off lands.

In spite of the good progress which has been made, from a mechanical standpoint, in devising means for pulling and piling stumps, the financial management, taken as a whole, of stump-land development is such as to deprive the settler with small means of taking advantage of any efficient methods of land clearing. The average settler by means of very severe work makes an existence, but little more. Many of them give up the combined fight against nature and finance and return to the shops and the mines, where their wage, however small, is at least a known quantity. The handling of lands is on a semigambling basis. There may be a huge profit derived by the landowner or selling agent, or there may be a loss. Often the agents and subagents obtain the lion's share of whatever money is to be made. At the present rate of clearing it will take more than a century to reclaim the country's logged-off lands.

TIMBER CULTURE VERSUS "TIMBER MINING."

There are in the United States about 450,000,000 acres which are more suitable for growing wood and timber than for any other purposes. Of this area 150,000,000 acres occur in the mountain regions of the far west; the remaining acreage occurs in the mountainous and other portions of the eastern States. Most of the eastern forests have been cut over and more or less depleted, while large parts of the western forests yet remain in virgin condition. Almost all of the eastern forests are in private ownership, whereas two-thirds of the

western forest area is owned by the Government in national forests. The seat of the lumber industry has been moving across the continent during the last 75 years. In 1850 and up to 1870 the largest proportion of the Nation's cut of timber came from the northeastern States; by 1890 the main share was coming from the Lake States; to-day it is coming from the Gulf States; and in the near future the final seat of the industry as now conducted will be in the Pacific Northwest.

The lumbering process which is thus passing in a series of waves over the country has had but one chief object—to shovel out the timber. Timber culture on any appreciable scale has not been practiced. The industry is one of "timber mining." One valley after another has been cut off and left empty—one region after another has been largely depleted of its forest stock. Only a small portion of the young stock which should be growing, is actually coming up. The effect of this condition on the future supply of wood is obvious, and has been many times pointed out. Its effect upon social and labor conditions is equally demoralizing. The "timber-mining" industry is essentially migratory, hence employment therein is essentially unstable. The lumber jack must live in a camp, and the man with a family is excluded as a worker. "Timber mining" being itself a tramp industry, it is a breeder of tramps; it is an industry of homeless men.

According to estimates made by the California Commission of Immigration and Housing there were in 1915 living in the labor camps of that State 75,000 persons exclusive of farm laborers. On this basis the Bureau of Labor Statistics estimates that there are at least 100,000 workers in the various kinds of labor camps—logging, mining, and other camps—in the three Pacific States alone.¹

Under present methods of handling, the undeveloped resources of this country—agricultural, forest, or other resources—offer to the returning soldier or worker no opportunity of real value to him. Under proper methods of management, however, these resources offer vast opportunities. Leaving out the possibilities under proper management of permanent employment on forest lands, leaving out the opportunities on semiwild grazing lands, and leaving out the whole of Alaska, the population which can be cared for on the hundred million acres of logged-off, swamp, and arid lands is greater than that of New England.

What can be done to develop these potential opportunities into actualities? A few suggestions, in line with present day Government policies, are made in the following paragraphs as to the course of this development.

¹ Labor laws and their administration in the Pacific States, by Hugh S. Hanna. Bul. 211, U. S. Bureau of Labor Statistics, p. 15.

A POSSIBLE POLICY FOR AGRICULTURAL LANDS.

In the first place no sweeping rule can be laid down for arriving at proper methods of managing our natural resources except to say that the utmost friendly cooperation is required between the Federal Government, the States, the landowners, and the labor interests involved. The problem of land management is too complex, both from physical and legal standpoints, to be subject to universal rules.

The most promising field perhaps for the right kind of colonization of wild lands exists in the mountainous regions of the Northwestern States. The natural unit of development here, from a physical standpoint, is the mountain basin. Usually the level meadow land in the bottom valleys is chiefly valuable for farming, while the slopes, more or less forested, are chiefly valuable for growing timber. A certain amount of grazing land occurs among the timbered areas. Most of the area on the mountain slopes is now Government land in national forests, while nearly all of the bottom land has been cut up into private holdings. Part of this bottom land, in the localities of the national forests, has been developed for farming, but large areas yet remain under timber or in stumps.

Even on the bottom lands all of the area is by no means most suitable for farming. The soil itself may not be fertile or the cost of stump disposal may be prohibitive. No land should be used for farming of which the average yearly return will not be at least sufficient to pay, in addition to reclamation costs, a normal wage for normal labor. But land not adapted to profitable farming is usually suitable for growing timber. It is estimated that only 4 per cent of national forest land will ever be suitable for farming.

With areas found by the above test to be potential agricultural land, the Federal Government might offer to the respective States and landowners involved, its services for reclamation. Improvement districts could be established covering definite portions of certain valleys. Within each district the Government could, by contract or otherwise, conduct large-scale stump-pulling operations, the cost of which could be charged against the land cleared. Through the use of Government credit the interest could be kept very low and the clearing charges extended, on the amortization plan, over many years. The Government could also, through its Employment Service, provide for locating settlers upon the land reclaimed.

But the Government should not offer to aid in these ways until the State and the landowners involved make provision in specific ways that land speculation shall be eliminated from the district to be improved, and that the settlers therein shall be charged in such manner for the use of land as to insure them normal wages and security in their homes.

In this way the Government would reclaim and colonize the land for the owners, provided only that the settler when he arrives, and at all times, gets in specific ways a square deal. The settler, whether returned soldier or other worker, needs something beside mere acreage in order to make a decent living. The old method of turning over to the homesteader 160 acres in the wilderness, and then leaving him, as if he were Robinson Crusoe, to work out his fate single handed, belongs, for the most part, to the past. It is a policy to be put upon the scrap heap along with the policy of soldier's scrip, of which it is a part.

The prospective farm could be cleared of stumps or other impediment; it could be equipped with house and barn; it could be made accessible to market by good roads. The settler himself should have every chance to cooperate with his neighbors in selling his produce and in buying his supplies. The farms could be made ready for immediate use, and the cooperative equipment prepared in advance. Men can not live by land alone except by returning to a form of savagery. If the agricultural worker deserves an even chance with the manufacturing worker, then the farm as well as the factory must be fully equipped before, not after, operations begin.

The policy here outlined applies to more than the logged-off lands of the western mountain valleys. Townships and tracts of land can be organized into improvement districts in other parts of the country. The cut-over lands in the northern Lake States, in the southern Atlantic and in the Gulf States, can be reclaimed from stumps and left-over timber under the same policy. The swamp lands in these same regions can likewise be reclaimed, as well as the remaining arid lands of the West. In all these regions there are vast values to be created. The Government can well follow up its present reclamation policies by taking the initiative in creating these values. In so doing, however, clean-cut measures must be taken to see that values thus made go where they belong: to the settler and worker in the equivalent of fair wages, to the legitimate investor in a fair return, to the local community in sufficient taxes, but not to the speculator in unearned profits.

A POSSIBLE POLICY FOR FOREST LANDS.

But undeveloped land in the United States offers to the returning soldier and the worker an opportunity in other ways than for agricultural use. Under proper management it offers an opportunity for permanent employment in the forest industry. From a physical standpoint there is no reason whatsoever why the forested valleys and slopes of the western mountains, where the principal future supply of timber now remains, can not be handled so as

to insure within each locality a continuous yield of timber, and continuous employment in the sawmill and woods. Many localities within the national forests offer such opportunities.

A typical drainage basin in the western national forests may be assumed to contain 100,000 acres of productive forest land. Suppose a series of operations are planned whereby the mature timber on this tract is to be cut off in 50 years. If the right methods of cutting are used, by the end of this 50-year period the younger trees will have grown so that the tract will be ready to be cut over again. In this way the tract can be kept continuously productive for all time. Suppose the permanent annual yield from this tract is 20,000,000 board feet. This yield would provide continuous employment for more than 150 men, who with their families would make a population of about 800. About half the men would be employed in the sawmill and half in the chopping operations. The sawmill located perhaps at the entrance of the valley would support a permanent community of about 400 people. The logging operations in the woods would support another permanent community of 400. This community would have to be relocated from time to time as different portions of the tract were being operated. But since the employment would be continuous the forest workers could at all times live in their homes with their families and maintain a community life.

Measures should be taken to see that the populations supported by the sawmill and the forest operations would develop into real communities and not mere shack towns. Aside from the maintenance of proper housing and living conditions, there are two or three fundamental community standards. These include provision for voting and self-government, for schools, churches, and educational facilities, and for cooperation among the workers to secure their economic and social welfare.

Permanent forest communities based upon continuous forest employment would make of the forest worker a family man instead of a hobo. Those determined to be hoboes would be eliminated, but those who wanted settled employment could have it. With such a system in vogue many of the labor difficulties in the lumber industry would be ended. And such difficulties can not be settled by model camps, for a camp, however model, is no substitute for home.

The system of forestry and continuous forest employment outlined above could readily be installed on certain of the national forests to provide for present and permanent needs of the Government for timber. Such operations could be carried on either by the Government directly or through the method of timber sales. The Government has been considering the advisability of taking part in timber operations in the Pacific Northwest, private corporations hav-

ing been unable to get Sitka spruce for Army airplane stock in the quantities required. In many cases, private holdings of timber land are included within national forest boundaries. These holdings might be purchased by the Government, though perhaps a more practicable method would be to adopt some cooperative arrangement with the owners whereby they would receive each year a part of the net returns from the whole operation, such part being in proportion to the amount of the timber owned by them as compared with the total amount of timber on the tract.

OPPORTUNITIES FOR WORKERS IN THE DEVELOPMENT OF COAL LANDS.

The natural resources of the United States offer still further opportunities for the returning soldier and the worker. There are many million acres of grazing lands throughout the western States which can be utilized for their benefit. There are also extensive areas of coal lands.

A big undeveloped coal field lies in the San Juan Valley, in northern New Mexico and southern Colorado. A proposition has already been before Congress to build a Government railroad to tap this region. But the most extensive coal fields yet undeveloped, within the jurisdiction of the United States, are in Alaska. The Matanuska coal lands in that Territory are to be opened under a leasing system, though a large portion of them is to be retained for exclusive Government utilization. In its handling of the operations in these coal fields the Government has a chance to set a standard for proper labor conditions in the mining industry.

The Government railroad in Alaska, in addition to tapping the Matanuska coal fields, will open up vast areas now inaccessible. It is estimated that Alaska contains, in its valleys which lie between the ice-covered mountains, about 65 million acres of potential agricultural land now covered by a meager growth of timber. The projected lines of Government railways are going to penetrate, in Alaska, the last American frontier. In view of the combination of mineral, forest, and agricultural resources to be opened in that vast country, nearly all of which is still public land, Alaska should present one of the most promising areas now left on the globe for those seeking a new start in life. Another Scandinavia here awaits development. The Government railroad is the first big step in this development. If this new country is to be an opportunity for the soldier and the worker, and not for the speculator, a colonization policy, based upon the principles discussed, must be the next step in its development.

The suggestions herein made, so far as they relate to the utilization of farming and forest lands, have been worked out in some detail in

the forthcoming report above referred to. But a substitute for the scrip method of relocating the soldier and worker, on the lines here suggested, will, of course, require legislation by Congress. A national colonization bill has already been introduced in the House by Representative Robert Crosser, of Ohio, and its principles have received the approval of the Secretary of Labor in his recent annual report. Under the provisions of this measure, with slight revision, the suggestions for policy above outlined could be applied.

The Department of Labor in pursuing the investigation here started desires to do its full part in developing a policy which will lead, rather than follow, the other countries of the world in their own advanced policies of utilizing land and resources for the benefit of the returning soldier and the worker. In this big task the fullest possible cooperation is solicited.

SOME CONSIDERATIONS AFFECTING THE REPLACEMENT OF MEN BY WOMEN WORKERS.¹

BY JOSEPHINE GOLDMARK, PUBLICATION SECRETARY, NATIONAL CONSUMERS' LEAGUE.

Among the many new and urgent problems of industry in war-time, none challenges our best thought more sharply than the replacement of men by women workers. This movement, which has gone far abroad, is still in its infancy in this country; yet it is not too soon, it is indeed high time, to gauge the tendencies and consequences of so radical a change. The replacement of men by women, proceeding in many industries and occupations in every State of the Union, must of necessity react for good or for ill not only upon the girls and women so employed, but upon far wider circles, upon their families, their children, and upon the whole standard of living of their communities.

In this country it is too soon as yet to hazard an estimate of the numbers of women who are entering upon new occupations and taking men's places. The number of the women so employed is not yet numerically great: their employment is in many cases still experimental, but we are undoubtedly on the threshold of great innovations. Girls and women as messengers and elevator operators, as section hands and towermen on railroads, running drills and presses, working in powdermills and sawmills, cleaning the outside of railroad coaches; and wiping engines in the machine shop, in the munitions plant, in the airplane factory—these are some of the new figures in industry.

¹ Read before the section on industrial hygiene of the American Public Health Association, Washington, D. C., Oct. 18, 1917.

BENEFITS OF THE CHANGE.

Among the benefits from the new widening of women's employment one of the most important is the breakdown of prejudices. Women have in the past been hampered in advancing industrially by the prejudices of both employers and their fellow workmen, organized and unorganized. Women's sex and inexperience have been made the excuse not only for all manner of exploitation, but for the refusal of employers to advance them to positions of responsibility and trust. One of the triumphs of women's war-time employment in England has been their response to opportunity—the intelligence and the speed with which they have reacted to instruction in intricate new work, such as the manufacture of aero engines and guns, as well as in the simpler operations of making shells, fuses, hand grenades, etc. This is the universal testimony—to the unbounded surprise of all, women have proved their ability to enter upon and succeed in work hitherto closed to them on the sole ground of their sex.

And this success has been a triumph not only for women workers but for the new methods of instruction in industry. Instead of the old rule of thumb and mere copying of fellow workmen by apprentices and new workers, there has been intelligent direction of the working women newly introduced into the workshops of England. Mr. Granville Baillie, of the British Ministry of Munitions, at a conference on women in industry in London last May, told how the new training had enabled working women to surprise the world by their achievements in industry by the speed, the accuracy, and the responsibility with which they have mastered their new trades. The training has been most successful when carried on in the plant where the women are to work. Under the British Ministry of Munitions, training schools were established with a view to giving untrained women some general technical instruction for the simpler processes in the engineering and chemical trades. This has been best carried out in the individual shop rather than in technical schools "which," says the Health of Munition Workers Committee, "however excellent, can no more replace factory instruction than can drilling in the park, training in the field.

Throughout the world women are entering these new fields. Between July, 1914, and January, 1917, the number of women gainfully employed in Great Britain had increased by almost one-third. According to the British Labor Gazette of August, 1917, 256,000 women are directly replacing men.¹ In Germany the number of women employed in metal trades alone in July, 1916, is reported to have been over 3,000,000. In France the Minister of Munitions

¹ MONTHLY REVIEW of the U. S. Bureau of Labor Statistics, October, 1917, p. 41.

stated just a year ago that 300,000 women had gone into munition works; from Italy it is officially reported that the number of women employed in munition works in Lombardy has risen from over 4 to about 10 per cent of the total number of employees.¹

Undoubtedly in this country many promising fields are opening for women from which they have been debarred and for which they are well fitted. Such are the new positions in many branches of the railroad service: for instance, as freight checkers, as ticket agents and information clerks, in weeding and clearing the tracks; in banks and financial houses: in cost and production departments: as floor-walkers in stores: as clerks in shoe stores, etc. In machine shops women are found to excel men in inspecting and testing and in other operations requiring dexterity. In many instances, too, women are now receiving far higher wages than ever before for work no harder than women's traditional exhausting labor of scrubbing floors during long hours in dampness and wet. Yet, granting all that promises from such gains, no one can view without alarm the indiscriminate employment of women which is in process or impending in such heavy work as glassmaking, in some of the processes of steel mills exposed to extreme heat, as ballast tampers or freight handlers on railroads, as pilers of lumber and loaders of scrap iron, or in the bleachery pits of cotton mills, to mention some of the occupations most needing scrutiny and care.

EVILS NEEDING SCRUTINY.

If the achievements of women workers challenge the world's admiration, we can not neglect the obverse side of the picture. We have not yet learned the cost, the wastage of woman power.² There is no doubt that both abroad and in this country unmistakable dangers are inherent in many of the new occupations. Some, indeed, are totally unfit for women: some may be rendered fit by changes in method of management: in all of them the indispensable prerequisite is a new scrutiny of the workers and the effect of the work, a kind of intelligent supervision known hitherto in only a very small number of the most enlightened establishments but needed now wherever women are employed in new lines of activity if we are to preserve our national energies.

LIFTING EXCESSIVE WEIGHTS.

Of the specific dangers to be guarded against one of the most obvious is the lifting of excessive weights. This has long been recog-

¹ Child Labor in Warring Countries: A brief review of foreign reports. The Children's Bureau, U. S. Department of Labor. Industrial Series No. 4, pp. 12, 13, 14.

² See Women's Industrial News. London. July, 1917.

nized as a source of injury for women. In no occupation hitherto engaged in have the chances of physical harm from lifting excessive weights been greater than, for instance, in the proposed employment of women in railroad freight yards. One road which has contemplated such a step stated that the weight of goods to be lifted would run up to 100 pounds. No argument is needed to show that such work, continued through the day, is unfit for women and should be totally prohibited. It is true that in laundries, another traditional employment of women, women are expected to lift bundles often weighing more than 100 pounds. This is undoubtedly a source of physical injury; in freight yards such burdens are not an occasional part of the work but constitute its main part. In one railroad yard girls themselves weighing not more than 115 pounds were found wheeling metal castings in wheelbarrows up and down inclined planks and loading them into the cars.

A recent report from Germany shows that among women employed in the metal trades heavy lifting is a main cause of physical injury. The inquiry covered over 2,500 establishments employing more than 266,000 women and girls, an increase of 319 per cent over the number employed before the war. Projectiles weighing from 22 pounds to 82 pounds have to be raised breast high from the floor and clamped down, then unclamped and placed again on the floor. According to this report, given in *Soziale Praxis* of April 19, 1916, there is great complaint of abdominal trouble among the women who raise these weights. In one establishment which required very hard muscular work it is reported that nearly a third of the 42 women employed "have been disabled by illness."¹

Clearly, in any occupation which requires heavy lifting—as, for instance, in core rooms—a maximum weight should be set. In New York State a maximum of 25 pounds has been fixed by law regulating women's work in foundries. This maximum was set in the "code" adopted by the American Foundrymen's Association at their annual convention last summer. A maximum of 25 pounds in lifting weights was adopted also in the valuable standards formulated by the Executives' Club of Detroit last spring, representing 40 of the largest industrial plants in that city.²

The establishment of a maximum weight in lifting is obviously a rough measure of protection. In all occupations safety lies only in the physical examination of all prospective workers, or better in the medical supervision of workers, as Dr. Schereschewsky has well phrased it in a recent address.³ For some women doubtless even 25

¹ MONTHLY REVIEW of the U. S. Bureau of Labor Statistics, September, 1917, p. 135.

² Industrial Management, August, 1917.

³ Public Health Reports. Reprint No. 234, Nov. 20, 1914.

pounds is excessive when lifting constitutes a large part of the day's work. The relation of the lifted weight to the chest and abdomen circumference, the total physical condition of the worker, should be determined and can be settled only by a medical examination before employment.

INDUSTRIAL POISONING.

Another obvious danger calling for close observation in some of the new occupations is that of industrial poisoning. Thanks to Bulletin No. 219 of the Federal Bureau of Labor Statistics, by Dr. Alice Hamilton, we have knowledge of the extent and nature of industrial poisoning in the manufacture of high explosives, so far as it could be ascertained by investigation of the first order. In this country women have not yet been employed in large numbers in the manufacture of TNT, in carrying on those nitration processes whose victims show the same symptoms, suffer, and die exactly as do the victims of gases in trench warfare. Yet it is known to the writer that in one of the worst conducted TNT factories, where the sanitary precautions are nil and the TNT is allowed to cover the ground, the workroom, and the workers themselves, women are among the operatives. As the manufacture of explosives grows by leaps and bounds in this country and new gases are developed and manufactured, as other poisons are increasingly used, such as the various dopes for airplane wings, women will increasingly be employed in these dangerous processes. As a sex they are known to experience more serious injury than men from such an industrial poisoning as lead. This may be true of other industrial poisons not yet studied. Safety here lies only in the enforcement of sanitary precautions, in periodic medical supervision, in the shortening of hours of labor, and in the prohibition of nightwork for women.

OVERFATIGUE AND NIGHTWORK.

In all of the new occupations as in the old, too much emphasis can not be laid upon the factor of fatigue in predisposing to illness and exhaustion. It did not need the well-recorded war-time experience of England to teach us that output together with health and vigor fails when hours of work are excessive, when Sunday work is permitted, and rest at night broken. Yet within the last year even the enlightened State of Massachusetts, the pioneer in labor legislation and for 20 years the leader in prohibiting nightwork for women employed in factories, has under the plea of war emergencies re-established nightwork and overtime by special permit to specified establishments.

It is well known that the greatest efforts have been needed to prevent the breakdown of labor laws in many States and the reestablishment of excessive hours of labor for women.

The labor standards for European countries, especially for women and children, were in many respects lower than our own before the war. In the first rush of industry following the outbreak of the war these standards abroad were still further lowered. Yet it soon proved that the relaxing of standards failed to achieve its purpose; in England and France and more recently in Italy definite steps were taken by the Governments (according to a valuable forthcoming report of the Children's Bureau) to restore the provisions of the labor law in order to maintain output and conserve the workers. In Italy, indeed, the present standards are in some respects higher than before the war.¹

Besides the recent reestablishment of nightwork in factories, another new form of work at night for women in this country is in the elevator service. Here is an occupation newly open to women throughout the land. They are operating elevators in department stores, hotels, and apartment houses, in large and small cities, from California and Utah to Texas and Maine. The work itself does not appear ill-adapted or injurious. The hours of duty, however, are often excessive and can not fail to be harmful. In New York City, for instance, girls are working in apartment houses 15 hours at a stretch; day and night work alternates each week, and when the shifts change the girls are on duty without relief from 6 p. m. to 12 o'clock noon, a continuous stretch of 18 hours. The girls are required to attend to the switchboard telephone as well as to run the elevator. Sunday work is required. One of the most serious abuses of this employment is the exposure of young girls to insult or danger on the all-night shift. In some instances no provision whatever is made for getting rest at night. In other cases an army cot is provided in a hall alcove. In another instance the young elevator attendant sought safety by running the elevator between the first and second landing to obtain sleep between summons.

Nightwork for women has been newly introduced also in connection with automobile cleaning. Women are being employed in New York City garages more than 12 hours each night—from 7 p. m. to 7.30 a. m. They clean from 30 to 35 cars during the night.

Another new occupation which exposes girls to moral dangers is the messenger service. In many cities girls are being increasingly employed to replace boys at this work, which should be closely watched. For the dangers involved in sending young boys to ques-

¹ Child Labor in Warring Countries. Children's Bureau, U. S. Department of Labor, Industrial Series No. 4, p. 61.

tionable houses or resorts has been so great that within the past few years legislation has been enacted in most of the States, raising the age limit of boys in the messenger service and prohibiting their employment after stated hours in the evening. It would indeed be a mockery if young girls were now employed at work which has been found unsafe for boys up to 21 years. To safeguard these young workers, legislation is needed so as to include the new occupations in the existing laws limiting hours of labor, etc. Other States might well follow the enlightened action of the State of Washington, where the employment of female minors in the messenger service has recently been prohibited by ruling of the Industrial Welfare Commission. In some States, too, efforts are on foot to regulate by law the new employment of girls as bootblacks.

THE NEED FOR EQUAL WAGES.

In regard to the general replacement of men by women workers, no single consideration is more important than the matter of wages. This is moreover, not a social or economic question alone. It is primarily a question of health and must be of the first importance to all those concerned with public health issue. It was Gen. Gorgas himself who put in a few trenchant words the close connection between wages and health. He ascribes to the results of increased wages of the common laborers the world-famous improvement in health at Panama, "I am satisfied," he said to a conference of health officers, "that to this improvement in social conditions caused by our high wages we principally owe our extraordinary improvement in general health conditions."¹

Another medical opinion on the relation between wages and health has recently been well put in a study entitled, *Occupation and Mortality*:² "We believe," say Drs. Wynne and Guilfooy, "that wages have a most important bearing upon the morbidity and mortality of any occupation, because, where real wages are high, the standard of living is correspondingly high, housing is better, food is more plentiful and more nourishing, and, in short, conditions are more favorable to physical and mental well-being, which results in greater resistance to disease, more recuperative power, and a healthier enjoyment of life, all of which stimulates the worker to preserve his health and makes him more alert to guard against accidents; whereas when wages are low, home conditions are of necessity unfavorable, and if, in addition, shop conditions are also bad, as they frequently are, the hazards of any occupation are increased manifold."

¹ New York State Department of Health Monthly Bulletin, December, 1915, pp. 369-70.

² *Occupation and Mortality: Their relation as indicated by the mortality returns in the city of New York for 1914.* Reprint No. 400, Public Health Reports, June 8, 1917.

The great danger, from the standpoint of health, is that the employment of women should be resorted to merely in order to obtain cheap labor. As a matter of public health we must see to it that women are paid equal wages for equal work. Otherwise their employment can be and is daily being made the excuse for undercutting the standard wage of men and so reducing the standards of living in the community. The reports of the Children's Bureau and the Public Health Service have shown how infant mortality rises in direct proportion to fall in wage.

It is true that in many of the new occupations women are unskilled and need training. Yet even while they are being trained they should, as a matter of health, be paid an adequate wage. The standards adopted by the Executives' Club of Detroit, to which reference has been made, recommend that, while learning, women shall be paid the flat day rate paid to men for the same work or operation.

There are many other pressing health problems in women's new employment needing wise consideration, which can not even be enumerated here. Instances are beginning to multiply of the lack of decencies and sanitary provisions for women employed in railroad yards and roundhouses. The housing of women who must leave home is a pressing problem. The matter of clothing is highly important. Women obviously can not do men's work in ill-adapted clothes, such as skirts which are usually too full or too tight for safety, and which are dust gathering in the dangerous trades, or in high-heeled shoes, more quickly inducing fatigue. Separate entrances should be provided for men and women especially in occupations involving heat and grime. The nutrition of the workers, and the provision of restaurants or lunch counters are matters of immense importance.

SUMMARY: THREE ESSENTIAL SAFEGUARDS.

In summing up this brief survey of a large topic, emphasis should be laid upon three essential safeguards for girls and women entering upon men's occupations: Equal wages, additional legislation, and adequate medical supervision. I am aware that in making a plea for this last requisite I am treading upon very difficult ground. The pressure for physicians for military and civilian needs is so great that a plea for new industrial supervision may appear ill-timed. Yet if any one truth has emerged from three years of warfare, it is the indispensable nature of our industrial contribution. To preserve that is a part of the nation's self-preservation.

The methods to be used in obtaining adequate medical supervision are of primary importance, and in this connection the National Con-

sumers' League has engaged in a campaign for the establishment of industrial clinics.

Local conditions must determine whether these clinics should be under private, State, or Federal auspices. But the early diagnosis and treatment of workers suffering from industrial diseases by physicians who know industrial processes and conditions are the only means of more fully learning and controlling these diseases, hitherto little studied. The growing employment of women should be an added incentive to establishing industrial clinics, especially wherever large numbers of workers are engaged in dangerous processes. Where private means or enterprises are lacking, and where work on Government contracts is being done, it would seem peculiarly fitting for the Public Health Service to establish such clinics, and so lead the way in measures of enlightened prevention as well as care.

EMPLOYMENT OF WOMEN AND GIRLS IN GREAT BRITAIN.¹

The position as regards the employment of females in July, 1917, is summed up in the following table, which shows (*a*) the expansion in the employment of women and girls since July, 1914, and (*b*) the extent to which women and girls are directly replacing men, according to the returns made by the employers:

SUMMARY OF THE POSITION AS REGARDS THE EMPLOYMENT OF FEMALES.

Occupation.	Estimated number of females employed July, 1914.	Increase since July, 1914.	Direct replacement of men by women.
Industries.....	2,184,000	518,000	464,000
Government establishments.....	2,000	202,000	191,000
Gas, water, and electricity (under local authorities)....	600	4,000	4,000
Agriculture in Great Britain (permanent labor).....	80,000	23,000	437,000
Transport (excluding tramways under local authorities)...	17,000	72,000	74,000
Tramways (under local authorities).....	1,200	16,000	16,000
Finance and banking.....	9,500	54,000	53,000
Commerce.....	496,000	324,000	328,000
Professions.....	67,500	20,000	21,000
Hotels, public houses, cinemas, theaters, etc.....	176,000	22,000	38,000
Civil service, post office.....	60,500	45,000	51,000
Civil service (other than post office).....	4,500	53,000	48,000
Services under local authorities (other than tramways)...	196,200	29,000	23,000
Total.....	3,295,000	1,382,000	1,354,000
Agriculture in Great Britain (casual labor).....	50,000	39,000	38,000
Grand total.....	3,345,000	1,421,000	1,392,000

The growth since the war in the numbers of women employed in the metal and chemical trades, which cover most of the munition trades, is shown by the following table:

COURSE OF EMPLOYMENT OF WOMEN IN INDUSTRY.

	Numbers employed in metal and chemical trades.	Numbers employed in other industries.	All industries.
July, 1914.....	210,000	1,974,000	2,184,000
December, 1914.....	214,000	1,893,000	2,107,000
July, 1915.....	253,000	2,040,000	2,293,000
December, 1915.....	316,000	2,070,000	2,386,000
July, 1916.....	440,000	2,082,000	2,522,000
January, 1917.....	525,000	2,060,000	2,585,000
July, 1917.....	616,000	2,086,000	2,702,000

The numbers employed in the munition group have been above the prewar level at every date shown in the table, even as early as

¹ The Labour Gazette, London, November, 1917, p. 395.

December, 1914, when the other branches of industry were still suffering from unemployment. This growth in the numbers employed has been continued ever since, but at varying rates. Between December, 1914, and December, 1915, the numbers increased by about 100,000, but this increase for one year was easily surpassed in the following six months alone. Since July, 1916, the increase in the metal and chemical trades has not been maintained at quite the same rate, but, nevertheless, the numbers now employed are nearly 180,000 above those for that date.

It was during the same months (December, 1915, to July, 1916), that the employment of women in Government establishments received its greatest impetus. Thus in the establishments engaged on engineering work the numbers of women rose in that half-year from 2,700 to 32,500.

The position in the nonmunition industries is very different. They recovered from the first shock of war in the early part of 1915 and passed through a period of great activity when there was comparatively little competition for labor from the munition trades; as a result, between December, 1914, and July, 1915, there was an increase of nearly 150,000 in the numbers employed, though during this time the munition trades only increased by 39,000. This is the only period when the nonmunition trades drew in more women than the chemical and metal trades. During the latter half of 1915 and again during the first half of 1916 there was a further, though a quite slight, increase of women in the nonmunition trades, but between July, 1916, and January, 1917, the numbers fell very considerably, and this decrease has only just been made good, the figures for July, 1916, and July, 1917, being approximately equal.

The relation between the growth in the numbers employed and the numbers replacing men is very different in the munition and nonmunition trades. In the metal and chemical trades, in which the volume of work has developed enormously, the increase in the number of women employed is much in excess of the numbers replacing men. The reverse is true for all other industries; that is to say, the number of women employed on what was previously regarded as women's work has declined, and the increase in numbers is due entirely to replacement.

The figures as to employment in the metal and chemical trades in the above table do not show the full extent of the movement of women to munitions work, since all Government-owned establishments are excluded, in which the number employed is now 204,000. The number of women engaged in making munitions can not be stated exactly. The majority of the women in the metal and chemical trades are making munitions, but there are a considerable number

still on private and nonmunition work. On the other hand, there are a certain number in trades other than the metal and chemical trades who are engaged in the manufacture of munitions, and this number can only be roughly estimated. Taking all the relevant factors into consideration, it is believed that about 670,000 are employed on munition work, whilst 632,000 women are engaged on other Government work, such as the manufacture of clothing and food for the troops.

INDUSTRIAL UNREST IN GREAT BRITAIN.

The full report of the British Commission of Inquiry into Industrial Unrest has recently been reproduced in Bulletin 237 of this bureau. The report is presented in eight sections, showing the results of inquiries in eight separate districts of Great Britain. The commission was appointed June 12, 1917, and the completed report was submitted July 17, 1917.

The reports for all the districts emphasize as the leading cause of industrial unrest the fact that the cost of living has increased disproportionately to the advance in wages and that food distribution is unequal. Another cause regarded as particularly serious is the restriction of personal freedom under the Munitions of War Acts, by which workmen have been tied up to particular factories and have been unable to obtain wages in proportion to their skill; in many cases the skilled man's wages were less than those of the unskilled. The requirement of leaving certificates was reported as one of the chief causes of dissatisfaction, but this restriction has been abolished by an order of the minister of munitions, effective October 15, 1917, under which any munitions worker may leave his present employment for other war work by giving a week's notice, or such longer notice as is provided for in his existing contract of service.

Dilution of labor and lack of confidence in the Government growing out of the surrender of trade-union customs and the fear that promises regarding the restoration of prewar conditions will not be kept are given special attention. It is stated that the irritation caused by the withdrawal of the trade-card scheme under the military service acts has subsided, but there remains much anxiety regarding the working of the schedule of protected occupations. All the reports refer to the lack of coordination between Government departments in dealing with labor, and considerable complaint on account of the delay in dealing with disputes and the difficulty of securing prompt awards is reported.

Besides the more general causes of industrial unrest certain causes, such as inadequate housing, liquor restrictions, and industrial fatigue,

are mentioned as acute in some districts. Mention is also made of lack of proper organization among the unions, inconsiderate treatment of women as regards wages, delay in granting pensions to soldiers, and inadequacy of compensation under the workmen's compensation act.

A number of recommendations are made by the commissioners. Of these the first is that there should be an immediate reduction in food prices, the increased cost of food to be borne to some extent by the Government, and that there should be a better system of distribution. The necessity of reducing hours, readjusting wages to a fairer basis for skilled as against unskilled workmen, the fuller use of trade-union machinery, and renewal by the Government of the declaration that trade-union rights and privileges which have been interfered with on account of the war shall be restored after the war are insisted upon. The commissioners strongly urge the adoption of the principle of the Whitley report for the establishment of industrial councils for each of the organized trades, such councils to be composed equally of employers and employees. This report, otherwise known as the interim report of the reconstruction committee on joint standing industrial councils, is reproduced in full in the bulletin under review. Regarding the settlement of disputes various suggestions are offered, to the effect that one central authority should be constituted, that local arbitration tribunals should be formed, that local commissioners with technical knowledge to settle disputes should be appointed, and that workshop committees should be established.

Other recommendations are that compensation under the workmen's compensation act should be increased, that announcement should be made of the Government's policy as regards housing, that pensions committees should have larger discretion in their treatment of men discharged from the army, that the recruiting system should have most careful handling, that the work of Government departments dealing with labor should be more thoroughly coordinated, and that when an agreement is drawn up between representatives of employers' federations and trade-unions it should be binding on all in the trade concerned.

While the report shows very clearly the prevalence and the nature of industrial unrest in Great Britain, it at the same time indicates that "there is a strong feeling of patriotism on the part of employers and employed throughout the country and they are determined to help the State in its present crisis."

PRECAUTIONS TO BE OBSERVED IN THE EMPLOYMENT OF FEMALE LABOR IN WAR INDUSTRIES IN FRANCE.¹

The minister of munitions, under date of July 1, 1917, issued the following instructions relative to the employment of female workers in establishments engaged in the manufacture of war materials:

Age limits.—Girls having completed their thirteenth year may be employed, except in unhealthful shops. Females under 18 years of age may not be employed in dangerous working places or where considerable physical effort is required. They may be employed in powder factories only after reaching their sixteenth year, after medical examination, only in daywork and where their health is not in jeopardy.

Hours of work.—The hours of daily labor shall not exceed 10, with one or more rest periods amounting to one hour at least. The hours may be increased under stress of conditions, but not so as to include persons under 18 years of age.

Any person over 18 years of age may be employed at nightwork. Persons under that age shall not be employed between 9 p. m. and 5 a. m. Between the ages of 18 and 21 years, workers shall be selected according to their physical ability and family necessities.

Weekly rest days.—One rest day per week is recommended whenever possible. Sunday is preferable. In shops where continuous work is a necessity, the day of rest shall be accorded by turns, and where the three-shift system is in operation, 24 consecutive hours of rest shall be permitted if possible.

Maternity.—In cases of approaching maternity a change of work must be arranged for unless the work being performed permits the prohibition of nightwork and extra hours. Of the systems of working hours in use, that of the eight-hour shift is most suitable, but daywork on half time is still better. Constant standing in one position is prohibited, and work must be given which permits a continuous or predominantly sitting position. Great physical effort must be avoided. Harmful positions of the members or trunk of the body are prohibited. Protection against concussions, shocks, jars, and vibration, especially of the abdomen, must be provided. One month's rest immediately before maternity, or earlier, if prescribed by a physician, and a period of four weeks after must be granted. None of the measures for protection of women employees approaching maternity shall cause reduction of earnings. Periodic physical examination by physicians or midwives under the supervision of a physician shall be assured.

Nursing rooms, etc.—Nursing rooms, day nurseries, and infants' guard rooms are required as recommended by the committee on

¹ Bulletin du Ministère du Travail et de la Prévoyance Sociale. June-July, 1917, p. 63.

female labor. Every establishment engaged in the manufacture of materials for national defense is required to provide a nursing room supplied with cradles, reserved exclusively for breast-fed babies. Here the babies shall be kept during working hours, and the mother shall be permitted without loss of earnings to leave her work for one-half an hour in the morning and one-half an hour in the afternoon for the purpose of nursing her child. Such mothers shall work in a sitting position and at daywork only. For children fed from the bottle an infants' room with cribs, and for children from 1 to 4 years of age a children's room shall be provided. Daily examination of children as they reach these rooms to discover contagious diseases is required, and all "doubtful" cases must be isolated and placed under individual care.

Mothers' allowances.—Every mother, whether paid by the day or otherwise, nursing her infant at the breast shall receive a bonus of 10 francs (\$1.93) per month and also a premium of 25 per cent of her basic wage, but absences under these arrangements shall not exceed $1\frac{1}{2}$ hours on any one day.

Supervision.—The establishment of a local advisory committee having a majority of its members female employees is recommended. This committee shall supervise the well-being of female workers, and designate one woman, preferably a mother, of unquestioned morality, cognizant of labor conditions, and of general hygienic requirements, and having the necessary tact and firmness of character to supervise women's work. She shall have special supervisory authority over matters relating to care of cribs, nursing room, infants' rooms, living, clothing, wash, lunch, and sleeping room, and in general all matters pertaining to the welfare of female laborers.

General and industrial hygiene.—When workers are housed in lodgings provided by the employer regular cleaning and moist dusting of floors, walls, and ceilings, frequent renewal of mattresses, disinfection of bedding, provision for suitable ventilation, and of sufficient heat during winter, are specifically required. Attention is also called to the necessity of an abundant supply of pure water, and the desirability of adequate lavatory and laundry facilities. It is also desirable to make special employees responsible for the cleanliness and hygienic condition of these cantonments.

Employers are urged not to confine their attention to the housing conditions of the workers lodged on their premises alone, but to consider also those who lodge elsewhere. They should take an active and helpful interest in all matters relating to the welfare of their employees, including lodgings, food, transportation, and any other, matters upon which the employees' health and comfort depend.

Sweeping, etc.—Dry sweeping in workrooms is condemned. When toxic substances are handled frequent cleaning with abundant water is required. In establishments not under continuous operation such cleaning is recommended immediately after ceasing work. A thorough cleaning of floors, walls, and ceilings is required once each week, at least. Exhaust systems are recommended for the removal of dust.

Crowding.—In relation to overcrowding it is recognized that difficulties are encountered in reconciling intensive production and sufficient working space, but overcrowding must not be permitted. The law provides a minimum space which in practice should be increased. Continuous currents of air when the generation of dust is suspected, double windows preventing intake of exterior dust, and ventilating chimneys or other efficient methods of artificial ventilation must be provided.

Lunch rooms—Drinking water.—Laws are in force prohibiting lunching in workrooms, and derogations of this law will not be permitted unless upon substantial reasons and after a thorough investigation by the minister of munitions. If lunch must necessarily be eaten in the establishment an appropriate room separated from the workrooms is suggested. Lunches may be here deposited in individual lockers closed with a key or clasp. Either stoves or steam tables for heating lunches must be provided.

Frequent analysis or other adequate examination of the condition of the water supplied for drinking is required, and should impurities be found immediate measures must be taken to sterilize and purify it. Occasionally the supply of pure drinking water may be temporarily interrupted, or the milk usually supplied to workers in toxic substances may run short. In either case the difficulty may be met by supplying boiled water, preferably with a slight infusion of some aromatic substance—tea, for instance.

Clothing.—Precautions regarding noninflammable and durable clothing for men engaged in dangerous work must be applied as well to women so engaged, the form, quality, and character depending always on the work in which engaged. Flowing garments are prohibited. In some occupations close-fitting blouses fastened at the neck and wrists are suitable, but for women working about machinery overalls are recommended. Caps completely covering the hair should be worn. When leaving the workrooms, work clothing must be deposited in well-ventilated individual lockers. Separate lockers are required for street clothing. Regular cleaning and repair of work clothing is obligatory.

Dressing rooms—washstands—shower baths.—Dressing rooms and washstands with running water should be at once installed in estab-

lishments not already thus equipped. These should be simple but comfortable, and their installation need not involve either much delay or great expense. Especial stress is placed on the installation and the enforced regular use by all employees of shower baths in establishments using chlorates or other toxics.

Water-closets.—Separate closets for women are obligatory and regulations relating to construction, maintenance, and disinfecting formulas are given.

Flies and mosquitoes.—Places in or near cantonments susceptible of breeding flies or mosquitoes must be rendered innocuous by chemicals or fire. Protective measures against their entrance into working places or living rooms are required.

Temperature, etc.—Methods of heating are recommended. A normal temperature must be maintained. Gas, oil, and petroleum heaters may be used only under exceptional conditions. Establishments are required to adopt methods to control the generation of noxious gases and the dissemination of dust, etc.

Dangerous and unhealthy occupations.—Women and young persons are not permitted in places where noxious emanations or deleterious vapors are given off in the manufacture of certain chemicals. Under the observation of special rules relative to hygiene and safety, females over 18 years of age may be employed in the manufacture of certain classes of powder and modern explosives, and, under proper precaution, in the mechanical sifting and barreling of picric acid.

Occupational diseases—Morbidity.—Every director or manager operating under the stress of national demands for national defense is required to make quarterly reports relative to the morbidity of the employees in his establishment—one relating to female, one to colonial, and one to male employees. Every epidemic shall be made the subject of a special report. Every death in the working force due to accident or to industrial poisoning must be reported within 48 hours.

Prophylactic measures, occupational diseases.—The use of certain protective appliances, such as masks, moist nose and mouth sponges or cloths, in addition to those already mentioned, must be insisted upon. Cloths and sponges must be frequently washed in tepid alkaline or acidulated water. Tissot masks are required in all places where there is extreme danger. In certain classes of work, gloves and goggles must be worn.

Accident-prevention devices.—Extra precautions must be observed for places where explosives, detonating gas, or inflammable powder is manufactured or stored. Safety lamps alone may be used. Conductors of electricity should be thoroughly insulated and placed out of reach of the hand, and every device which may emit sparks must

be adequately covered. Special rules have been already issued relative to fire protection.

Frequency of burns.—Burns appear with great frequency in the lists of industrial accidents and are responsible for much loss of time. Methods of handling work should be subject to minute precautions with a view to avoiding such accidents, and whenever possible dangerous operations should be modified or safeguards introduced. The individual worker should be protected against such risks by non-inflammable clothing, gloves, mask, and goggles. In places of special risk, vats of water into which the workers may throw themselves in case of need are recommended.

Medical-aid service.—Consulting offices, adequate first-aid station, a cantonment hospital, and a pharmacy are desirable. The necessity of providing medical service to be utilized in cases of accident and sickness, and in assisting in selection of employees, in making professional visits to the establishment, in supervision of the health of the employees, and in detecting epidemics is urged.

SETTLEMENT OF LABOR DISPUTES IN PRIVATE ESTABLISHMENTS MANUFACTURING WAR MATERIALS IN FRANCE.¹

Under date of September 17, 1917, the minister of war issued a decree relative to the settlement of disputes between employers and employees. The provisions are:

Employers and employees in any establishment engaged in manufacturing arms, munitions, or war material, in which a collective dispute arises, are forbidden to break the contract of employment or to cease work until the question at issue shall have been submitted to conciliation and arbitration.

The minister of war shall designate in such districts as he may deem necessary a permanent conciliation and arbitration committee, consisting of representatives of employers and of employees in equal numbers. The committee shall be composed of at least four members, none of whom shall be subject to mobilization.

A declaration of the question in dispute shall be prepared either by the employer, or his agent, or by an employee duly accredited by at least 20 subscribing employees. This declaration is then forwarded to the official supervising the production of the particular class of goods affected, who shall notify the proper conciliation and arbitration committee. This committee shall meet in the office of the mayor with as little delay as possible. A full hearing shall be granted each party, and an effort made to reconcile the differences. Failing

¹ Bulletin du Ministère du Travail et de la Prévoyance Sociale, August-September, 1917.

in this the committee shall render a decision within 24 hours after the last hearing. This award shall be signed by all members and entered as of record in the committee's minutes of proceedings.

If the members of the arbitration committee fail to agree, the committee shall designate one or more umpires for the purpose of arriving at a decision. Should the members not agree on an umpire or umpires the minister of war shall make such appointment, or call the issue before him for decision.

The umpire or umpires so appointed shall immediately hear the evidence of the former committee and of the interested parties, and within 24 hours after the last hearing shall render a decision and enter it upon record in their minutes.

The arbitral decision rendered by the committee or umpire and approved by the minister, or that made by the minister shall become effective immediately, or upon his order, and be posted by the employer in his workrooms, or if he fails to do so, it shall be posted at his expense.

If the employer refuses to accept the terms of the award the establishment is requisitioned in accordance with present laws.

If the award grants supplemental pay, under whatever title designated, either as wages or otherwise, and the employer refuses to comply with this decision, the administrative personnel of the establishment is requisitioned under the provisions of existing laws, in order to secure the extra payment awarded. The funds necessary to carry the award into effect are advanced by the minister of war, and retained from any sum hereafter due the establishment.

If the laborers refuse to accept the terms of the award, they are placed under requisition in accordance with existing laws.

Whenever any competent official shall receive notice of a collective dispute he shall immediately notify the district military authorities, and in order to maintain discipline and continuity of production, that authority shall place the entire personnel, supervising, administrative, and working forces under requisition until such time as an arbitral decision shall be posted.

The award rendered for one or more establishments, or for one or more classes of laborers, may by order of the minister of war be made applicable to all or any portion of other establishments, or to other occupational classes in the district, provided similar conditions exist therein.

This decree does not apply to mobilized workers, but otherwise applies to all establishments engaged in aeronautics, or engineering, and geographic and central administrations of shops and groups of shops organized or operating in the production of material by contract.

It applies to all yards and shops engaged in production for the commissary or health bureaus only when the work upon which they are engaged is for the use of the minister of munitions or for other bureaus themselves subject to this decree.

This decree is operative only to the date of termination of hostilities.

SATURDAY HALF HOLIDAY FOR WOMEN IN CLOTHING TRADES IN FRANCE.¹

The law, dated 11th June last, which laid down the principle of freedom from work on Saturday afternoons for the duration of the war for women employed in the clothing trades in France (See The Labor Gazette for July, 1917, p. 238), provides that the conditions to be laid down for each trade and district shall be prescribed by administrative regulations. The first set of regulations under the act is dated 18th September, and was published in the Journal Officiel of 23d September last. It relates to the following occupations carried on in the Seine Department: Dressmaking, tailoring, men and women's underclothing manufacture, corset making, making up furs, fabric glove making, hosiery, and certain accessory trades, also wig and false-hair making. The hours worked on Saturday mornings in these trades must not exceed four, except in the case of wig and false-hair making, where the limit is five, and in all cases work must cease not later than 1 p. m. In certain of the above-named occupations where seasonal or exceptional pressure of work occurs, the Saturday half holiday may be suspended upon a specified number of occasions in the year, but any work done on Saturday afternoon under such circumstances must be paid for at the overtime rates usual in the occupation.

USE OF ALCOHOLIC LIQUORS AS RELATED TO INDUSTRIAL CONDITIONS IN FRANCE.

The interministerial committee on manual labor in France recently presented its report on an investigation of the effects of the use of alcoholic liquors as beverages.² The report says that in consideration of present conditions, which require the exercise to the fullest capacity of every industrial factor, and especially in so far as they relate to manual labor, the question of alcoholism becomes one of almost vital importance.

¹ The Labour Gazette, London, November, 1917, p. 402.

² Bulletin du Ministère du Travail et de la Prévoyance Sociale. June-July, 1917, p. 275.

It was early recognized that alcoholism was a source of national weakness and shortened industrial production. Reliable reports indicate that a large percentage of absence from work is due to the use of intoxicating liquor; that in the coal mines, at the time the report was submitted, absences amounted to 13 or 14 per cent of possible days of labor, and that this was largely due to intemperance. It is estimated that coal production is decreased for this reason alone by 5 per cent. It is said "The day that liquor traffic is regulated in mining centers then will the question of absence from work be solved." There is not an industry which has not been compelled to report the effects of liquor drinking on production. "Women seem to be particularly affected. Brought into new surroundings, and influenced by unaccustomed conditions, they more readily fall into temptations."

While the law of March 16, 1915, prohibits the sale, either wholesale or retail, of absinthe and similar liquors, this provision is not universally enforced, and in some localities it is openly violated.

The law of March 8, 1917, forbids any person to carry into or to distribute, or any employer, manager, or person in authority as overseer, to permit to be carried into or distributed in any establishment subject to articles 65, Book II of the Labor Code, any spirituous liquors to be drunk on the premises, except wine, beer, cider, pear cider, and hydromel to which alcohol has not been added. Private distillation in excess of 10 liters (10.56 quarts) per year, for family use, of products grown by the distiller, is prohibited. This law is effective for one year after cessation of hostilities.

Recognizing the menace to national industry, the State has attempted, through orders issued by local and military authority, to interdict the sale of alcohol in various districts. The restrictions so ordered have in some cases met with such strong protest that important modifications permitting the sale in determined hours only have been made. Certain commanding generals have issued orders forbidding the sale to mobilized laborers, women, and colonial and foreign laborers.

Both employers and labor organizations have recognized the importance of this question on production. Some laborers' conventions have unanimously petitioned in favor of entirely prohibitive measures. Employers' associations have emphatically expressed the opinion that the liquor traffic is a menace, not only from an economic viewpoint, but to civilization, leading to moral, mental, and physical degeneracy.

The following statement is made by the committee on manual labor:

In a greater degree than ever the future will demand a population ever increasing in strength and numbers and in its aptitude for industrial labor.

The sale, distribution, or clandestine storing of alcoholic, as well as all other spirituous liquor for drink should be prohibited during the war.

Existing laws regulating places where such liquors are sold as beverages, the suppression of public drunkenness, and the sale and manufacture of absinthe should be rigorously enforced; and the use of alcohol for industrial purposes should be intensified to its fullest possible extent.

INTOXICATING LIQUORS IN GOVERNMENT-CONTROLLED SHOPS.¹

According to a circular of August 5, 1917, the use of intoxicating liquors as a beverage was still a cause of deep concern with the War Office. The minister of munitions addressing the labor controllers said, "While there is no penalty provided by law which seems efficacious against the pernicious influence of places where liquors are dispensed, yet the state of war provides measures which no one in authority should hesitate to employ, i. e., the closing of such places as are convicted of contravention."

The controllers are required to report to the minister all cases where abuse is noticed, and to call upon military authority to immediately close the offending selling place. They are also required to report all action taken, and all penalties imposed by them.

"It being indispensable that drunkenness be repressed with great severity, especially repeated intoxication, controllers are required to report all such cases to the minister in order that he shall suggest the penalties to be imposed, and it is ordered that notices of such penalties shall be posted for the information of laborers."

¹ Bulletin du Ministère du Travail et de la Prévoyance Sociale. August-September, 1917, p. 95*.

PRICES AND COST OF LIVING.

RETAIL PRICES OF FOOD IN THE UNITED STATES.

The retail price of food as a whole shows a decrease of 1 per cent in November, 1917, as compared with the month previous. Of the 27 articles for which prices are reported to the Bureau of Labor Statistics 12 decreased in price, 4 remained the same, and 11 articles showed an increase as compared with October.

Pork chops decreased 11 per cent; hens, 5 per cent; sirloin and round steak, 4 per cent each; flour, 3 per cent; and sugar, 2 per cent. Onions increased in price 18 per cent; lard and butter, 4 per cent each; eggs, 5 per cent; potatoes, 3 per cent; rice, 2 per cent; and meal, 1 per cent. Beans, bread, ham, and bacon remained the same price as in October.

The following table shows the course of prices in the United States in October and November, 1917:

AVERAGE MONEY RETAIL PRICES AND RELATIVE RETAIL PRICES OF FOOD ON OCT. 15 AND NOV. 15, 1917.

[The relative price shows the per cent that the average price on the 15th of each month was of the average price for the year 1916.]

¹ 16 ounces, weight of dough.

In the year from November 15, 1916, to November 15, 1917, prices of food as a whole advanced 23 per cent. Potatoes is the only article that shows a decline in price. Corn meal advanced 87 per cent; bacon 62 per cent; pork chops 48 per cent; beans 39 per cent; salmon 38 per cent; milk 33 per cent; and lard 27 per cent.

Food as a whole was 48 per cent higher on November 15, 1917, than on November 15, 1913, and 46 per cent higher than on November 15, 1914. During this four-year period, corn meal advanced 127 per cent; flour 109 per cent; lard 104 per cent; bacon 77 per cent; sugar 75 per cent; and potatoes 72 per cent. No article declined in price.

Taking November in each of the four years, November, 1915, only shows a decline in price of food as a whole when compared with the same month in a preceding year. For November, 1915, the price of food as a whole was the same as in November, 1913, and was 1 per cent lower than in November, 1914.

A table showing the average and relative retail prices in November of each year from 1913 to 1917 follows:

AVERAGE MONEY RETAIL PRICES AND RELATIVE RETAIL PRICES OF FOOD ON NOV. 15 OF EACH YEAR, 1913 TO 1917, INCLUSIVE.

[The relative price shows the per cent that the average price on Nov. 15 of each year was of the average price for the year 1916.]

¹ 16 ounces, weight of dough.

The two tables which follow give average retail prices for 29 articles in 45 cities.

For 16 cities average prices are shown for November 15, 1913, November 15, 1916, and for October 15 and November 15, 1917.

For 29 cities average prices are given for November 15, 1917. The prices for groceries in Jacksonville, Fla., are not shown, as less than 80 per cent of the grocers of that city sent in their reports to the bureau.

AVERAGE RETAIL PRICES OF THE PRINCIPAL ARTICLES OF FOOD FOR 16 SELECTED CITIES ON NOV. 15, 1913, 1916, AND 1917, AND OCT. 15, 1917.

[The average prices shown below are computed from reports sent monthly to the bureau by retail dealers. As some dealers occasionally fail to report, the number of quotations varies from month to month.]

PRICE CHANGES, WHOLESALE AND RETAIL, IN THE UNITED STATES.

Figures compiled by the Bureau of Labor Statistics furnish a comparison of wholesale and retail price changes among a number of important food articles since 1913. In collecting data for the comparison it was found that in some instances slight differences of grade or quality existed between the articles for which wholesale prices were obtainable and those for which retail prices could be secured. It was found impracticable, also, in most instances to obtain both kinds of quotations for the same date. The retail prices shown are uniformly those prevailing on the 15th of the month, while the wholesale prices are for a variable date, usually several days in advance of the 15th. For these reasons exact comparison of retail with wholesale prices can not be made. The figures are believed to be of interest, however, in showing price variations in the retail as compared with the wholesale markets.

In the table which follows the wholesale price is, in each case, the mean of the high and the low quotations on the date selected, as published in leading trade journals, while the retail price is the average of all prices reported directly to the bureau by retailers for the article

and city in question. To obtain a better comparison of wholesale with retail prices, the list of articles has been revised to some extent since the last issue of the MONTHLY REVIEW. The base period has also been shifted to the year 1913 in order to provide a fairer standard for measuring price changes. The initials W. and R. are used to designate wholesale and retail prices, respectively.

WHOLESALE AND RETAIL PRICES OF IMPORTANT FOOD ARTICLES IN SELECTED CITIES.

[The initials W=wholesale; R=retail.]

Relative wholesale and retail prices, expressed as percentages of the average money price for 1913, are contained in the table that follows. A few articles included in the preceding table are omitted from this one, owing to lack of satisfactory data for 1913. It will be seen from the table that since the beginning of the present year the retail prices of most of the commodities included in the exhibit have fluctuated at a relatively lower level as compared with their 1913 base than have the wholesale prices. This is particularly noticeable in the case of bacon, lard, dressed lamb, butter, milk, eggs, flour, corn meal, and potatoes. Comparing November prices with the average for 1913, it is seen that only 3 articles of the 28 included in the table show a larger per cent of increase in the retail than in the wholesale price. These are rib roast at Chicago and dressed poultry and granulated sugar at New York. In most of the other months of 1917 the

retail prices of these articles were relatively lower than were the wholesale prices.

FOOD CONTROL.

GOVERNMENT FOOD CONTROL IN GERMANY.

A report soon to be issued by the U. S. Bureau of Labor Statistics will deal with the food situation in 1917 in the countries of the allied central powers (Germany, Austria-Hungary, Bulgaria, and Turkey). This report, data for which have been obtained from leading newspapers in these countries, gives a general review of the food situation in each of them, and shows what the prospects are for the 1917 harvest, what measures the Government has adopted in the attempt to control the food supply and to secure as far as possible its equitable distribution among all classes of the population, and in what spirit these regulations have been received by the people. A summary of the food situation in Germany is here given.¹

That the outlook in regard to the food supply in Germany is not overbright is recognized by the German press. The bread-grain harvest is believed to be an average one. Herr Sundermann, editor of the German Agricultural Association's bulletin, states: "The yield is, on the whole, that of a medium harvest; here and there it is below this, although the premature ripening has not assumed the proportions feared in certain districts. In any case there will be no grain to spare, as we might have expected from the first, and we shall have to strain every nerve to make the grain last till the next harvest. The good quality, fortunately, guarantees that the bread will be wholesome and more beneficial." The fresh-fruit supply will not be very good, as much of the late fruit was gathered before it was ripe. Much is hoped for from the potato crop, and some imports are expected from occupied territory. In other respects the prospect is not so hopeful and the authorities hardly attempt to make it appear otherwise.

At present the situation, due to the raising of the bread ration and to a better supply of potatoes and other vegetables and of fruit,

¹ The facts in this article were taken from the following newspapers: *Leipziger Volkszeitung*, *Volksfreund* (Brunswick), *Europäische Staats- und Wirtschafts-Zeitung*, *Vossische Zeitung* (Berlin), *Berliner Tageblatt*, *Münchener Neueste Nachrichten*, *Frankfurter Zeitung*, *Schlesische Zeitung* (Breslau), *Berliner Lokal-Anzeiger*, *Vorwärts* (Berlin), *Deutsche Tageszeitung* (Berlin), *Fleischer Zeitung* (Berlin), *Bremer Bürger-Zeitung*, *Hamburger Fremdenblatt*, *Darmzeitung* (Berlin), *Deutsche Landwirtschaftliche Presse*, *Hannoverscher Kurier*, *Die Konjunktur* (Berlin), *Norddeutsche Allgemeine Zeitung* (Berlin), and *Münchener Post*.

is probably easier than it has been for some time. Nevertheless there is in the daily press evidence of very considerable discontent, and that not among the working classes only.

Germany is shown to be confronted with a difficult problem, that of maintaining the proper balance of food supply among the needs of the army, of agriculture, of industry, and of the civilian population. Interesting in this connection, and significant at once of the anxiety of the authorities to obtain fats and of the general shortage of foodstuffs, is an announcement in the *Berlin Lokal-Anzeiger* for October 3, 1917, that the collecting offices are paying cash or soup cubes for fruit kernels and melon seeds, from which to extract oil for margarine. This payment in soup cubes—which are rated at the cash price of $2\frac{1}{2}$ pfennigs (0.6 cent) per cube—is a special favor.

In regard to the live stock and meat situation, Herr von Waldow, the new secretary of state for the war food bureau, said in a statement to press representatives:

It is obvious that, besides meeting the needs of the army, we must have regard to the maintenance of agricultural production. Hence, before all, agricultural draft animals must be adequately fed. If, as is unfortunately probable, this is incompatible with the provision of sufficient fodder for the fattening of swine and the maintenance of our present stock of cattle, we must proceed to a systematic reduction of our stock of pigs and cattle. Naturally that will have its effect on the supply of meat, milk, and fat. In the case of meat, a temporary increase in the ration would be followed by a decrease. It will be particularly difficult this winter to keep up the supply of milk and butter.

During the past spring and summer many complaints have been made because of the increasing occurrence of the so-called "food excursions." By this was meant the practice among urban dwellers of going out to the rural districts to secure food illicitly. According to a proclamation issued by the commanding general of the Province of Brandenburg: "People now go out, not merely to buy, but to steal food or take it forcibly; they have the effrontery to help themselves to standing field and garden crops, often long before these are ripe. The injury to the farmers and to our future supply is obvious. Robbing the fields and damaging the crops is in war time a crime, and the strongest measures must be taken against it."

The Government regulations controlling each of the principal foodstuffs—meat, potatoes, fats and oils, eggs, milk, butter, vegetables, fruit, sugar, etc.—are not always successful from all points of view. This fall the Government granted various bonuses for the speedy delivery of potatoes. The object of hastening the delivery was attained. The potatoes poured into the towns at a quite embarrassing rate. In some places rations were doubled; in others two or three weeks' rations were issued in a single week. The potatoes were arriving in such quantities that the communes could not handle them.

Nevertheless the Imperial Potato Office ordered that they be accepted. The consequence was that, for want of cartage facilities, the railroad cars could not be unloaded and stood in the freight yards impeding traffic. The potatoes deteriorated and had to be sorted. Potatoes of the first late variety do not keep well, so people could not store them for winter use, and large quantities were therefore lost to the food supply.

The granting of the bonuses also aroused considerable criticism on the score of the resultant high prices to the consumer. According to the *Leipziger Volkszeitung* of September 3, 1917, the consumer's price must cover the basic price of production, agent's commission, speed bonus, loading bonus, and possibly a dispatch bonus—altogether about 7.50 or 8 marks (\$1.78 or \$1.90) per centner (110.23 pounds). There will still remain cost of freight, carriage, and storage, so that the final price may amount to 10 marks (\$2.38) or more per centner.¹

How the food orders are received in some instances is shown by an article in the above-named newspaper on the occasion of the increase in the bread ration which took effect August 13, 1917:

Those entitled to the supply will quickly discover what this new regulation means to them. Instead of the meat supplement, 500 grams [1.1 pounds] of bread will be supplied till October 1. That this is not sufficient compensation need not be pointed out. After October 1, the 500 grams of bread will be omitted and potatoes will be supplied instead. It is impossible to go on substituting one food for another in the hope of making the consumers believe they are being thus compensated.

Figures taken from the same paper showing the prices of certain articles of food in August, 1917, as compared with those prevailing at the outbreak of the war, indicate that along with the decrease in the food supply has gone an enormous rise in food prices. These figures show that the increases in prices of the principal articles are: Bread, 7 per cent; wheat flour, 30 per cent; lard, 371 per cent; first-quality butter, 142 per cent; condensed milk, 209 per cent; eggs, 357 per cent; potatoes, 233 per cent; and salad oil, 250 per cent.

In one section of the report are shown, as far as data on this point could be obtained, the average weekly food rations in 24 representative towns of Germany for the four weeks ending August 26, 1917. Although food rations are generally fixed by the Imperial War Food Bureau for the whole Empire, in practice the rations apportioned to the civilian population vary greatly from locality to locality and are dependent on the actual supply on hand.

As a step toward making the available food suffice to feed the whole populace, war kitchens have been established in all but 56 of

¹ There are 60 pounds in a bushel of potatoes: \$2.38 per centner is equivalent to \$1.30 per bushel.

the 536 communes which have a population of 10,000 or more each. A person fed at a war kitchen is required to surrender to the kitchen a number of food tickets representing the kinds and amounts of foods furnished him by the kitchen. These food tickets are issued by the authorities, and entitle the holder to purchase the articles of food named in the amounts specified. For meat and potatoes, tickets are required in nearly every town, but fat, pulse, farinaceous foods, and flour are more often supplied irrespective of tickets.

The war kitchens in most towns provide only midday meals, but where evening meals are served allowances are made from a fund provided by the King of Bavaria. This fund applies to all Germany.

The comparative popularity of war kitchens is a good index to the actual condition of the food supply. It is interesting, therefore, to find a statement in the *Münchner Neueste Nachrichten* of September 19, 1917, that in spite of the better harvest there will, according to an official intimation, probably be an increase in the number of people who use the kitchens this year, especially if the fat shortage should increase.

The question of grading food prices according to income has recently been much discussed in the German press. Twenty-one of the larger cities, however, have after investigation given up the idea because of the technical difficulties of drawing a just limit. The fluctuations of income within the year, the taxation according to the previous year's income, the number and age of the children, social obligations—all add to the difficulties. In Altona 84 per cent of the population would belong to the poorer classes, who would have to be privileged. In Berlin the number with a taxable income of over 6,000 marks (\$1,428) forms only 1 per cent. In Elberfeld 85 per cent have a taxable income of less than 2,400 marks (\$571.20). In Saarbrücken 87 per cent earn less than 3,000 marks (\$714).

The limited supply of food and the wide use of food substitutes seem to have had an effect on the public health. During the summer of 1917 numerous reports of the prevalence of dysentery in Germany appeared. An article by Prof. Schwalbe states: "Most of the cases must be considered as a result of war conditions—indigestible or deleterious foodstuffs, or fruit obtained in a less fresh condition than formerly. However, the general opinion is that the bread, badly milled and badly baked, is the cause."

The Berlin *Vossische Zeitung* of September 2, 1917, states: "According to current reports last month, one had the impression that every third person was suffering from dysentery. But such was, in reality, not the case. The infectious cases were limited to a small number, and quite a small percentage was fatal." The article ends, however, with the statement: "The total number of cases of dysen-

tery for Prussia during the period August 5 to 11 was 3,806, with 339 deaths."

The Vorwärts for September 5, 1917, states that "the spring months of 1917, following the bad winter months, show a great increase in the number of deaths from phthisis in Berlin. The monthly tables published by the Berlin Statistical Bureau for the time up to May record for the spring months March, April, and May, 500, 542, and 564 (in all 1,606) deaths from phthisis (including laryngeal phthisis), against 375, 331, and 326 (in all 1,032) deaths in the same months of last year. The deaths from pneumonia also greatly increased. In the three months, 366, 362, and 281 deaths (in all 1,009) were reported, as against 260, 192, and 170 (in all 622) last year. From other diseases of the lungs (including pleurisy) there died 106, 128, and 103 (in all 337) persons, as against 86, 57, and 47 (in all 190) last year. The death roll from the three above-named diseases amounted in the spring of 1917 to 2,952 against 1,844 in the spring of 1916. This increase can only partly be explained by the inclemency of the weather."

The above figures, taken from the official report, show a startling condition of affairs. Comparing the mortality figures for lung diseases for the three spring months of 1917 and 1916, we find that deaths from phthisis increased 56 per cent, from pneumonia 62 per cent, from other lung diseases 77 per cent, and from all lung diseases 60 per cent. The observation that these increases "can only partly be explained by the inclemency of the weather" is over-conservative. A more plausible explanation is underfeeding and bad food. Much has been made in this country of the difference between death from actual "starvation" and death from diseases which prove fatal because of underfeeding and improper feeding. The distinction so laboriously made is without a difference. Deaths have increased because food is insufficient. Consumption and other diseases have merely accelerated death from "slow starvation."

The infant mortality rate has also increased. The Vorwärts states that "infant mortality is unusually high this year in Berlin. It is true that the actual number of deaths is below that of recent years, but this is explained by the extraordinary decline in the birth rate. The proportion of the number of infant deaths to the number of births is considerably more unfavorable this year than last." This organ says that there may be several causes for this lamentable increase in infant mortality, but it should be investigated how far the deterioration in the quality of milk is responsible.

WAGES AND HOURS OF LABOR.

AGRICULTURAL WAGES IN GREAT BRITAIN.

PROVISIONS IN CORN PRODUCTION ACT FOR THEIR REGULATION.¹

Agricultural Wages Board.—The Corn Production Act, 1917, passed on 21st August, provides for the establishment by the Board of Agriculture and Fisheries, after consultation with the Minister of Labor, of an Agricultural Wages Board for England and Wales. The main object for which the Wages Board is established is the fixing of minimum rates of wages for “workmen” employed in agriculture—that is to say, rates of wages which, in the opinion of the Wages Board, are the lowest which ought to be paid to “workmen” in the district for which the rates are fixed. The term “workmen” includes boys, women, and girls, and employment in agriculture includes work not only on farms, but also on osier land, woodland, orchards, market gardens, and nursery grounds.

The minimum rates when fixed will be legally payable as explained below.

Constitution of the Wages Board.—The Wages Board will consist of three classes of persons: (a) “Appointed members,” that is to say, persons directly appointed by the Board of Agriculture and Fisheries who are not necessarily engaged in agriculture, but are expected to form an impartial judgment as between employers’ and workers’ interests; (b) members representing employers; and (c) members representing workers.

The members representing employers and the members representing workers must be equal in number. The appointed members must not be greater in number than one-quarter of the total number of members of the Wages Board.

Minimum rates of wages.—It will be the duty of the Wages Board to fix minimum rates of wages for time-work for all classes of workers, and they may, if they think it necessary or expedient, also fix minimum rates of wages for piecework. These rates, whether for time-work or for piecework, may be fixed so as to apply universally to workers employed in agriculture, or they may be different for different districts, or for different classes of workers, or for

¹ The Labour Gazette, London, September, 1917, p. 314.

different kinds and conditions of employment. In the case of able-bodied men, the minimum rates fixed for time-work must be such as will secure wages which, in the opinion of the Wages Board, are equivalent to payment for an ordinary day's work at a rate of at least 25s. (\$6.08) a week. This provision does not apply in the case of boys, women, and girls. In computing the wages, the value of such customary allowances as are not prohibited by law may be included in so far as the Wages Board may authorize and on a basis of value to be fixed by the Wages Board. Deductions from cash wages in respect of an allowance of intoxicating drink are illegal under the Truck Acts.

Procedure in fixing minimum rates.—Before fixing any minimum rate of wages the Wages Board must give notice of the rate which they propose to fix, and must consider any objections which may be lodged with them within one month; and when a rate has been fixed, notice of such rate must be given by the Wages Board for the information of the employers and workers affected.

Enforcement of minimum rates of wages.—When a minimum rate of wages has been fixed, any agreement for the payment or acceptance of wages at less than the minimum rate is void, and payment of wages at less than the minimum rate renders the employer liable to a fine of not more than £20 (\$97.33) and to a fine not exceeding £1 (\$4.87) for each day on which the offense is continued after conviction therefor, unless he proves that he did not know and could not with reasonable diligence have ascertained that the wages paid were at a rate less than the minimum rate.

In cases, however, where the Wages Board are satisfied that a worker on time-work is affected by any mental or other infirmity or physical injury which renders him incapable of earning the minimum time rate applicable, they may grant the worker a permit of exemption, and so long as any conditions prescribed by the Wages Board on the grant of the permit are complied with, the employer is not liable to penalty for paying the worker wages at less than the minimum rate.

Any worker may complain, or may authorize another person to complain, to the Wages Board that he is being paid wages at less than the minimum rate fixed by the Wages Board, and the Wages Board may, if they think fit, take proceedings on behalf of the worker, either for the recovery of the arrears of wages due to the worker or by way of prosecution of the employer.

Where a worker is employed on piecework, and a minimum time rate, but no minimum piece rate, has been fixed by the Wages Board for the work on which he is employed, the worker may complain, or may authorize another person on his behalf to complain, to the

Wages Board that the piece rate paid to him is so low that the earnings of an ordinary workman paid at such rate would be less than he would have earned for the same work at the minimum time rate applicable to the case; and the Wages Board in that case may direct the employer to pay the difference. The worker may recover from the employer summarily as a civil debt any sum which the Wages Board direct to be paid.

Officers may be appointed for the purpose of investigating complaints and otherwise securing the proper observance of the provisions of the act relating to minimum rates of wages.

*District wages committees.*¹—The Wages Board may, and if required by the Board of Agriculture and Fisheries must, establish district wages committees to act for such areas as the Wages Board may determine.

It is the duty of district wages committees to recommend to the Wages Board minimum rates of wages applicable to their districts. Minimum rates of wages can only be fixed, varied, or canceled by the Wages Board itself, but no minimum rate fixed to apply to an area for which a district wages committee has been established, and no variation or cancellation of such rate can have effect in that area unless the district wages committee has either recommended the rate or its variation or cancellation or has had an opportunity of reporting thereon to the Wages Board.

Provisions of the act now in force.—Some time must necessarily elapse before the Wages Board and district committees are set up and the above provisions come into operation. In the meantime an able-bodied man employed on time-work (but no other class of worker to whom Part II of the act applies) who since the commencement of the act, viz, the 21st of August, 1917, has received payment of wages (including allowances) at a rate which, in the opinion of the court, is less than the equivalent for an ordinary day's work of 25s. (\$6.08) a week, will be entitled to recover the difference from his employer as a civil debt, at any time not exceeding three months after a minimum rate applicable to his work is fixed by the Wages Board. The value of allowances in such cases will, in case of dispute, be determined by the court.

It is advisable, therefore, that employers should at once arrange to pay all able-bodied men employed in agriculture, on time-work, wages for an ordinary day's work equivalent to at least 25s. (\$6.08) per week, and should provisionally agree with such workers as to the customary or reasonable value of any allowances which are reckoned

¹ Composed of an equal number of representatives of employers and workers, respectively, and also one or more impartial persons appointed by the Board of Agriculture and Fisheries.

as part payment of wages. It is illegal under the Truck Acts to reckon beer or cider or other intoxicants as allowance in part payment of wages.¹

REGULATIONS AS TO CONSTITUTION AND PROCEEDINGS OF AGRICULTURAL WAGES BOARD.²

In the October issue of the British Labor Gazette it is noted that the Board of Agriculture and Fisheries has issued provisional regulations with respect to the constitution and proceedings of the Agricultural Wages Board for England and Wales, which specify that the board shall consist of 39 members, of whom seven shall be "appointed members" selected by the Board of Agriculture and Fisheries and the remainder shall be "representative members," representing employers and workmen, respectively, in equal proportion. It is also provided that the Board of Agriculture and Fisheries may, if deemed necessary for the purpose of securing the proper representation of any classes of employers or workmen, nominate additional representative members up to a number not exceeding four (of whom half must be representatives of employers and half representatives of workmen) to serve for such period, not exceeding three years, as it may determine.

The regulations provide for the retirement, at the end of one year from the date of the establishment of the Wages Board, of five members representing employers and five members representing workmen, and for the retirement of similar numbers at the end of two years. Provision is also made for vacating the seat of any "representative member" who, if representing employers, becomes a workman in agriculture, or, if representing workmen, becomes an employer in agriculture, or who fails, without reasonable cause, to attend one-half of the total number of meetings in a calendar year. If, in the opinion of the Board of Agriculture and Fisheries, any "representative member" is incapable of acting as a member of the Wages Board, the Board of Agriculture and Fisheries may determine his appointment, and he shall thereupon vacate his seat.

The term of office, according to these provisional regulations, will be two years for an "appointed member," and, subject to the above-mentioned regulations as to retirement and vacation of seats and the appointment of "additional" representative members, three years for a "representative member."

¹ In a footnote to this article the following statement is made:

"The information set out above gives a general idea of the provisions of the Corn Production Act relating to the fixing and payment of minimum rates of wages, but it must not be regarded as an authoritative interpretation of the measure, which should be consulted in any case of dispute or uncertainty."

² See Labour Gazette for October, 1917, p. 358.

WAGES AND COST OF LIVING IN FRANCE.

The Bulletin de la Statistique Générale de la France (July, 1917) publishes the results of an investigation of wages and cost of living in France for 1911 and 1916.

A résumé of this report, which is based on information furnished by the various councils of prudhommes, labor inspectors, and other officials, was published in the Bulletin of the Minister of Labor,¹ from which source the following data have been selected as showing the general trend of wages and prices during the period mentioned.

The data furnished by the council of prudhommes, or by mayors in localities where no such council is organized, relate to the smaller industrial establishments. They cover 52 occupations, 47 followed by male and 5 by female workers. Reports were received from 156 cities located in 80 departments, and in addition to estimates of wages they show the average amount paid by unmarried laborers for board and lodging.

The average daily wages of male employees in 38 occupations in 1916 was 5.56 francs (\$1.07), as compared with 4.55 francs (87.8 cents) in 1911; wages of female employees in 7 occupations averaged 2.57 francs (49.6 cents) in 1916, as compared with 2.21 francs (42.7 cents) in 1911.

The average monthly expenditure for board and lodging by an unmarried person was 70 francs (\$13.51) in 1911, and 99 francs (\$19.11) in 1916. In calculating the cost of living the average yearly consumption of a Parisian workman's family of four persons has been used as a base. The quantities adopted are: 700 kilograms (1,543 pounds) of bread, 200 kilograms (441 pounds) of ham, bacon, etc., 20 kilograms (44 pounds) of butter, 20 dozen eggs, 300 liters (317 quarts) of milk, 20 kilograms (44 pounds) of cheese, 250 kilograms (551 pounds) of potatoes, 30 kilograms (66 pounds) of beans, 20 kilograms (44 pounds) of sugar, 10 kilograms (22 pounds) of oil (table), 30 liters (32 quarts) of petroleum, and 10 liters (10.5 quarts) of fuel alcohol.

Assuming that the amounts of food consumed remain unchanged and applying to the fixed quantities of different articles the prices furnished periodically by the mayors, the office of general statistics has calculated that the index numbers showing the expenditures for a working family of four persons, based on 13 principal articles of food, have increased from 1,014 in the first quarter of 1911 to 1,466 in the fourth quarter of 1916.

¹ Bulletin du Ministère du Travail et de la Prévoyance Sociale, August-September, 1917, pp. 353-371.

In the following table are shown average hourly and daily wages, by occupations, in Paris and in other cities, for the years 1911 and 1916, and the per cent of increase for the latter year:

¹ Decrease.

The questionnaires were not intended to cover all occupations. In many cases rates of wages in occupations other than those called for

are furnished. These show a much greater range in wages than is shown in the foregoing table, varying in different localities from no change in the case of workers in spices, umbrella makers, weavers, spectacle makers, velvet dyers, etc., to increases of 100 per cent for glove makers, 122 per cent for shoemakers, males, and 233 per cent for shoemakers, females. In 3 instances decreased wages are reported as follows: The daily wages of pipe makers decreased from 7.50 francs (\$1.45) in 1911 to 5 francs (96.5 cents) in 1916, of diamond workers from 10 francs (\$1.93) to 5 francs (96.5 cents), and of fasteners from 3.37 francs (65 cents) to 2.77 francs (53.5 cents).

In addition to these estimates reports covering the years 1913 and 1916 have been received from the labor inspectors. These relate to the daily wages in larger industrial establishments, cover 30 occupations—22 known as men's, and 8 as women's—and are based on a 10-hour day. Some are the prevailing wages in certain cities while others are for a department or a district. The table which follows shows these data by occupations:

AVERAGE DAILY WAGES OF LABORERS AND SKILLED WORKERS, BY SEX AND OCCUPATION, 1913 AND 1916.

If the prices of commodities and the rate of wages before the war be taken as a base, or 100, the index numbers in the following statement will show the relative increase in wages and in cost of living in 1916:

Relative wages of men based on report of—	
Councils of prudhommes (average for 1911=100)	122
Labor inspectors (average for 1913=100)	125
Relative wages of women based on report of—	
Councils of prudhommes (average for 1911=100)	116
Labor inspectors (average for 1913=100)	138
Relative cost of living (average for 1911=100)—	
Board (by month)	141
Household necessities (13 articles)	145

While the cost of living has increased in a proportion relatively greater than the increase shown in wages, the increasing number of members of the family, especially women and young girls, finding employment in industry increases the family income, even though individual wages remain stationary. For this reason the relation between salary and the cost of living is more exactly fixed when the income of the working family instead of the individual salary is considered.

The following data are reported for persons engaged in agricultural labor: Since 1914 daily wages have increased from 3.43 francs (66.2 cents) to 5.15 francs (99.4 cents) when board is not furnished, and from 2.33 francs (45 cents) to 3.52 francs (67.9 cents) when board is furnished, an increase of 50 and 58 per cent, respectively.

Wages paid mine laborers, 1914 and 1916, as reported by the magistrates, show an increase of approximately 18 per cent, but since the wages for 1914 are based upon the normal 8-hour day and those for 1916 are computed upon a 9 to 10 hour day, the estimates for 1916 do not show the workmen's actual gains.

The following table shows average daily wages in various mining districts, 1914 and 1916, and per cent of increase in the latter year:

AVERAGE DAILY WAGES IN VARIOUS MINING DISTRICTS, 1914 AND 1916, AND PER CENT OF INCREASE.

District and mine.	Daily wages in—		Per cent increase, 1916 over 1914.	District and mine.	Daily wages in—		Per cent increase, 1916 over 1914.

¹ Not including monthly allowances of 10 fr. (\$1.93) to men, 8 fr. (\$1.54) to women, and 15 fr. (\$2.90) to children; one-eighth increase in wages, and other benefits for overtime work.

² Decrease of 4.7 per cent.

Average daily wages (based on those reported for the principal cities of various departments) have been calculated for the purpose of showing the general advance in men's wages. Only data applicable to both years, 1911 and 1916, have been used. In the table following are shown average daily wages for men, monthly prices of board, lodging, and food, for single persons, relative cost based upon prices of 13 articles of household necessity, and relative wages in small and large industries in 25 principal cities.

WAGES AND PRICE OF BOARD AND FOOD IN 25 PRINCIPAL CITIES, 1911 AND 1916.

City.	Customary daily wages (males).		Customary price of board (per month).		Index number of retail prices (13 articles of food).		Relative prices, 1916 (1911=100).		Relative wages, 1916 (1911=100).

Hourly wages of female garment workers (all occupations combined), working at home, are reported according to the rates fixed by the wage committees established by the law of July 10, 1915.

The difference in rates in the various districts is considerable. In Cantal the average hourly rate is only 0.18 franc (3.5 cents) while in Seine-at-Marne where the highest rate is reported it reaches 0.46 franc (8.8 cents).

INCREASED PAY FOR CIVIL EMPLOYEES OF FRANCE.¹

As a means of meeting the increased cost of living, a law was passed, April 7, 1917, which granted an increase in the salaries of the civil employees of France and which provided for further allowances to cover family expenses by making specific increases according to the number of children living with such employees and dependent upon them.

In accordance with the provisions of this law a decree was signed, May 3, 1917, regulating the granting of such increases and allowances.

The law and the decree were subsequently modified,² and further increases were granted. As the result of an examination of the law

¹ Journal Officiel de la République Française, Aug. 19, 1917, p. 6574.

² Law of Apr. 7, 1917.

of August 4, 1917, the following measures were taken to complete the temporary provisions made for the purpose of enabling civil employees of the State to meet present conditions of the high cost of living. The decree states:

ARTICLE 1. Beginning with July 1, 1917, temporary supplements to salaries not subject to any deductions for pension funds, shall be granted under the conditions herein provided, to all civil employees of the State who belong to the classes mentioned, and who are paid monthly. These employees are as follows:

1. Officials, clerks (*agents*), assistant clerks (*sous-agents*) definitely employed or serving probationary periods, and supernumeraries subject to the provisions of the laws of April 11 and 18, 1831; June 9, 1853, and April 8, 1910 (Article 85).

2. Clerks (*agents*), assistant clerks (*sous-agents*), and employees who are permanently employed in the service of the State, but who belong to a class organized and paid according to a fixed scale.

In no case shall this decree be applicable to (1) clerks under 16 years of age; (2) employees serving ad interim and persons temporarily employed to fill vacancies during hostilities; (3) employees whose public employment partakes of an accessory nature; (4) employees who during their term of employment are permitted to engage in an occupation, in commerce, or in industry.

ART. 2. Yearly increases in salaries shall be fixed as follows: 540 francs [\$104.22] for those employees whose annual salaries do not exceed 3,600 francs [\$694.80]; and 360 francs [\$69.48] for those receiving 3,600 francs and not over 5,000 francs [\$965] per annum. For those receiving between 3,600 francs and 3,780 francs [\$729.54] the increase shall be such as will make the annual income at least 4,180 francs [\$806.74].

Salaries between 5,000 francs [\$965] and 5,360 francs [\$1,034.48] shall be increased but not to exceed the larger amount.

ART. 3. In determining the amount of salary received consideration shall be given to the gratuities, allowances, perquisites, and other compensation of a supplementary character, allowed by the State, provinces, communes, colonies, and public establishments, as well as to all wages or salaries paid by private parties as a regular income from employment. In all cases allowances for dwellings (*logement*) shall be computed as a part of the salary received.

In cases in which salaries or commissions are variable the income from these sources for the year immediately preceding and for the employee's actual position for that time shall be taken as the base. Deduction shall be made for premiums retained to establish pensions. Commissions, however, shall be exempt in so far as they are subject to deductions for civil pensions. If the employee is furnished free lodgings their value must be considered as a portion of his salary.

ART. 4. Any official, clerk, or assistant clerk receiving a salary not exceeding 5,000 francs [\$965] and having minors under 16 years of age, or incapable of work because of infirmities, dependent upon him shall be entitled to further annual allowances as follows: 100 francs [\$19.30] for each of the first two children; and 200 francs [\$38.60] for each child after the second. A person receiving over 5,000 francs [\$965] shall receive only such an allowance as will make his annual income equal to that of a man receiving 5,000 francs [\$965] and having equal family charges.

Dependents shall be defined as: 1. Children whose care is incumbent upon the parent according to the civil code; 2. Orphaned brothers, sisters, nephews,

or nieces living with the employee; 3. Children of either parent by a former marriage living with the employee. Children in a State institution who are beneficiaries of a fund or other equivalent benefit shall in no case be considered as dependents. This restriction shall not apply to children who have received scholarships only.

When each parent claims the allowances for family charges, they shall be payable only if the larger of the two salaries does not exceed 5,000 francs [\$965], and only one allowance shall be made for each child.

On the first day of each month the allowances for family charges shall be payable for the preceding month.

ART. 5. Temporary and auxiliary clerks, not included in the above provisions, who entered the service before the war, and who have been employed in the same department for five consecutive years, shall be granted annual increases as provided by the decree of May 3, 1917, of 120 francs [\$23.16] for unmarried persons, and 180 francs [\$34.74] for married persons, or for widowed, divorced, or separated persons having children or other dependents under their charge.

They shall also be entitled to compensation for dependents equal to that herein provided for permanent employees, but only under the following conditions: (1) That their salaries do not exceed 5,000 francs [\$965]; and (2) that they do not belong to the excepted class (art. 1).

ART. 6. Special regulations made by each department of the Government shall provide equal increases and allowances for day, job, and piece workers.

Employees attached to services whose administrative officers, taking into account the high cost of living, have, since the outbreak of hostilities, undertaken the betterment of the scale of wages shall be excluded from these benefits.

Persons paid monthly at a day rate, for every day in the year, including Sundays and holidays, shall be considered as monthly employees.

ART. 7. Officials, clerks, and laborers mobilized, and allowed to receive more than one salary (law of Aug. 5, 1914), shall have a right to equal benefits and under similar conditions to temporary allowances, if married, widowed, or divorced, with children legally dependent upon them.

ART. 8. Officials, clerks, and laborers of French nationality paid from the State appropriation, in the foreign or in the colonial service, or in a protectorate shall be allowed temporary increases to be determined by the proper minister and approved by the minister of finance.

FARM LABORERS' WAGES IN HOLLAND.

Relatively very large compensation was paid farm laborers in the Amsterdam consular district during the past harvest season, according to information furnished by the American consul at Amsterdam, under date of October 10. For cutting (with a sickle) and binding wheat or oats, the laborer received per hectare (2.47 acres) 35 to 40 florins (\$14.07 to \$16.08). Twenty years ago, it is said, 6 to 7 florins (\$2.41 to \$2.81) was considered good pay for similar work. During the recent harvest an energetic farm laborer could make as much as 8 florins (\$3.22) per day, and a man, his wife, and two grown children could earn about 125 florins (\$50.25) per week. Wages in other industries, the consul states, have advanced in much less degree than

on the farms, the reason being that other large industries have not made, on the whole, so great an increase of profits on their products as the farmers. "Formerly the Dutch farmer made only a small profit and could afford to pay only corresponding wages. Since the war began his profit has so greatly increased that the present rate of wages is relatively no more to him than the old-time rate, if as much."

WAGES IN THE DOMINICAN REPUBLIC.

The American consul at Puerto Plata, Dominican Republic, states that while there is no fixed scale of wages and no trade-unions in the Republic, there has been considerable advance in the amount paid for different kinds of labor owing to the increased cost of living and the scarcity of workers, most of whom are natives, except during the sugar season, when thousands are brought in from the neighboring islands. The average rates of wages reported by the American consul under date of November 5 were as follows: Day laborers, 60 cents; dock laborers, 80 cents; farm laborers, 50 cents; foremen, \$1.25 to \$2; masons, \$2; blacksmiths, \$1.50 to \$2; carpenters, \$1.50 to \$2; mechanics, \$1.50 to \$3; firemen, \$1.50 to \$2; locomotive engineers, \$2.50 to \$4. Tailors and shoemakers are usually paid by the piece, their earnings ranging from \$2 to \$3 per day. The few factory operatives that are there earn from 50 cents to \$2 per day, depending on their skill and the class of work performed.

EIGHT-HOUR WORKING-DAY BY AGREEMENT IN FINLAND.¹

The second number of the current volume of *Arbetsstatistisk Tidskrift* (the journal of the Finnish Labor Department) contains information with regard to the recent introduction of an eight-hour working-day in various occupations in Finland. Immediately after the revolution the senate passed a resolution introducing an eight-hour working-day in the workshops of the State railways and in the State printing works. Agreements for a like object have been arrived at between employers' associations and trade-unions in the metal, printing, sawmilling, paper and pulp making, and glass industries. Various private employers have also granted a similar working-day to their workpeople; and several municipalities, including Helsingfors, have made the same concession. As the result of this movement it is believed that in the near future the reduced working-day will be operative in most of the industries and in the more important handicrafts of Finland.

¹ The Labour Gazette, London, November, 1917, p. 403.

One of the most important agreements was that arrived at in the metal trade, under which the working hours per week may not exceed 47, the daily hours being eight on ordinary days, and seven on Saturdays and the day before a public holiday, including the 1st of May, which is also to be a holiday. The workpeople undertake to perform overtime work, for which extra payment is to be made at the rate of 50 per cent above ordinary pay for the first two hours, and 100 per cent for subsequent time and for hours worked on Sundays. The pay for work by the job or day is not to be reduced in consequence of the shortened working-day. Where work is done in one shift, this must fall between the hours of 7 a. m. and 5 p. m., one hour interval for meals being permitted.

Two bills relating to the introduction of an eight-hour working-day in industry and in agriculture, respectively, have been put forward by the Social Democratic Party, and are now being considered by the legislature.

UNION SCALE OF WAGES AND HOURS OF LABOR.

The union scales of wages and hours of labor for 101 of the principal trades in 48 of the leading cities in the United States prevailing in May, 1916, are published in Bulletin No. 214, just issued by this bureau. The scales shown are those of the baking, brewing, building, freight handling, stone, metal, millwork, printing, soft drink, and teaming trades.

Reports of weekly wages were received for 99 trades. In 80 of these trades the average rate of wages, taken collectively, was higher on May 15, 1916, than on May 1, 1915. In 19 trades there was no change, and in no trade was the average rate lower. The bakery trades, collectively, received an advance of 2 per cent. All but one of the 17 brewing trades listed in this report received an increase ranging from 1 to 8 per cent. Thirty of the 37 building trades listed received an increase of from 1 to 11 per cent. Chauffeurs, teamsters, and drivers received an increase of 3 per cent. Freight handlers received the greatest increase in any one occupation—14 per cent. Granite cutters had an increase of 4 per cent. All of the metal trades gained an increase of from 3 to 10 per cent. Millwork painters (hardwood finishers) received an increase of 12 per cent. In book and job printing 9 of the 11 trades received an increase, in no case, however, above 3 per cent. In the soft-drink establishment group the increase was from 1 to 5 per cent in the several occupations.

Considering the rates of wages per hour as distinguished from rates per week of the 101 trades, 83 showed an increase, 18 showed no

change, and for none was the rate lower. Taken collectively, rates per hour in 1916 were 4 per cent higher than in 1915, 5 per cent higher than in 1914, 14 per cent higher than in 1910, and 19 per cent higher than in 1907.

The highest scales per hour paid in May, 1916, in a few of the principal trades were as follows: Bricklayers, 87.5 cents in Dallas, Houston, Denver, and San Francisco; carpenters, 70 cents in Chicago; portable and hoisting engineers, 75 cents in Chicago, Detroit, Newark, New York, St. Louis, and San Francisco; hod carriers, 50 cents in Portland, Oreg., St. Louis, Salt Lake City, San Francisco, and Spokane; inside wiremen, 75 cents in Chicago and St. Louis; painters, 70 cents in Chicago; plasterers, 87.5 cents in Dallas, Houston, and San Francisco; plumbers and gas fitters, 75 cents in Birmingham, Chicago, Dallas, Houston, Kansas City, Portland, Oreg., St. Louis, Salt Lake City, San Francisco, and Seattle; structural-iron workers, 75 cents in San Francisco; granite cutters, 75 cents in Boston; stone cutters, 70 cents in Portland, San Francisco, Seattle, and Spokane; compositors on book and job work, 54.2 cents in Denver and Salt Lake City, and on newspapers printed in English (daywork), 75 cents in Seattle; linotype operators on book and job work and on newspapers printed in English (daywork), 75 cents in Seattle.

As to changes in hours of labor, 31 trades showed a reduction of hours between 1915 and 1916, and 69 trades had no change. Only one trade, machinist-operators in book and job printing, had an increase in working hours in the year.

The hours of labor in the metal trades range from 44 to 63 per week, 54 being the predominant number. The printing trades in the book and job and newspaper offices in nearly all of the cities covered have an 8-hour day or less.

The bulletin further shows by index numbers (percentages) the relative changes between 1907 and 1916 in union wages and hours of labor as compared with retail prices of food and in the purchasing power of wages as measured by food.

LABOR STANDARDS.

SUSPENSION OF EIGHT-HOUR LAW ON CERTAIN GOVERNMENT CONTRACTS IN WASHINGTON, D. C.

Under date of December 6, 1917, the following executive order was issued by the President:¹

In order to effect the more expeditious construction of the extensions, alterations, etc., of buildings numbered 500 to 508, Fourteenth Street N. W., Washington, D. C., the early completion of said buildings for the use of activities of the Treasury Department engaged on work in connection with war measures creating a national emergency, and by virtue of the provisions of the act of Congress approved March 4, 1917, entitled "An act making provisions for the naval service for the fiscal year ending June 30, 1918, and for other purposes" (39 Stat. U. S., 1192), whereby it is provided, "That in case of national emergency the President is authorized to suspend provisions of law prohibiting more than eight hours' labor in any one day of persons engaged upon work covered by contracts with the United States: *Provided further*, That the wages of persons employed upon such contracts shall be computed on a basic day rate of eight hours' work, with overtime-rates to be paid for at not less than time and one-half for all hours' work in excess of eight hours," I do hereby suspend the provisions of law prohibiting more than eight hours of labor in any one day by persons engaged in the extension, alterations, etc., of the above-mentioned buildings belonging to the Government in the block on the west side of Fourteenth Street N. W., between E Street and Pennsylvania Avenue N. W., Washington, D. C. This order will take effect from and after this date.

THE UNITED STATES SHIPPING BOARD AND LABOR STANDARDS.

The output of ships from American shipyards depends more upon a sufficient supply of labor and the continuous employment of that labor than upon any other factor, according to Vice Chairman Stevens of the United States Shipping Board.² To secure that supply and continuous employment of labor the Shipping Board has accepted two definite policies.

In the first place the board has established free schools to teach navigation to sailors, oilers, etc., and to train marine engineers. These schools, beginning in the ports of New England, are now

¹ Official Bulletin, Dec. 7, 1917.

² The Nation's Business, Washington, D. C., 1917. Vol. 5, No. 10 (October), pp. 57-59.

located in all the important ports of the east, south, and west coasts. At the present time over 600 men are learning navigation in these free schools. Already there have been more than a thousand graduates, nearly all of whom have been placed on shipboard.

In the second place, the Shipping Board will urge no lowering of the existing standards of labor. These are Mr. Stevens's words on that point:

"Every provision of law which the National Government has passed for the better protection of the workers I believe ought to stand, unless it is obvious to everybody that it is a serious menace and a serious obstacle to the efficiency of labor. This is brought particularly home to the Shipping Board because a good many men engaged in the shipping business have urged the board to recommend to Congress the suspension of the so-called LaFollette Seamen's Act during this war. Let me say right here, with emphasis, that the Shipping Board does not propose to recommend to Congress the suspension of any act which the American people have passed for the better protection of the safety and the welfare of sailors on the seas."

WOMEN IN INDUSTRY.

EMPLOYMENT AND LIVING CONDITIONS OF WOMEN IN CALIFORNIA.

The second biennial report of the California Industrial Welfare Commission, for 1915 and 1916,¹ is devoted largely to studies of the cost of living, of the employment of women and minors in the garment trades and in the laundry industry, to a report on the canning industry, and to a statement of the apprenticeship problem, including an outline of a policy concerning "learners" in industry. It is stated in the introduction that during the biennium the work of the welfare commission had been concentrated on the problem of securing a minimum wage and fixing maximum hours for 20,000 women workers in the canning industry, which had been exempt from all regulative legislation, resulting in excessive hours of labor in many cases. In February, 1916, the commission issued orders fixing minimum wages, hours of labor, and sanitary conditions for women and minors in this industry, and a statement of these rates appears in the present report. It may be said in this connection, however, that these orders have been superseded by new minimum wage rates effective June 16, 1917, and noted in the MONTHLY REVIEW for July, 1917, pages 57 and 58.²

The data on the cost of living is largely a reprint from the first biennial report, in which tables were presented showing the results of a study of this question in San Francisco, Los Angeles, Sacramento, Oakland, and San Diego. From the schedules gathered at that time an estimate of the annual amount actually needed by a woman worker to maintain herself in decency and with some degree of comfort was made, and with this estimate before it the commission early in 1916 established the minimum-wage rates to which

¹ California. Second biennial report of the Industrial Welfare Commission, 1915-16. Sacramento, 1917. 276 pp. Illustrated.

² Further orders covering the fish-canning industry and the laundry industry, effective on January 10 and 15, 1918, respectively, appear on pp. 119 and 120 of this issue of the MONTHLY REVIEW.

reference has been made. This estimate, made in 1914, is reproduced in the report under review, and somewhat abridged is as follows:

Board and room-----	\$300. 00
Clothing, etc.-----	112. 25
Carfare -----	31. 20
Sundries (toilet)-----	10. 00
Medical and dental-----	20. 00
Vacation and amusement-----	15. 00
Laundry -----	12. 00
Total -----	500. 45
Average per week-----	9. 63

In the study of the employment of women and minors in the garment trades in California, which "give employment to more women (approximately 3,000) than any other branch of manufacture in the State save the canning industry," attention was centered on three lines—namely, shirts and workmen's garments; ladies' cloaks, suits, and skirts; and men's custom tailoring. Emphasis was placed on the rates of pay and earnings of women and children, since hours of labor, matters of sanitation, toilet rooms, etc., had been regulated by statute or by rules of local boards of health. The report first takes up the employment of 1,781 women and children in shirt, overalls, and kindred manufactures, giving tables showing the average output and earnings per year of piece-rate workers and describing the processes involved. Although employers, when asked what an average operator in their factory should earn, almost universally replied 25 cents per hour, the tables apparently indicate that a large number of the workers did not earn even 20 cents per hour on most of the work done. Thus, of 656 women employed steadily on one part of the garment 396, or 60 per cent, were working on fronts, cuffs, and sleeve openings or making and putting on collars, which processes were found quite generally to yield the operatives a rate of less than 20 cents per hour. Average earnings ranged from 5.2 cents per hour to 52.2 cents per hour, depending on the kind of work done. Of 214 time workers it was found that 30.4 per cent were rated at under \$9 per week, while 51 per cent were rated at under \$10. The average was \$10.54 per week. Almost all the women, as well as the employers, indicated a preference for the piece-rate system of payment. The piece-rate earnings of beginners in this industry indicate that it takes 32 weeks before 20 cents an hour can be earned on overalls, and 42 weeks before the same amount can be made on shirts by the average girl, as the industry is now organized.

The investigation into the employment of women and children in the men's ready-made and custom-made clothing industry embraced the three cities of Los Angeles, Oakland, and San Francisco, cover-

ing 156 establishments, 85 of which employed 582¹ women. Of this number 458, or 78.7 per cent, were time-rate workers and 124, or 21.3 per cent, were piece-rate workers. Tables presented in the report show that 63.2 per cent of the 288 time-workers for whom information was obtained on this subject received less than \$9 per week, while 73.6 per cent received less than \$10; and that of the 56 piece-rate workers reporting, 33.9 per cent received less than \$9 and 60.7 per cent less than \$10 per week. The average weekly earnings for all workers was \$9.31. Approximately one-fourth of the women reporting worked the full 52 weeks in the year; 54.6 per cent worked less than 25 weeks during the year.

In the cloak, suit, and skirt industry, 22 establishments in Los Angeles and San Francisco were scheduled, 16 covering the entire year ending October 1, 1915, and 6 covering only the month of October. The method of payment and rates of pay were obtained for 452 women. Approximately 90 per cent of the workers were paid time rates. In these cities it was found that of 403 workers 39.2 per cent were rated at less than \$9 per week, while the actual earnings of 69.7 per cent, based on reports for 430 workers, fell below that amount. Approximately 30 per cent of the workers in the first group were rated at \$12 or more per week, while only 10.8 per cent in the last group earned \$12 or more per week. The average weekly rate was found to be \$10.06 and the average weekly earnings \$8.79.

The report states that in Los Angeles the rates of pay, earnings, weeks employed, and hours were all better in ladies' custom tailoring in 1914-1915 than in the cloak and suit industry in the same city.

In the investigation of the laundries of the State establishments employing both men and women were covered in the cities of San Francisco, Los Angeles, Oakland, Stockton, Fresno, San Jose, Pasadena, Colton, Riverside, and San Bernardino. Transcripts of pay rolls were taken during the four weeks of January, 1916, including rates of pay, occupations, number of hours worked, and actual weekly earnings. Information was obtained for 4,328 women and 1,686 men, a total estimated at more than 50 per cent of the laundry workers in the State. The report calls attention to the rather large amount of shifting within the industry, and also the comparatively low percentage of employees who have been in the work for less than one year, ranging from 2.8 per cent in San Francisco to 38 per cent in Los Angeles. This shifting, it is suggested, also varies by occupations, the highly skilled occupations such as shirt press operators, body ironers, and forewomen showing a very low percentage.

¹ This includes 344 women employed during one year in 19 establishments and 238 women employed in October, 1915, in the 66 establishments having no back records.

Taking up the matter of rates of pay and actual earnings, it is stated that of the 4,328 women employed in the industry, 3,720 were paid on a time or bonus basis. The following table shows the per cent of those receiving each classified rate of pay and earning each classified weekly amount in the several cities included in the investigation:

PER CENT OF LAUNDRY WORKERS ON TIME-RATE BASIS RECEIVING EACH CLASSIFIED WEEKLY RATE OF PAY AND EARNING EACH CLASSIFIED WEEKLY AMOUNT IN CERTAIN CALIFORNIA CITIES.

City.	Number of workers.	Weekly rate of pay.				Actual weekly earnings.				
		Under \$8	\$8 to \$8.99	\$9 to \$9.99	\$10 and over.	Under \$8	\$8 to \$8.99	\$9 to \$9.99	\$10 and over.	Average.
San Francisco.....	1,253	0.2	34.1	21.1	44.6	14.2	32.9	17.4	35.5	\$9.89
Los Angeles.....	1,663	53.4	15.8	15.3	15.5	¹ 61.5	¹ 15.7	¹ 9.4	¹ 13.4	7.78
Oakland.....	504	17.7	34.7	20.0	27.6	² 49.7	² 18.0	² 9.9	² 22.4	8.38
Fresno, Stockton, San Jose.....	272	4.4	18.8	34.2	42.6	³ 29.5	³ 26.1	³ 23.9	³ 20.5	8.94
Pasadena.....	139	18.7	42.5	16.6	22.2	⁴ 37.1	⁴ 27.2	⁴ 16.1	⁴ 19.6	8.47
Colton, Riverside, San Bernardino.....	109	67.9	4.6	14.7	12.8	⁵ 73.4	⁵ 7.5	⁵ 10.8	⁵ 8.3	7.05
All cities.....	3,940	27.8	24.9	18.9	28.4	⁶ 43.8	⁶ 22.0	⁶ 13.0	⁶ 21.2	8.55

¹ Based on 322 piece-rate workers in addition to the 1,663 shown in the first column.

² Based on 9 piece-rate workers in addition to the 504 shown in the first column.

³ Based on 5 piece-rate workers in addition to the 272 shown in the first column.

⁴ Based on 41 piece-rate workers in addition to the 139 shown in the first column.

⁵ Based on 11 piece-rate workers in addition to the 109 shown in the first column.

⁶ Based on 388 piece-rate workers in addition to the 3,940 shown in the first column.

From this table it will be seen that the average weekly earnings in all cities was \$8.55, and that 27.8 per cent of the workers were rated at less than \$8 per week, 43.8 per cent actually earning less than that amount.

The average weekly hours worked is shown to be 44.5 for all women employed on a time basis; 64.8 per cent worked between 44 and 48 hours per week.

A table showing the rates of pay and earnings of the 1,686 men scheduled indicates, for all cities, an average of \$15.05 per week as the rate and \$14.89 per week as the actual earnings.

The report includes a statement of the working conditions in California canneries, and reviews the data submitted to furnish the wage board with information covering the producing power of the normal worker when engaged in putting up peaches, tomatoes, apricots, and pears in order that the board might have a basis upon which to determine equitable rates.

The apprenticeship problem as noted in the report is shown in a group of tables taken from the first biennial report of the commission. It may be gathered from these tables that in San Francisco mercantile establishments, for instance, wages seem to bear a marked relation to the ages of employees, the younger workers receiving the lower

wages: that there is not a very decided increase in wages until after two years' experience; and that nearly one-half of the workers scheduled had completed the eighth grade in school. Among San Francisco and Los Angeles laundry workers it appears that education had very little bearing on wages received.

The outline of a policy concerning "learners" in industry was submitted to the welfare commission by Meyer Bloomfield, head of Industrial Service Department, Division of Labor, U. S. Shipping Board, Emergency Fleet Corporation. In this outline emphasis is placed on the fundamental principle that the problem of the learner must be looked upon primarily as a problem of industrial management and organization rather than a purely individual problem, the solution of which depends wholly upon the brightness, ability, etc., of the employee. "The fact that a slow or unpromising learner in one plant shows, by change to another plant, ability not before revealed is proof that something more than the learner's ability frequently determines advancement in an organization." It is suggested that the nature of the conditions to be imposed by the commission may be well founded on objective standards and considerations as, for instance:

Has the employer any system of careful selection of employees?

Is there any organized opportunity for learning the trade?

What is the actual cost to the employer of teaching an employee?

What method is used to determine the learner's progress in order not to delay the payment of earned wages?

Is it cheaper to carry an indefinite number of learners who come and go than to plan permanence for rapid advancement of the learning force?

In dealing with the beginner or learner in industry provision should be made, it is stated, for the inexperienced minor learner, the experienced minor learner, the experienced adult learner, and the inexperienced adult learner. Since shop conditions and methods vary so widely as to make it impossible to frame a teaching policy that will fit all plants, "the task is to discover what is the actual learning procedure in the shops, what is a genuine learning opportunity, and to establish a less-than-minimum wage based on the opportunity or lack of it; that is, the better the opportunity in a given place the smaller the wage, the poorer the opportunity, the smaller the exemption from the regular minimum."

To put a premium on learning opportunity after defining for all employers what such opportunity involves, and to penalize lack of opportunity is to raise the standard of shop management, equalize conditions, and thus advance the best interests of both employer and employee alike.

Several schedules are suggested to be used by the commission in order to arrive at a definition of learning opportunity, these to be filled out by employers and workers, or by the commission's investigators.

MINIMUM WAGES AND MAXIMUM HOURS FOR WOMEN AND MINORS IN THE LAUNDRY AND FISH-CANNING INDUSTRIES OF CALIFORNIA.

In the month of November, 1917, the Industrial Welfare Commission of California issued two important orders establishing minimum wages and maximum hours of labor for women and minors in the laundry industry and in the fish-canning industry of that State. The essential features of these orders are as follows:

LAUNDRY INDUSTRY.

1. No person, firm, or corporation shall employ, or suffer or permit an experienced woman or minor to be employed in the laundry and dry-cleaning industry in California at a rate of wages less than \$10 per week.

An experienced woman or minor is one who has been employed in the industry fifteen (15) months or more.

2. The rate of wages for learners may be less than the minimum rate prescribed for experienced workers, provided:

(a) That learners shall be paid not less than \$8 per week for the first six (6) months of employment; not less than \$9 per week for the second six (6) months of employment; not less than \$9.50 per week for the following three (3) months of employment; and thereafter shall be considered experienced workers and shall be paid not less than the minimum rate prescribed for experienced workers.

(b) That all learners shall be registered by the commission. Application for registration as a learner shall be filed by the employer with the commission not later than two (2) weeks from the date of starting employment. Pending receipt of certificate of registration the learner shall be paid not less than the minimum rate for the wage group in which she belongs.

3. The total number of female learners in any establishment shall not exceed twenty-five (25) per cent of the total number of females employed; except that the Industrial Welfare Commission reserves to itself the right, during the continuance of the present war, to grant special permission to increase the percentage of learners in cases where actual emergency is shown.

4. Where payment of wages is made upon a commission, bonus, or piece-rate basis the weekly earnings shall not be less than the minimum time rate for the wage group in which the worker belongs.

5. All women and minors now employed in the laundry and dry-cleaning industry must be rated and paid in accordance with their period of employment as specified in section 2 (a).

6. Every person, firm, or corporation employing women or minors in the laundry and dry-cleaning industry shall keep a record of the names and addresses, the hours worked, and the amounts earned by such women and minors. Such records shall be kept in a form and manner approved by the Industrial Welfare Commission.

* * * * *

8. No person, firm, or corporation shall employ, or suffer or permit any woman or minor to work in the laundry and dry-cleaning industry more than eight (8) hours in any one day, or more than forty-eight (48) hours in any week.

9. A license may be issued by the commission to a woman physically disabled by age or otherwise authorizing the employment of such licensee for a wage less than the legal minimum wage; and the commission shall fix a special minimum for such a woman.

* * * * *

This order shall become effective sixty (60) days from the date hereof.
Dated November 15, 1917.

FISH-CANNING INDUSTRY.

1. No person, firm, or corporation shall employ or suffer or permit any woman or minor to work in the fish-canning industry in California at a rate of wages less than \$10 per week of 48 hours; or if employed less than 48 hours no woman or minor shall be paid less than 25 cents per hour.

2. Where payment of wages is made upon a piece-rate, bonus, or commission basis the worker shall be paid not less than the minimum time rate for the number of hours employed.

3. No person, firm, or corporation shall employ or suffer or permit an adult woman, eighteen years of age or over, to work in the fish-canning industry more than eight hours in any one day, except in case of emergency: *Provided, however,* That the provisions of this section shall not apply to those occupations coming under the provisions of the Statutes of California, 1917, chapter 582, "An act limiting the hours of work of females," etc.

4. No person, firm, or corporation shall employ or suffer or permit an adult woman to work in the fish-canning industry in case of emergency more than eight hours in any one day at a wage less than one and one-fourth times the rate of wages paid during regular time.

5. No person, firm, or corporation shall employ or suffer or permit any woman or minor to work in the fish-canning industry more than six days in any one week except in case of emergency.

6. No person, firm, or corporation shall employ or suffer or permit any woman or minor to work in case of emergency on the seventh consecutive day in any week at a rate of wages less than one and one-half times the rate of wages paid during regular time.

Emergency work shall be all work performed by any adult woman after eight hours in any one day, or all work performed by any woman or minor on the seventh consecutive day of work in any week.

7. No person, firm, or corporation shall employ or suffer or permit a minor to work in the fish-canning industry more than eight (8) hours in any one day, or more than forty-eight (48) hours in any one week.

8. Every person, firm, or corporation employing women or minors in the fish-canning industry shall keep a record of the names and addresses, the hours worked, and the amounts earned by such women and minors. Such records shall be kept in a form and manner approved by the Industrial Welfare Commission.

* * * * *

10. A license may be issued by the commission to a woman physically disabled by age or otherwise authorizing the employment of such licensee for a wage less than the legal minimum wage; and the commission shall fix a special minimum wage for such a woman.

* * * * *

This order shall become effective sixty (60) days from the date hereof.
Dated November 10, 1917.

EMPLOYMENT AND UNEMPLOYMENT.

WORK OF FEDERAL, STATE, AND MUNICIPAL EMPLOYMENT OFFICES IN THE UNITED STATES AND OF PROVINCIAL EMPLOYMENT OFFICES IN CANADA.

Data are presented in the following table showing the operations of the public employment offices for the month of November, 1917, and in cases where figures are available, for the month of November, 1916. For the United States figures are given from public employment offices in 41 States and the District of Columbia, Federal employment offices in 32 States, Federal-State employment offices in 4 States, a Federal-State-county-municipal employment office in 2 States, Federal-municipal employment offices in 1 State, State employment offices in 16 States, State-municipal employment offices in 3 States, municipal employment offices in 9 States, and a municipal-private employment office in 1 State. Figures from Canadian employment offices are also given.

REPORT OF EMPLOYMENT EXCHANGES IN THE UNITED KINGDOM (GREAT BRITAIN AND IRELAND) FOR FIVE WEEKS ENDING OCTOBER 12, 1917.

As reported by the British Labor Gazette of November, 1917, the total number of workpeople remaining on the registers of the 383 British employment offices on October 12, 1917, was 107,914, compared with 109,216 on September 7, 1917, and with 115,399 on October 13, 1916. These figures comprise workers in professional, commercial, and clerical, as well as industrial occupations.

The operations of the employment exchanges for the five weeks are summarized as follows:

Item.	Men.	Women.	Boys.	Girls.	Total.
On register on Sept. 7, 1917.....	28,247	64,667	7,033	9,377	109,324
Number of individuals registered during period.....	98,728	162,979	25,569	24,344	311,620

EMPLOYMENT IN SELECTED INDUSTRIES IN NOVEMBER, 1917.

The Bureau of Labor Statistics received reports concerning the volume of employment in November, 1917, from representative manufacturing establishments in 13 industries. Comparing the data for November, 1917, with those from identical establishments for November, 1916, it is shown that in six industries there was an increase in the number of employees and in seven a decrease. The cigar-manufacturing industry shows the greatest increase—11 per cent—while car building and repairing shows the greatest decrease—7.9 per cent.

Each of the 13 industries canvassed showed an increase in the total amount of the pay roll for November, 1917, as compared with November, 1916. The greatest increase indicated—49.3 per cent—was in the iron and steel industry. There was an increase of 45.6 per cent in woolen manufacturing.

The following table shows the number of persons actually working on the last full day of the reported pay period in November, 1916, and November, 1917. Many establishments do not keep a record of this fact, and consequently the number reporting such data is small. This should be taken into consideration when using these figures.

COMPARISON OF EMPLOYMENT IN IDENTICAL ESTABLISHMENTS ON LAST FULL DAY'S OPERATION IN NOVEMBER, 1916, AND NOVEMBER, 1917.

Industry.	Establishments reporting for November, both years.	Period of pay roll.	Number actually working on last full day of reported pay period in November—		Per cent of increase (+) or decrease (—).

The figures in the table below show that in 12 of the 13 industries there were more persons on the pay roll in November, 1917, than in October, 1917. The 7.9 per cent increase in the boot and shoe industry was the greatest. The only decrease—3.4 per cent—was in the automobile-manufacturing industry.

All of the 13 industries reporting show an increase in the total amount of the pay roll when comparing November, 1917, with Octo-

ber, 1917. The greatest increase—13.2 per cent—is shown in the cotton-manufacturing industry. There was an increase of 13 per cent for the boot and shoe industry. The silk industry shows the smallest increase—less than one-tenth of 1 per cent.

CHANGES IN WAGE RATES.

Of the 13 industries reporting, all except that of men's ready-made clothing show that changes in the wage rates were made during the period October 15 to November 15, 1917. A number of the establishments did not answer the inquiry relating to the wage rate changes, but in such cases it is probably safe to assume that no changes were made.

In the iron and steel industry, 19 plants report an increase in the wage rates. One plant reports an increase of 11 per cent to about 60 per cent of its employees; three plants report an increase of 10 per cent to all employees; while a fourth reports a like increase to time workers only. One plant reports an increase of 7 per cent to two-thirds of its men. Three plants report an increase of $6\frac{1}{4}$ per cent to 40 per cent of their employees, and a fourth one a like increase to 10 per cent of its force. Three plants report an increase of 5.97 per cent to 50 per cent of their employees, while a fourth reports a like increase to 15 per cent of its force. Two plants report an increase of 5 per cent to 50 per cent and 60 per cent, respectively, of their employees. One plant reports $3\frac{1}{2}$ per cent increase to 60 per cent of the force; one plant reports an increase of 1.6 per cent to 23 per cent of its employees; and one plant reports an increase of 25 cents per turn to all employees.

Increases in wage rates were reported by 14 plants in the cotton-manufacturing industry. Ten plants reported a 10 per cent increase as follows: Three to all employees, one to approximately all, three a "general" increase, one to all except office force, one to 90 per cent of force, and one does not report the part of the force affected. One plant reports 8 per cent to all employees; two plants, an increase of 5 per cent to all employees; and one an increase of 5 per cent to 14 per cent of its employees.

Increase of wage rates were reported by 10 plants in the cotton-finishing industry. Two plants show an increase of 10 per cent to all employees; one shows 10 per cent increase to 98 per cent of its force; and five show a 10 per cent increase to 95 per cent of their employees.

Increases in the wage rates are reported by 6 plants in the paper-making industry. One plant reports an increase of 25 per cent to 90 per cent of the force; one an increase of 15 per cent to male and 10 per cent to female employees; one reports an increase of 20 per cent, but does not state the part of the force affected; and three report an increase of 10 per cent to all employees.

In the hosiery and underwear industry two establishments report an increase of 10 per cent to all employees and a third one 10 per cent to 25 per cent of its employees.

Two plants in the woolen industry granted a 10 per cent increase to all employees, while another granted 10 per cent to all except overseers.

One plant in car building and repairing reported 15 per cent increase to carmen and 10 per cent to foremen; one gave an increase of 2 cents per hour to organized men and $1\frac{1}{2}$ cents per hour to unorganized men; a third reports 10 per cent increase to its clerks.

In the automobile industry one plant reports an increase of 10 per cent to all employees, and one reports an increase of .03 in the productive average hourly rate.

One establishment in the boot-and-shoe industry reports an increase of 10 per cent to 5 per cent of the force.

In the silk industry one plant reports an increase of 10 per cent to 50 per cent of its force.

In the cigar-manufacturing industry one plant reports an increase of 8 per cent to its salaried men—about 2 per cent of the force.

In leather manufacturing, one plant reports an increase of 10 per cent to 95 per cent of its employees.

EMPLOYMENT IN THE STATE OF NEW YORK.

The Bureau of Employment of the New York State Industrial Commission on December 1 issued the following statement concerning the labor market in New York:

A comparison of the figures of the work done by the State Bureau of Employment for the months of November and October, 1917, shows that there was a decided falling off along all the lines, not only in applications for work, but also in requests for help, and of placements. It is very interesting to note that the requests for help for the month of November, 1916, slightly exceed the number of requests for help in the same month, 1917.

Publication throughout the country of an alleged labor shortage still continues, some of these reports being given out by reliable financial institutions. What is really meant in many of the references to shortage is "turnover." On account of the restlessness of workers in many places, this "turnover" has very largely increased in the past few months. This bureau has a report from one large plant in a neighboring State, where there has been a complete change in a force of several thousand workers in the period of one month. There is, at this time, of course, the usual restlessness among all classes of people, due to the fact that we are at war, and are beginning to realize that we are taking an important part in it. This is perfectly natural, and needs a little time for the cure. But, in addition to this, and contributing more largely to the restlessness than anything else, is the constant repetition of the shortage of labor and the frequent publication about abnormal earnings, especially in munition factories. A worker reading of this labor shortage, and these large earnings, gets restless, quits his present job, and goes hunting the elusive one paying very high wages. The different offices of the bureau throughout the

State report a total of several hundred seekers of jobs every day. Many of these refuse to take the available jobs at the wages offered. One branch of the State Bureau of Employment had available over 500 jewelry workers just now laid off by jewelry manufacturers. Notice to this effect was sent to 55 of the largest employers in Greater New York, the notice being sent to those who might be in need of workers with this sort of experience. Only 5 firms out of the 55 answered the communication.

It is time for more sanity on the part of both the employer and employee regarding the present labor conditions. Let us take the figures relating to the actual situation in New York State. The State census of 1915 showed a total population of 9,687,000. Calculating on the percentage basis used by the United States census, there are at the present time in the State of New York about 3,300,000 persons engaged in gainful occupations. On the other hand, from the figures given out, as well as from liberal estimates made, the Army, Navy, and the Red Cross have taken about 140,000 men out of this total of over 3,000,000 workers. Another heavy military draft will have to be made before the labor power of the State is materially affected.

Contributing also to this apparent shortage is the fact that we are confronted with the need in the next few months for a great number of workers to do the technical work coming into existence through the needs of the war. Industry in this country has not heretofore called for such a high number of technically trained men. To solve this need, it will be necessary for employers to get together and decide on the number of workers each one should train to supply this coming need. This should be done in each industrial community through the cooperation of employers needing any kind of technically trained men. The United States is just now teaching thousands of men how to shoot a gun and handle a bayonet. Is it not just as desirable to teach men in this emergency how to handle a tool and a machine? Many thousands of soldiers are at this time just as unfamiliar with the rifle and the bayonet as are thousands of workers with the tool and the machine. We have great numbers of men available for the training. Let us train these now and later absorb them into the industries needing them before we consider the use of large numbers of untrained women.

EMPLOYMENT IN HARTFORD, CONNECTICUT.

The following statement of the condition of employment in Hartford, Conn., as indicated by the work of the State Free Employment Office, is taken from the labor market letter for November, 1917, issued by that office. The work done during the month of November, 1917, the last month in the statistical year, shows a larger number of placements than in any other month during the history of the employment office.

The increase in business was due to the tremendous call for laborers, the number of men placed reaching the high total of 1,025. Twenty-three laborers helped to meet the street department's needs for men to handle ashes; 126 men to work on farms were used, compared with 42 in November, 1916. Little change was noted in

the requirements for culinary help over that of a year ago. For nursery work 41 men were hired.

There were 23 nationalities represented among those who secured positions. A slight falling off in the number of colored male applicants was noted, but the large number of colored women placed (80) gave the colored race third rank in the order of nationality. An unexpected decrease in the number of German applicants was observed, there being but 18, which is less than half of the customary number. The big drive for workers came in the early part of the month, falling off as colder weather approached. The average number of daily placements was 48.8, compared with 46 last month, and 38.4 in November, 1916.

VOLUME OF EMPLOYMENT IN THE UNITED KINGDOM (GREAT BRITAIN AND IRELAND) IN OCTOBER, 1917.

The table below pertaining to the condition of employment in Great Britain and Ireland was compiled from a report published in the British Labor Gazette of November, 1917.

Few important changes relating to the number of employees in October, 1917, as compared with September, 1917, are shown. Seamen show an increase of 11.6 per cent in the number of men; tin plate, steel, and galvanized sheet trades show an increase of 8.2 per cent in the number of mills in operation; white dock and riverside labor shows a decrease of 7.2 per cent in the number of employees. In comparing October, 1917, with October, 1916, on this point, more important changes are seen. Dock and riverside labor shows a decrease of 28.3 per cent, seamen show a decrease of 23 per cent, food preparation shows an increase of 14 per cent, dressmaking and millinery a decrease of 12.2 per cent; while quarrying, tin plate, steel, and galvanized sheet trades, cotton trade, and cement trade, show a decline of more than 10 per cent each.

Earnings show more important changes in the periods under consideration. Comparing October, 1917, with September, 1917, the tailoring trades show an increase of 12 per cent, while food preparation shows an increase of 5.1 per cent. All the other industries show small increases in earnings of employees except the cement trade, which shows no change, and the linen trade, which shows a decrease of 1 per cent.

In comparing October, 1917, with October, 1916, on the question of earnings of employees more important changes are shown, all of them being increases, except the cotton trade which shows a decrease of 1.8 per cent. The linen trade shows the greatest increase—33.5

per cent. Tailoring shows an increase of 31.2 per cent. Eight trades show increases ranging from 11.5 per cent to 19.5 per cent, while the other trades reporting increases of earnings of employees show percentages ranging below 10 per cent.

Casual employment (men only).....	225				1,838					

¹ Occupations are grouped according to the industry with which they are mainly connected and applicants are registered according to the work desired by them.

This table shows that, during the period, in the insured trades 129,542 adults registered for work—61,154 men and 68,388 women. There were 107,292 vacancies reported—64,853 men, 35,213 women, 4,747 boys, and 2,479 girls. The number of positions filled was 83,115—42,675 men, 33,914 women, 4,289 boys, and 2,237 girls. The occupation groups in which the largest numbers of positions were

filled by adults were: Ammunition and explosives, 14,936; laborers, engineering, 10,946; metal machinists, 9,577; works of construction, 6,388; erectors, fitters, and turners, 6,240; other skilled occupations, engineering, 4,671; laborers, building, 4,368.

In the uninsured trades there were 132,165 registrations—37,574 men and 94,591 women. The number of vacancies reported was 83,195—23,618 men, 38,755 women, 9,788 boys, and 11,034 girls. The total number of positions filled was 59,269—15,184 men, 28,483 women, 7,608 boys, and 7,994 girls. The occupation groups in the uninsured trades in which the largest numbers of positions were filled by adults were: Domestic service, 14,309; conveyance of men, goods, etc., 6,505; general laborers, 5,522; commercial and clerical, 4,397.

The totals show that the number of positions filled by adults in both the insured and the uninsured trades during the five weeks ending October 12, 1917, was 20.8 per cent greater than during the preceding four weeks. The number of positions filled by men was 29.7 per cent greater and by women 13.5 per cent greater. Much the largest number of women were employed in the manufacture of ammunition and explosives and in domestic service.

No comparison can be made of the number of registrations in the employment exchanges of Great Britain with the number of applications for work reported by the employment offices of the United States, owing to the differences in method of registering applicants. It is possible, however, to make a comparison of positions filled by the offices in the two countries. The figures show the following results:

	Number of offices.	Positions filled.		
		Total.	Average per day.	Average per day each office.
Great Britain.....	383	142,384	4,746	12.4
United States.....	138	99,723	3,989	28.9

The above figures are significant in view of the fact that a very large percentage, if not practically all, of the employment office work of Great Britain is done through the free employment exchanges, while in the United States but a very small proportion of the placements is made through the public employment offices, the much greater proportion being handled by the private employment agencies.

LABOR ORGANIZATIONS.

THIRTY-SEVENTH ANNUAL CONVENTION OF THE AMERICAN FEDERATION OF LABOR.

In some respects, chiefly owing to labor conditions as affected by the war, the thirty-seventh annual convention of the American Federation of Labor, held at Buffalo, November 12 to 24, 1917, inclusive, was the most important gathering of representatives of organized labor ever held in this country. For the first time in its history the federation was addressed by the President of the United States, excerpts from whose address are noted hereafter.

The report of the executive council showed an unusually successful year for the federation. At September 30, 1917, the total membership was 2,371,434, an increase of 14.4 per cent over the preceding year, affiliated with 26,761 local unions in 111 national and international unions and 845 local trade and Federal local unions. The treasurer reported receipts amounting to \$412,047.76 and expenditures amounting to \$402,440.40, with a cash balance on hand, September 30, 1917, of \$98,967.84. Five hundred and fifty-nine charters were issued to national and international, central, local trade, and Federal labor unions. In reporting the distribution of benefits to members it is explained that in every trade local unions have existed prior to the formation of the international union, and almost without exception they provide death, sick, out-of-work, etc., benefits for their members. In these instances benefit features have thus become identified and recognized as belonging to the jurisdiction of the local union. The amounts given hereafter as having been expended by the international unions on account of various benefits in the past year are, in the majority of cases, those paid directly by the internationals, and therefore the totals represent but a small proportion of the aggregate sum paid by trade-unions in the way of benefits. In most instances benefits paid by internationals are supplemental relief paid to members in addition to the benefits provided by their local unions. The benefits paid to members by affiliated organizations during the year were as follows:

Death benefits-----	\$3, 034, 586. 36
Death benefits, members' wives-----	77, 423. 50
Sick benefits-----	838, 606. 91
Unemployed benefits-----	30, 316. 43
Traveling benefits and tool insurance-----	4, 136. 71
Total-----	3, 985, 069. 91

Reports from 75 national and international organizations and from local unions directly affiliated with the American Federation of Labor show that there were 1,417 strikes in which 194,802 people were involved, the cost of these strikes being \$2,291,086.85, to which should be added \$139,846.26 given by unions for financial assistance to other unions. As a result of demands, 215,019 persons secured improved conditions; 897 strikes were won, 120 were compromised, 86 were lost, and 314 were pending at the close of the year.

In the report of the executive council much attention was devoted to the war, satisfaction being expressed at the representation which labor has been accorded on Government boards. Commenting upon the benefits to labor derived through agreements with the Government, which are set forth at length, the council said:

It is with great gratification we report specific developments showing that the American labor movement has secured the best agreements with the Government that have been secured in any other warring countries. The agreements and the relations between the workers and the American Government established a new period in the industrial world—a period in which the Government has sanctioned standards based upon principles of human welfare and has substituted these standards for the old system under which profits were paramount.

Further continuing its discussion of the war and its relation to labor the council urged the adoption of the following declarations as the basis upon which peace must be negotiated:

1. The combination of the free peoples of the world in a common covenant for genuine and practical cooperation to secure justice and therefore peace in relations between nations.

2. Governments derive their just power from the consent of the governed.

3. No political or economic restrictions meant to benefit some nations and to cripple or embarrass others.

4. No indemnities or reprisals based upon vindictive purposes or deliberate desire to injure, but to right manifest wrongs.

5. Recognition of the rights of small nations and of the principle "No people must be forced under sovereignty under which it does not wish to live."

6. No territorial changes or adjustment of power except in furtherance of the welfare of the peoples affected and in furtherance of world peace.

In addition to these basic principles which are based upon declarations of our President of these United States, there should be incorporated in the treaty that shall constitute the guide of nations in the new period and conditions into which we enter at the close of the war the following declarations, fundamental to the best interests of all nations and of vital importance to wage earners:

1. No article or commodity shall be shipped or delivered in international commerce in the production of which children under the age of 16 have been employed or permitted to work.
2. It shall be declared that the basic workday in industry and commerce shall not exceed eight hours.
3. Involuntary servitude shall not exist except as a punishment for crime whereof the party shall have been duly convicted.
4. Establishment of trial by jury.

An extended account of the visit of the British labor commission to this country is included in the report of the council, which also devoted considerable space to mention of the organization of the American Alliance for Labor and Democracy. This subject was discussed in its various phases during an entire session on the seventh day of the convention, and following the debate that portion of the council's report recommending full indorsement of "the patriotic work which has been undertaken" by that organization was adopted by a vote of 21,602 to 402, being the only occasion on which there was a line up by vote on a war question. Some of the other matters touched upon in the executive council's report were labor legislation, compulsory arbitration laws, the eight-hour day, high cost of living, the President's commission to investigate labor conditions on the Pacific coast and in the Mountain region, distribution of labor, and women in industry.

The President of the United States addressed the federation at the opening session. In his remarks President Wilson dwelt upon labor's relation to the great struggle, suggesting that the duty of all Americans is to "stand together night and day until the job is finished." In part, the President said:

If we are true friends of freedom of our own or anybody else's, we will see that the power of this country and the productivity of this country is raised to its absolute maximum, and that absolutely nobody is allowed to stand in the way of it. When I say that nobody is allowed to stand in the way I do not mean that they shall be prevented by the power of the Government, but by the power of the American spirit. Our duty, if we are to do this great thing and show America to be what we believe her to be—the greatest hope and energy of the world—is to stand together night and day until the job is finished.

While we are fighting for freedom, we must see among other things that labor is free, and that means a number of interesting things. It means not only that we must do what we have declared our purpose to do, see that the conditions of labor are not rendered more onerous by the war, but also that we shall see to it that the instrumentalities by which the conditions of labor are improved are not blocked or checked.

Nobody has a right to stop the processes of labor until all the methods of conciliation and settlement have been exhausted. And I might as well say right here that I am not talking to you alone. You sometimes stop the courses of labor, but there are others who do the same; and I believe that I am speaking

from my own experience not only but from the experience of others when I say that you are reasonable in a larger number of cases than the capitalists.

Moreover, a settlement is always hard to avoid when the parties can be brought face to face. I can differ from a man much more radically when he is not in the room than I can when he is in the room, because then the awkward thing is he can come back at me and answer what I say. It is always dangerous for a man to have the floor entirely to himself. Therefore, we must insist in every instance that the parties come into each other's presence and there discuss the issues between them and not separately in places which have no communication with each other.

Fraternal delegates from the British Trades Union Congress, John Hill and Arthur Hayday, and fraternal delegate William Lodge, from the Canadian Trades and Labor Congress, made addresses which were confined largely to war conditions among working classes of their respective countries. Maj. R. Réquin, member of the French general staff, and François Monod, chief of cabinet to the French High Commission in the United States, also spoke to the delegates, each dwelling upon the democratic organization of the French Army and the tendency toward democracy throughout French State organizations generally.

At the opening of the congress a telegram from Hon. W. B. Wilson, Secretary of the United States Department of Labor, was read as follows:

I regret that the pressure of public business prevents my being present at the Buffalo convention of the American Federation of Labor. Please permit me to express my highest appreciation and warmest thanks for the splendid work you have been and are doing for your country and the toiling masses in the hour of our Nation's need. As you know, I have been a trade unionist for nearly half a century. I have been in the heat of the struggle during all of that time and I thank God we have a country where we can struggle within the limitations and rules laid down by laws of our own making for our own guidance. In other countries they have not that privilege. And if the power of the kaiser is imposed upon us, those of us who have struggled during all these years will have lost that which we struggled for, and lost far more than that, the privilege of struggling in a legitimate and honest way. To me the one prime necessity is to lay aside our family quarrels until we have disposed of the enemy from without.

Convey to the convention my best wishes and my profound faith that its action at this time will demonstrate to the world that labor is awake to the necessity of preserving institutions which will enable it to work out its own destiny.

About 180 resolutions were offered, many referring to matters of organization, of "jurisdiction" between unions, of grievances, and of conditions of employment. A special committee was appointed by the convention to report upon the alleged scarcity of labor throughout the country. This committee's report, containing substances of reports from more than 100 central labor unions and international trade-unions, together with testimony from other sources,

was to the effect that there is an enormous reservoir of unemployed or partially employed labor in the country taken as a whole, while in certain localities and especially in certain war services there is more or less of a shortage.

Space can not be devoted to a summary or even mention of all the resolutions adopted by the convention, but reference to the subject matter of a few of the more important seems justified:

Resolutions Nos. 23 and 133 recommend pensions for public-school teachers in the District of Columbia.

Resolution No. 38 calls attention to "the reactionary attitude" of the Washington State Supreme Court in rendering a decision which it was declared amounted to a direction to all lower courts to enjoin all strikers who engage in picketing, peaceful or otherwise, singly or in groups, and which subjects all union members to liability for damages. In this connection the convention reaffirmed the following declaration made a year ago:

That any injunction dealing with the relationship of employer and employee, and based upon the dictum "labor is property," be held and absolutely treated as usurpation, and disregarded, let the consequences be what they may.

Resolutions Nos. 41 and 53 call for increases of wages of Government employees.

Resolution No. 48 calls for a reduction in nightwork in the Postal Service, and resolution No. 51 calls for "an equitable retirement law for superannuated Government employees."

Resolution No. 50 provides for organizing the Mexican workers in the United States.

Resolution No. 55 asks Congress to provide for the retention of the civil-service status of officers of unions affiliated with the American Federation of Labor and their reinstatement in the service in the same position and at the same salary as they enjoyed when they left the Government service. The resolution was referred to the president of the American Federation of Labor for such action as seems to be appropriate to carry out its purpose.

Resolution No. 59 opposes the employment of children under 16 years of age.

Resolution No. 60 would bring all railroad employees under the provisions of the Adamson law.

Resolution No. 69 calls for abolition of private employment bureaus and the employment of labor through a national free employment bureau of the Department of Labor.¹ This was referred to the executive council with instructions to submit a report at the next conven-

¹ The creation of such a bureau is recommended in the report of the Secretary of Labor, noted on pp. 40 to 47.

tion, recommending how the purpose of the resolution may be effectuated.

Resolution No. 90 calls for a bill providing a 48-hour week for women and minors employed on products which enter into interstate commerce.

Resolution No. 113 demands the right of employees to a hearing and an appeal from the judgment of officials in cases involving demotion or dismissal.

Resolution No. 122 calls for the appointment of experienced women organizers for the purpose of bringing into the unions the women called to war work. This matter was referred to the executive council for appropriate action.

Resolution No. 128 favors home rule in the District of Columbia.

Resolution No. 140 favors the introduction in Congress of a bill establishing Government ownership of the street railways of the District of Columbia.

Resolution No. 141 reaffirms the federation's "consistent stand in favor of woman suffrage," and demands "that Congress * * * shall submit to the States the Federal woman suffrage amendment."

Resolution No. 144 places the federation "on record as being in favor of legislation or the entering into of treaties with our allies that will compel these aliens to bear arms in defense of our country, or to join the forces of their own country, or to be deported from our country."

Resolution No. 154, relating to the training of men for emergency war service, agreements as to their wages and hours, and to an emergency labor supply commission connected with the Department of Labor, was adopted upon approval by the committee on resolutions, which recommended that the matter be referred to the executive council with instruction to cooperate with the presidents of affiliated organizations in working out such problems, relative to the distribution of labor to be employed upon war material, as will arise, and confer with the Government in connection with the development of the national employment bureau.

Resolution No. 157 demands the amendment of the naturalization laws so that foreign-born loyal residents who have entered our Army or Navy shall be granted full citizenship.

Resolution No. 165 approves the resolution pending in Congress prohibiting the United States Supreme Court from declaring unconstitutional laws passed by Congress.

Resolution No. 173 protests against any proposed attempt to import Chinese coolies to work as farm hands or otherwise in America.

The committee on resolutions reported in favor of the daylight saving movement, and the convention approved.

The convention restated the federation's position with regard to vocational and prevocational training which "shall be for educational purposes only, and under no circumstances shall it be commercialized through the manufacture of products for sale."

The following is the text of resolution No. 175 adopted at the close of the convention:

Resolved, That we, the delegates to this thirty-seventh annual convention of the American Federation of Labor, herewith and hereby convey to the Hon. Woodrow Wilson, President of the United States, our profound appreciation of his presence upon the opening day of the convention and for the direct frankness with which he addressed us.

Resolved, That there is particular gratification in the fact that the first President of the United States to honor and inspire by his presence a convention of the American Federation of Labor should be so staunch a defender and so able an interpreter of the fundamental principles of practical democracy.

Resolved, That after sober, serious-minded consideration of the industrial problems arising as the result of our country's participation in the war for human rights and the perpetuation of democratic institutions, we pledge to him our undivided support in carrying the war to a successful conclusion, in supporting him in his efforts to apply the principles of democracy to the solution of the problems which arise in industry, and in conducting the war so that it shall be a war of the people, continued in defense of the fundamental institutions for human liberty transmitted to us by the forefathers of our country.

The committee on international relations submitted an extended report. One of its declarations was:

We concur in the action of the executive council in refusing to be led into a premature peace conference, whether emanating from Germany or originating with her sympathizers here or elsewhere, and congratulate them upon their sagacious judgment in refusing to participate or become involved in any schemes of this character.

The members of the executive council of the federation were re-elected, with one exception. Daniel J. Tobin was elected treasurer to succeed John B. Lennon.

President.....	Samuel Gompers.
First vice president.....	James Duncan.
Second vice president.....	James O'Connell
Third vice president.....	Joseph F. Valentine.
Fourth vice president.....	John R. Alpine.
Fifth vice president.....	H. B. Perham.
Sixth vice president.....	Frank Duffy.
Seventh vice president.....	William Green.
Eighth vice president.....	W. D. Mahon.
Treasurer.....	Daniel J. Tobin.
Secretary.....	Frank Morrison.

The next convention will be held at St. Paul, Minn., beginning the second Monday in June, 1918.

**UNIONIZING EMPLOYEES UNDER CONTRACT DECLARED ILLEGAL
BY UNITED STATES SUPREME COURT.**

An important decision of the Supreme Court, rendered December 10, 1917, brings to an end a protracted discussion as to the rights of union organizers to carry on their work among workmen under contract to maintain nonunion conditions. The net effect appears to be that outside parties, whether or not they be organizers of labor unions, may be prevented from interfering with a contract of employment under which the employees have agreed not to join a union during the service, and the employer has agreed that the establishment shall be maintained as an open shop; and this although the contract of employment is not for a definite term, but at will. The case (*Hitchman Coal & Coke Co. v. Mitchell et al.*) arose out of conditions and occurrences in the coal mines of West Virginia, and has been in the courts since 1907, when a temporary restraining order was granted on the petition of the company, this order to be in force until the next regular term of court in January, 1908. After some postponements the defendants announced that they "did not desire to be heard in opposition to said motion so far as the granting of a temporary injunction at the time was concerned, and not consenting, but objecting thereto." A temporary injunction was thereupon immediately granted in the terms of the restraining order, and the next step was a motion on the part of the defendants to dissolve the injunction in so far as it restrained them, or any of them, from the use of argument, reason, and persuasion to induce the employees of the plaintiff company, or any of them, to become members of the United Mine Workers of America, or any of its subordinate branches; also in so far as it restrained them from interfering with or talking to employees or prospective employees, to secure their membership, in a peaceable and law-abiding manner, without intimidation, force, threat, violence, or coercion. Other points objected to were the prohibition against visiting the homes of plaintiff's employees or going near the premises of the plaintiff for the purpose of inducing workmen to become members of the union, and forbidding attempts at unionizing the plaintiff's mine, "if by unionizing is meant action on the part of the defendants to induce the employees of plaintiff to become members of the United Mine Workers of America by the use of argument, persuasion, and reason, unaccompanied by force, violence, coercion, or intimidation. This motion was argued on April 7, 1909, and was decided in September of the same year, Judge Dayton delivering the opinion, which is reported in 172 Federal Reporter, page 963. The injunction was continued without modification, the court pointing out that "The right of labor to organize

for mutual benefit and protection is as well settled and determined by law as the right of capital to organize for the same purpose." The solicitation of membership was also held legal as a general proposition, and the right of employees to leave service, whether individually or collectively. In the case in hand, however, it was held that the fact that there was no controversy between the plaintiff and his employees, that there was between them a contract to maintain an "open shop," and no strike was desired or threatened by them, removed this case from the field of controversy affecting the rights of members of unions. "It is not a case where the labor union has longer any legitimate interest or concern."

From this decision an appeal was taken to the circuit court of appeals, which was, however, dismissed in March, 1910, for want of jurisdiction. The case was then taken up before the district court for final hearing. A great bulk of evidence was submitted with extensive briefs, and Judge Dayton himself prepared an opinion going at great length into the history of labor organizations and the principles governing their activities. The opinion recited in detail the history of the difficulties which had attended the operation of the mine from its beginning, including the period when it was run as a closed union mine, during which time three strikes were called involving in all a loss of approximately \$50,000 and a full half year of working time. In this opinion the union was declared to be a combination in restraint of trade under the common-law doctrines of conspiracy, as well as a violation of the Sherman antitrust law, and the injunction was made perpetual (202 Fed. 512).

The case was then taken to the circuit court of appeals, where the decision of the court below was reversed and instructions were given to dismiss the suit (May, 1914, 214 Fed. 685); but this order was stayed pending an application to the Supreme Court of the United States for a writ of certiorari. The circuit court of appeals afterwards allowed an appeal, which the Supreme Court dismissed, but granted the writ of certiorari.

Mr. Justice Pitney delivered the opinion of the court, from which three justices dissented. The history of the case is given with considerable fullness, including an account of the original difficulties which led to the determination to operate the mine under nonunion conditions, with individual contracts with each employee, by which it was agreed that during his term of employment the mine should be nonunion, and that if he desired to join a union he was free to do so, though the action would amount to a termination of his contract of employment with the company. Similar agreements were made with reference to the Glendale mine, operated by the same management as the Hitchman; another mine a few miles north was

likewise run nonunion. The motives that led the United Mine Workers of America to desire especially the unionization of the mines in this so-called Panhandle district of West Virginia were developed by quotations from the minutes of the annual international convention of the U. M. W. A. held in January, 1907, at which time the method of unionizing that had been in use was approved, it being agreed that this field "would not be thoroughly organized except as the result of a successful strike." The methods of the organizer sent into the field were described, the plan being to secure agreements from individual miners that they would join the organization, the organizer at one time stating that "they had 60 men who had signed up or had agreed to join the organization at Hitchman, and that they were going to shut the mine down as soon as they got a few more men." It was known to this organizer, Hughes by name, that membership in the union was inconsistent with the terms of employment at the three mines named above, and a violation of express provisions of the contract of employment at the Hitchman and Glendale mines. Furthermore, "there is clear and uncontradicted evidence that he did not confine himself to mere persuasion, but resorted to deception and abuse." Such activities continued until it became possible to shut down the Richland mine, and it remained closed until a restraining order was allowed by the court, after which it immediately resumed operations as a nonunion mine.

In view of these facts and others cited, the court found that "if there be any practical distinction between organizing the miners and organizing the mine it has no application to this case. * * * The evidence shows, without any dispute, that defendants contemplated no halfway measures, but were bent on organizing the mine, the 'consent' of plaintiff to be procured through such a control of its employees as would render any further independent operation of the mine out of the question."

In view of the facts recited, which "are either admitted or else proved by clear and undisputed evidence and indubitable inferences therefrom," the question remained as to their legal consequences. It was first pointed out that there was no question that the plaintiff company "was acting within its legal rights in employing its men only upon terms of continuing nonmembership in the United Mine Workers of America. * * * The same liberty which enables men to form unions and through the union to enter into agreements with employers willing to agree, entitles other men to remain independent of the union and other employers to agree with them to employ no man who owes any allegiance or obligation to the union. * * * Plaintiff, having in the exercise of its undoubted rights established a working agreement between it and its employees, with the free as-

sent of the latter, is entitled to be protected in the enjoyment of the result of the status as in the enjoyment of any other legal right."

It was pointed out that the fact that the employment was at will and terminable by either party at any time was of no consequence, Mr. Justice Pitney quoting from an opinion in a somewhat earlier case, *Truax v. Raich* (239 U. S. 33), in which it was said that "the fact that employment is at the will of the parties, respectively, does not make it one at the will of others. * * * The unjustified interference of third persons is actionable, although the employment is at will."

An interesting basis for the views taken was then announced, citing various cases, among them that of *Jersey City Printing Co. v. Cassidy* (1903) (63 N. J. Eq. 759, 53 Atl. 230), in which Vice Chancellor Stevenson had adopted the term "probable expectancies" from an opinion recently delivered by Lord Ellenborough, of the House of Lords, suggesting "that the natural expectancy of employers in relation to the labor market, and the natural expectancy of merchants in respect to the merchandise market must be recognized to the same extent by courts of law and courts of equity." The language used by Mr. Justice Pitney is as follows:

In short, plaintiff was and is entitled to the good will of its employees precisely as a merchant is entitled to the good will of his customers, although they are under no obligation to continue to deal with him. The value of the relation lies in the reasonable probability that by properly treating its employees, and paying them fair wages, and avoiding reasonable grounds of complaint, it will be able to retain them in its employ, and to fill vacancies occurring from time to time by the employment of other men on the same terms. The pecuniary value of such reasonable probabilities is incalculably great, and is recognized by the law in a variety of relations. (Cases cited.)

Mr. Justice Pitney followed Judge Dayton in declaring that "The case involves no question of the rights of employees. Defendants have no agency for plaintiff's employees, nor do they assert any disagreement or grievance in their behalf. In fact, there is none; but, if there were, defendants could not, without agency, set up any rights that employees might have. The right of the latter to strike would not give to defendants the right to instigate a strike. The difference is fundamental."

Taking up then the claim of the unions to a right to a larger membership by solicitation, it was said that "The right is freely conceded, provided the objects of the union be proper and legitimate, which we assume to be true, in a general sense, with respect to the union here in question." This right was held to be subject, however, to coexisting rights of others, and as every Hitchman miner who agreed to join the union permitting his name to be entered upon the organizer's list was guilty of a breach of his contract, it was de-

terminated that the right of solicitation under such circumstances did not exist. A workman making such an agreement was said to have "acted a lie whenever he thereafter entered plaintiff's mine to work. Hughes not only connived at this, but must be deemed to have caused and procured it. * * * True, it is suggested that under the existing contract an employee was not called upon to leave plaintiff's employ until he actually joined the union, and that the evidence shows only an attempt by Hughes to induce the men to *agree* to join, but no attempt to induce them to violate their contract by failing to withdraw from plaintiff's employment after *actually joining*. But in a court of equity, which looks to the substance and essence of things and disregards matters of form and technical nicety, it is sufficient to say that to induce men to agree to join is but a mode of inducing them to join."

That the object in unionizing the men was not to enlarge the membership of the union so much as to secure the organization of the mines was maintained, since "without this, the new members would be added to the number of men competing for jobs in the organized districts, while nonunion men would take their places in the Panhandle mines. * * * In any aspect of the matter, it can not be said that defendants were pursuing their object by lawful means. The question of their intentions—of their bona fides—can not be ignored. It enters into the question of malice. * * * And we can not deem the proffered excuse to be a 'just cause or excuse,' where it is based, as in this case, upon an assertion of conflicting rights that are sought to be attained by unfair methods, and for the very purpose of interfering with plaintiff's rights, of which defendants have full notice. Another fundamental error in defendants' position consists in the assumption that all measures that may be resorted to are lawful if they are 'peaceable'—that is, if they stop short of physical violence, or coercion through fear of it. In our opinion, any violation of plaintiff's legal rights contrived by defendants for the purpose of inflicting damage, or having that as its necessary effect, is as plainly inhibited by the law as if it involved a breach of the peace. A combination to procure concerted breaches of contract by plaintiff's employees constitutes such a violation."

It was further said that if a strike should be called and a complete new gang of men required "there might be a reasonable apprehension of violence at the hands of the strikers and their sympathizers. The disordered condition of a mining town in time of strike is matter of common knowledge. It was this kind of intimidation, as well as that resulting from the large organized membership of the union, that defendants sought to exert upon plaintiff. * * * Upon all the facts, we are constrained to hold that the purpose entertained by de-

defendants to bring about a strike at plaintiff's mine in order to compel plaintiff, through fear of financial loss, to consent to the unionization of the mine as the lesser evil, was an unlawful purpose, and that the methods resorted to by Hughes—the inducing of employees to unite with the union in an effort to subvert the system of employment at the mine by concerted breaches of the contracts of employment known to be in force there, not to mention misrepresentation, deceptive statements, and threats of pecuniary loss communicated by Hughes to the men—were unlawful and malicious methods, and not to be justified as a fair exercise of the right to increase the membership of the union.”

It was held, therefore, that the plaintiff was entitled to relief by injunction as to the defendants who answered, while as to others named as defendants, but not served with process, the decree of the district court was held to be erroneous. The injunction as issued by Judge Dayton was sustained in so far as it restrains interfering or attempting to interfere with the company's employees for the purpose of unionizing the mine without its consent, or restrains the knowing and willful bringing about of the breaking of contracts by the plaintiff's employees, the trespassing on the grounds or premises of the plaintiff for the purpose of interfering therewith or hindering or obstructing its business, “or with the purpose of compelling or inducing, by threats, intimidation, violent or abusive language, or persuasion, any of plaintiff's employees to refuse or fail to perform their duties as such.” Similar interference with prospective employees was also restrained, except as to the use of the word “persuasion.”

Inasmuch as there was no evidence of picketing or acts of physical violence, an injunction against these forms of interference was held not to be warranted, and these were directed to be eliminated from the injunction, unless proof should be offered to the effect that their inclusion was warranted.

A dissenting opinion prepared by Mr. Justice Brandeis was concurred in by Mr. Justice Holmes and Mr. Justice Clarke. Much of the evidence adduced in the final hearing before the district court and reviewed in the opinion of the Supreme Court was declared not to be admissible, on the ground that there was no foundation for the conspiracy charged, though the majority opinion recited it as indicating the cooperation of the various agencies and the purpose of the specific activities engaged in. In his opinion Mr. Justice Brandeis took up some points in the opinion of Judge Dayton which were not touched upon in the majority opinion, as the alleged illegality of the United Mine Workers of America under the law of West Vir-

ginia and under the Federal antitrust act. He then reached the conclusion that there was no conspiracy proved against the West Virginia mines, nor was there any undertaking to unionize the plaintiff's mine without its consent, citing the testimony of a witness that "Under the constitution and methods of the United Mine Workers, a mine can not be organized without its consent, and it is not the object or purpose of the United Mine Workers to do so, and never has been." It was also maintained that there was no attempt to induce employees to violate their contracts, and that an agreement on the part of the employee to join the union did not call upon him to leave the plaintiff's employ. He also maintained that "merely persuading employees to leave the plaintiff's employ or not to enter it was not unlawful," and further that there was no "threat, violence, or intimidation."

When this suit was filed no right of the plaintiff had been infringed and there was no reasonable ground to believe that any of its rights would be interfered with; and, in my opinion, the circuit court of appeals properly reversed the decree of the district court, and directed that the bill be dismissed.

Another opinion which was delivered on the same day involved very similar principles, the plaintiff being the Eagle Glass & Manufacturing Co., in court for the purpose of the maintenance of an injunction granted against the American Plate Glass Workers' Union and its officers and members to prevent attempts to unionize its factories. The same court of appeals had passed upon this case as passed upon the Hitchman case, and it directed the dissolution of a temporary injunction that had been issued, and the dismissal of the bill, saying that "All the questions involved in the merits of the appeal were decided adversely to the appellee by this court in *Mitchell v. Hitchman Coal & Coke Co.* (214 Fed. 685)." For the same reasons as given in the Hitchman case, Justice Pitney ruled that the plaintiff was entitled to be protected by law from interference with the good-will of its employees, that outside parties were not interested and had no right to instigate a strike, and that the methods used were not lawful. The use of money by the organizer and threats to use dynamite were differences in circumstances, but otherwise the cases were practically identical. The decision of the court of appeals dissolving the temporary injunction was affirmed, on the ground of insufficient evidence to sustain the charges of the plaintiff, but in so far as a dismissal of the appeal had been directed, that decision was reversed, and the case remanded to the district court for further proceedings in conformity with the opinion of the Supreme Court. Here, also, Mr. Justice Brandeis dissented, Justices Holmes and Clarke joining in the dissent, the reasons being the same as those stated in the Hitchman case.

TRADE-UNIONS IN THE GOVERNMENT SERVICE.

The annual report of the Postmaster General for the fiscal year 1917 discusses at considerable length the history and policy of permitting organization of postal employees. He characterizes many of the grievances of organized postal employees as "imaginary," and declares that the service—citing a special instance—suffers generally from "too much unionism." The activities of postal employees in attempting to influence legislation in their behalf, he states, have resulted in embarrassment to the department. He reviews the history of the order of 1895 which attempted to prohibit, under penalty of dismissal, postal employees from visiting Washington for the purpose of influencing legislation; and of the later order of 1902, issued by President Roosevelt, forbidding all officers or employees of the United States, individually or through associations, to solicit an increase of pay, or to influence in any way matters of legislation. He favors the repeal of the provision of the act of August 24, 1912, which removed the above disabilities and permits postal employees to organize in so far as such organizations do not obligate their members to engage or assist in a strike against the United States. These organizations, he concludes, "are fast becoming a menace to public welfare and should no longer be tolerated."

The Postmaster General, on the other hand, recognizes the necessity for employees in private industries "to protect themselves against the selfishness of private employers;" but in the Government service the conditions are different, he contends. "The relations between the employee and the Government are always matters of public information, and the interests of the employee will always be protected by public sentiment. * * * [Employees] can always depend upon public opinion to insure their enjoyment of their full rights under their employment."

The following is quoted at length from the report in question:

The need for this cooperation was never greater than at the present time, when the Nation is engaged in a world war to maintain the right of liberty and self-government. The success of this war will depend, to a large extent, upon the closest cooperation. All kinds of business and of labor will be severely taxed, and each must make its own sacrifices. It will be necessary for the Nation to furnish its quota of men, and for capital and labor to produce, and to produce quickly, the funds, material, and services necessary for the successful conduct of the war. Great sacrifices will be required, not only of those who go to the front but of capital and of labor as well, and necessarily the interests of the individual must for the time being be subordinated to those of our country. Normal working conditions can not prevail, and the war can not be won nor the world rebuilt under normal conditions. Notwithstanding this fact, and at this critical period in our Nation's history,

it is regrettable to state that the organized postal employees are making many selfish demands and insisting that they shall not be required or permitted to work in excess of the usual number of hours; also that their salaries be permanently increased, although they are justly compensated, receiving more than three times as much as those fighting in the trenches, who must of necessity suffer the hardships of warfare and sacrifice their all if necessary.

Efforts of these organizations along other lines have been severely criticised by men in public life, as they attempt to control political as well as legislative matters and openly boast of the influence they claim to exert in the furtherance of their selfish interests.

An outside organization has during the past several years attempted to unionize Government employees, including those in the Postal Service, and a large number of postal employees are now affiliated with it, and others soon will be, notwithstanding the fact that such affiliation is believed to be contrary to the act of August 24, 1912. The advisability of permitting Government employees to affiliate with an outside organization and use the strike and boycott as a last resort to enforce their demands is seriously questioned by those interested in the public welfare.

Such a policy, however, does not gainsay the propriety of permitting organization for the social benefit of postal employees. The Secretary continues in the following vein:

They should be permitted to form organizations for their social and mutual welfare, appear before committees of Congress when requested, and give any information concerning the Postal Service of which they may have knowledge; but the forming of organizations for other purposes, such as interfering with the discipline and administration of the service, and the control of the election of persons nominated for public office, or enactment of legislation for their selfish interests and not for the welfare of the public, should cease. If by combining Government employees are enabled to unduly influence Members of Congress and others seeking election to public office, the situation will naturally arise, if it has not already arisen, where Congress will be unduly influenced by such combinations, the appropriations for the salaries of such employees will be greatly increased, and economic provision for the conduct of the service impossible. The conduct of these organizations at this time is incompatible with the principles of civil service and with good administration of the Postal Service. They are fast becoming a menace to public welfare and should no longer be tolerated or condoned.

LOSS OF MEMBERSHIP OF AUSTRIAN TRADE-UNIONS DURING THE WAR.¹

The following statistics illustrate the effect of mobilization upon the membership of Austrian trade-unions. They are reproduced by Vorwärts of September 5 from the report of the Central Federation of Austrian Social-Democratic Trade-Unions for 1916.

¹ The Labour Gazette, London, November, 1917, p. 403.

Year.	Membership at end of year.		
	Males.	Females.	Total.
1913.....	372,216	42,979	415,195
1914.....	210,421	30,260	240,681
1915.....	151,424	25,689	177,113
1916.....	138,789	28,148	166,937

The loss in membership between 1913 and 1916, taking both sexes together, has been continuous throughout the period covered by these figures, and by the end of 1916 amounted to 248,258, or 60 per cent. The number of male members during the same period declined by 233,427, or 63 per cent, principally owing to men being called up for military service.

By the end of 1915 the number of unionists called up was about 200,000. Since then the extension of military age (in 1916) from 42 to 50 has caused the loss of several thousand members, while the constant enrollment of younger men and the comparatively few discharges from the army have also combined to reduce the membership. The writer in *Vorwärts* expresses the opinion that the number of men called to the colors far exceeds the loss of membership.

WORKMEN'S COMPENSATION AND SOLDIERS' PENSIONS.

FIRST ANNUAL REPORT OF UNITED STATES EMPLOYEES' COMPENSATION COMMISSION.

On September 7, 1916, Congress enacted a law providing compensation for all civil employees of the United States suffering injuries while in the performance of their duties. This law superseded the limited workmen's compensation act of 1908 and its subsequent amendments. An Employees' Compensation Commission was also created to administer the new law, except that the administration of the act was transferred to the Governor of the Panama Canal and to the Alaska Engineering Commission as regards employees under their respective jurisdictions.

The commission has just issued its first annual report reviewing the operation of the law from the date of its enactment (Sept. 7, 1916) to June 30, 1917.

PROVISIONS OF THE ACT.

The Federal act provides compensation for all personal injuries causing death or resulting in disability of more than three days and covers all civil employees of the United States. The compensation scale is $66\frac{2}{3}$ per cent of wages, the maximum wage, for the purpose of computing compensation, being limited to \$100 a month. Payments continue during disability and in fatal cases until the death or remarriage of the widow. Reasonable medical and hospital services are furnished in addition to compensation benefits. Such services are provided by the United States medical officers and hospitals wherever practicable. The burden of payment is borne by the Federal Government through a special compensation fund appropriated by Congress.

COMPENSATION COSTS.

The amount paid out in compensation benefits and medical services during the period covered by the report was as follows: United States Employees' Compensation Commission, \$122,806.07; Panama Canal, \$29,806.73; Alaska Engineering Commission, \$7,317.31; total, \$159,930.11. The amount paid out by the United States Employees' Compensation Commission, however, does not show the total losses

incurred during this period. It covers only those cases which had been approved by the commission at the close of the period and includes only two of the 121 fatal cases reported.

INJURIES REPORTED.

The injuries reported to the commission during the period September 7, 1916, to June 30, 1917, numbered 7,832, of which 121 were deaths, 5,697 resulted in disability of over three days, 718 resulted in disability of from one to three days, while the remainder include those in which no time was lost except on the day of injury and those in which the particulars received were not sufficiently complete for tabulation.

The following table shows the tabulatable injuries for each department and establishment classified by extent of disability:

NUMBER OF INJURIES BY EXTENT OF DISABILITY FOR EACH DEPARTMENT OR ESTABLISHMENT, SEPT. 7, 1916, TO JUNE 30, 1917.

Department or establishment.	Total inju- ries.	Number of injuries resulting in—					
		Death.	Temporary disability of—				
			Over 1 to 3 days.	Over 3 to 7 days.	Over 7 to 14 days.	Over 14 to 28 days.	Over 28 days.
Agriculture.....	105	5	18	20	21	21	18
Commerce.....	110	14	12	24	21	19	20
Interior.....	229	9	22	28	58	62	50
Justice.....							
Labor.....	15		2	3	3	2	5
Navy.....	2,805	20	195	650	671	763	506
Post Office.....	1,289	24	108	203	282	275	397
State.....	1						1
Treasury.....	222	4	60	53	32	37	36
War.....	1,704	43	299	385	316	363	298
Government Printing Office.....	57	1	2	14	18	10	12
Other.....	1	1					
Total, all departments.....	16,536	121	718	1,380	1,422	1,552	1,343
Panama Canal.....	1,209	31	397	279	213	167	122

¹ This total does not agree with the sum of the items shown.

² Including 5 cases of permanent partial disability.

The commission has ruled that occupational diseases as well as accidents are compensable under the Federal law. In view of this fact it is of interest to note that of 6,760 injuries tabulated as to nature of injury nearly 60 were of this character. This number included 23 cases of lead poisoning, 2 of which were fatal; 16 cases of dermatitis and conjunctivitis from fulminate of mercury; 2 cases of brass poisoning; 2 cases of acid poisoning from acid fumes; 2 cases of creosote poisoning; and single cases of dermatitis from acid, and from benzine irritation, bronchitis and laryngitis from acid fumes, dermatitis from cement water, eczema of the hands from potassium

bichromate, temporary paralysis of the right arm from use of the pneumatic hammer, zinc poisoning from fumes given off in welding galvanized iron, and typhoid fever from handling typhoid bacilli in making vaccine.

ACCIDENT PREVENTION.

The law makes no specific provision for accident-prevention work. The commission, however, has recommended that the act be amended to provide for such prevention work and for the appointment of a safety expert. At the outset the commission recognized the necessity of having knowledge of the conditions under which the work in Government establishments was carried on. As the best means to this end the commission accepted the services of the National Safety Council and of the National Museum of Safety for a safety survey of the various Government establishments with the cooperation of the various Government departments and an advisory committee representing them. As a result of this survey safety engineers for all the important navy yards and arsenals have been appointed by the Secretaries of the Navy and of War.

COST OF COMPENSATION DURING 1915-16.

The cost of compensation for the injuries occurring during the period of July 1, 1915, to September 6, 1917, under the act of May 30, 1908, and its amendments, as administered by the Department of Labor and later by the Employees' Compensation Commission, was \$518,017.46, paid on account of 3,859 injuries.

The following table shows the number of injuries reported, number of claims paid, and amount of compensation paid, by departments, during this period:

NUMBER OF INJURIES REPORTED AND NUMBER AND AMOUNT OF CLAIMS PAID ON ACCOUNT OF INJURIES OCCURRING DURING PERIOD JULY 1, 1915, TO SEPT. 6, 1917.

Department or establishment.	Number of injuries reported.	Number of claims paid.	Amount of compensation paid.
Agriculture.....	268	104	\$24, 184. 16
Commerce.....	163	73	17, 681. 07
Interior.....	455	207	32, 051. 41
Justice.....			
Labor.....	14		
Navy.....	3, 295	2, 089	265, 874. 11
Post Office.....	1, 504	14	199. 10
State.....			
Treasury.....	326	106	20, 932. 51
War.....	2, 395	1, 220	151, 576. 59
Government Printing Office.....	86	55	5, 468. 51
Miscellaneous.....	3	1	50. 00
Total.....	8, 509	3, 859	1 518, 017. 46

¹ Does not include compensation paid to employees of Panama Canal (\$67,036.92) and to employees of Post Office Department (\$134,500 appropriated) for fiscal year ending June 30, 1916.

The figures showing number of claims approved are not in agreement in several tables of the report, and other errors of detail are apparent. These discrepancies are in part explainable as clerical or typographical errors which were not discovered in the proof reading; in other instances they can not be so explained.

MILITARY PENSION SYSTEMS IN THE UNITED STATES AND FOREIGN COUNTRIES.

The entrance of the United States into the war immediately brought into relief the inadequacy of our military pension system and the necessity of supplementing existing legislation with a compensation and insurance system adequate to provide for our disabled military forces and take care of their dependents during their period of service. The existing pension laws in the United States were confessedly inadequate to meet the situation developed by the war, and the urgent need for such legislation made an extensive investigation of the systems adopted in foreign countries impossible. To meet the immediate demand for information a compilation and analysis of the pension and insurance laws in operation in some of the more important countries¹ was prepared and published by the Children's Bureau² of the United States Department of Labor.

This report briefly summarizes the military pension systems in effect in the several countries and includes the governmental provisions relating to military pay, separation allowances, disability pensions, survivors' or dependents' pensions, retirement and service pensions, insurance, special relief measures, and methods of administration. Each country is treated separately and the various pension schedules of each nation are reproduced with brief descriptions and connotations. Comparative schedules, however, of the several more important provisions have been collated.

Three types of pension laws, says the report, were in existence in the United States at the time of our entrance into the war.³

A. The retirement systems of the Army, Navy, Marine Corps, and Coast Guard provide, with certain marked limitations, for officers

¹ United States, Australia, Austria, France, Germany, Great Britain, Italy, Netherlands, New Zealand, Russia, South Africa, and Switzerland.

² United States Department of Labor, Children's Bureau. Governmental provisions in the United States and foreign countries for members of the military forces and their dependents (bureau publication No. 28), 1917, 237 pp.

³ Since then Congress has enacted a new military compensation and insurance law (Oct. 6, 1917) to meet the situation developed by the war. This law, in providing for separation allowances, compensation in case of disability or death, and in offering Government insurance opportunities, marks a notable departure from the former pension policy of the Government. For a brief summary and text of the new law (Public, No. 90) see MONTHLY REVIEW for November, 1917, pp. 183 to 199.

and men of the regular establishment. Except in the Coast Guard, no allowance is made for an enlisted man who has served less than 30 years.

B. The general pension laws administered by the Pension Bureau of the Department of the Interior, which provide for military and naval officers disabled in the Federal service who are not a part of the regular establishment and, therefore, not eligible for retirement, for enlisted men who are disabled in the Federal service, and for the dependents of officers and enlisted men who are killed in the Federal service, except that widows of officers and enlisted men in the Coast Guard are not eligible for pension.

C. The service-pension laws, also administered by the Pension Bureau, which provide for men who had served in specified wars for specific periods, and for their widows and children, without reference to any disability incurred in the service or to the cause of the death.

A comparison of these American laws with the provisions for soldiers' dependents in certain European countries and British dominions, says the report, reveals various tendencies or types of provision with which American laws have not hitherto been concerned. These tendencies are summarized in the report as follows:¹

Possibly the most striking difference from American laws is the almost universal provision for separation allowances paid to the families of men on active service. In Great Britain and the British colonies and in Russia an allowance is paid to the wife and children of every enlisted man; in many cases this varies according to the size of the family. Elsewhere such an allowance is granted only in case of need or, as in Holland, the amount is graded not by the size of the family but by its economic status. In addition, Great Britain and the British colonies require allotment to the wife of part of the pay of the enlisted man. Alone among the belligerent countries studied the United States is making no allowance whatever for the families of men in active service; the United States permits but does not require an allotment of pay.²

The amounts of the separation allowances vary widely. In Germany, for example, the stated allowance is frankly a minimum, which may be increased for each community at the discretion of the local distributive agencies. In fact, it is frequently supplemented from State or municipal funds. Germany also grades the amount of the income which a family may possess without forfeiting separation allowance according to the type of community in which the family lives. Russia gives the case equivalent or specified food staples and their cash value is determined for each Province separately. Practically every country has increased the amount of its allowances since the outbreak of the war. * * *

Both France and Germany have since the war extended to all wives who are receiving separation allowances the maternity benefits already provided in the German system of social insurance and in France the maternity benefit law of

¹ Pages 26 to 33.

² The new military pension act of Oct. 6, 1917, makes provision for separation allowances, and also requires an allotment of pay.

1913. In Great Britain a new provision of the national insurance act requires that every man who joins the army or navy be insured and his premiums deducted from his pay. His wife then becomes eligible for a maternity benefit of 30 shillings (\$7.30) for each confinement. In other ways also new efforts are everywhere evident to adapt the allowances and pensions to the actual needs of the situation. For example, the illegitimate child who has been acknowledged by the father is now almost everywhere entitled to benefits, and Great Britain gives the unmarried wife a separation allowance in certain circumstances, provided the man chooses to allot his pay to her. In Germany the unmarried woman is entitled to a maternity benefit if she has already an illegitimate child on whose behalf she is drawing an allowance.

England has recently provided that special allowances may be paid to enable men to meet financial obligations contracted before they entered the service for the following purposes: To buy furniture or real property, to pay rent or taxes, to meet payments on loans or mortgages, or to pay for children's schooling. The need for financial assistance must be proved and the amount paid by the State can not exceed £104 (\$506.12) per annum.

Several countries permit the pension for a partially disabled man or for the widow of a man killed in service to be commuted into a lump-sum payment, provided the pensioner can satisfy the authorities that this will better serve his needs. Great Britain, again, and certain of the colonies, make substantial variations in the pensions allowed for total disability according to the number of the man's dependents.

Practically all countries vary their disability pensions and pensions to widows and other dependents of men killed in service according to the military rank of the man. Switzerland, on the other hand, has related her military compensation to her civil insurance scheme and bases the allowances for disability and death on the man's civil earnings up to specified maxima. England allows a disabled man or a widow to receive, under certain conditions, a pension based not on disability but on prewar income. If the enlisted man can prove, for example, that the disability pension, including the additional allowance for children, and his present average earnings amount to less than his prewar earnings, he may be granted a pension which, together with his average earnings, will equal but not exceed his prewar earnings up to a maximum of 50 shillings (\$12.17) a week, and half of any prewar earnings between 50 and 100 shillings (\$12.17 and \$24.33) a week.

The new pension law in Italy and the proposed law in France include detailed categories of injuries which aim to measure the extent of disability not in terms of military usefulness but in terms of civil usefulness and earning power. Fine adjustments of the relation of the injury to the individual's occupation have not been attempted even in Germany. And nowhere are the pensions granted to a disabled man lowered or withdrawn if he is able to increase his earning power by special training.

Various methods have been devised to provide for a disabled man and his dependents during his reeducation. In Canada the disabled man can be re-enlisted for industrial training, and during the period of training his family receives allotted pay and separation allowances. Great Britain and Italy enforce plans for reeducation by withholding their part of the pension from a man who refuses to undergo treatment or training certified as necessary for his interest.

The ages up to which children are eligible to pensions or separation allowances vary from 12 years for separation allowances in Italy to 21 years in Great

Britain for pensions to children of soldiers or sailors if they are attending school or receiving technical training. Austria regards as the "normal age" at which allowances and pensions are withdrawn 16 years for boys and 14 years for girls. Germany grants separation allowances only until 15 but pensions until 18 years of age. The new Italian law gives pensions also until 18.

In general, parents or brothers and sisters, are eligible for benefits only in the absence of both widow and children, and only if the parents or brothers and sisters were dependent upon the deceased. Italy's new law includes a generous definition of this dependency and Great Britain has added to the dependency provision the alternative that the deceased son or brother was apprenticed at a recognized trade or receiving training at school or artficed for a profession.

The report does not, except in case of the United States, show the number of pensioners in each country nor does it cover the question of cost. Of value also in this connection would be a comparison of the military with the industrial compensation systems, supplemented with a study of the governmental provisions in each country for rehabilitating and reeducating disabled men, industrial as well as military.

OPERATION OF THE PENNSYLVANIA STATE WORKMEN'S INSURANCE FUND IN 1916.

The report of the Pennsylvania State workmen's insurance fund¹ for the year ending December 31, 1916, the first year of its operation, shows a gross income of \$885,876.27, of which \$785,006.59 represents net premiums, a deduction of \$100,869.68 being made for merit rating. It is estimated that the premium income during 1917 will amount to \$1,250,000. The expenses of the fund, which are paid by the State until July 1, 1919, were, in 1916, \$138,125.24, or 17.6 per cent of the annual premium income.

If this 17.6 per cent ratio had been calculated on the 100 per cent rate basis charged by the casualty companies instead of on a premium income 10 per cent less, for the same business, the annual expense ratio would have been 15.8 per cent. The expense cost is lower than shown by any other compensation insurance carrier operating in Pennsylvania.²

According to the report the claim cost, including the setting up of reserves to carry claims to maturity based on estimates set forth by the Pennsylvania insurance department, produces a loss ratio of 69.4 per cent, and it is suggested that if this claim cost is computed on 100 per cent premium rates, as explained in the expense ratio, the result would be a loss ratio of 62.4 per cent, which may be compared

¹ Annual report of the State Workmen's Insurance Fund of Pennsylvania. Harrisburg, [1917]. 29 pp.

² The average expense ratio, as taken from the official records of the insurance department, was 35.8 per cent.

to 61.3 per cent given as the average loss ratio for all carriers of compensation in the State during 1916.

Taking up the matter of claims, the report states that 9,407 accident reports were received by the claims division during 1916. Of these 111 were death cases, 40 dismemberment cases, and 2,596 compensable cases other than death and dismemberment. Of the 111 death claims, 64 (58.6 per cent) involved dependency; of the 40 dismemberment cases, 26 (65 per cent) involved loss of eye. At the end of the year compensation was being paid to 12 dependent parents, 37 widows, and 92 orphan children. Reserves to carry all outstanding claims to maturity were set aside and charged against the year's income.

Owing to an increase in the number of accidents and the resulting addition in the cost for insurance, it was found that the initial rates approved by the insurance department were inadequate and on August 1, 1917, an increase of rates became effective to apply to policies written after that date.

The present rate differential of 10 per cent below casualty company rates remains in force and employers insured in the State fund also have the privilege of participating in dividends from profits. With the continuation of such advantages, even with the increase in rates, policyholders in the State fund obtain their insurance much cheaper than it can be obtained from casualty companies.

The State fund declared a dividend on the business transacted in 1916, according to the report, 10 per cent being paid to the group of coal-mine risks and 15 per cent to the group containing all other risks. The amount of this dividend was \$93,162.04.

The following statement shows the income and disbursements for 1916:

CONSTITUTIONALITY OF COMPENSATION LAW OF HAWAII.¹

A very unexpected check in the movement for the establishment of the system of compensation for industrial injuries appears in a decision by Judge Ashford of the circuit court for the first circuit of the Territory of Hawaii, this decision being rendered on June 28, 1917. The case was an action for damages brought by one Carroll against the Marconi Wireless Telegraph Co. of America, the complaint charging negligence. The company demurred to the complaint on the ground that the compensation law of the Territory (Act 221 of the Laws of 1915) swept away rights of action previously existing, and substituted a single method for the determination of all cases of this nature. The matter of constitutionality was at once brought into question, and by this court decided adversely, with considerable reference to the position taken by the Court of Appeals of New York in the Ives case (201 N. Y. 271, 94 N. E. 431).

Judge Ashford had withheld judgment until the decision rendered by the Supreme Court of the United States on March 6, 1917, upholding the constitutionality of the compensation laws of Iowa, New York, and Washington, and consideration was given to the opinions in those cases. The court concluded, however, that inasmuch as the Hawaiian statute was a compulsory law, seeking to "wipe out and utterly abolish rights of action by an employee falling

¹ After this summary of the decision declaring the law unconstitutional was put into type information was received that the decision had been reversed. See note on p. 166.

within any of the classes covered by the statute, to recover damages for injuries arising in the course of his employment," there should be such hearings as would fairly and fully compensate for the loss of the right of trial by jury—provisions which the court held to be lacking. It also regarded as distinctly vicious in character the fact that no compensation is to be allowed for an injury caused by the employee's willful intention to injure himself or another, or by his intoxication, while there was no provision such as appears in many of the State statutes permitting suit for damages where the injury results from the willful or malicious act of the employer or his representative. This was held to be a patent inequality, "which might bear heavily to the prejudice of employees."

The chief emphasis, however, was placed upon the lack of due process of law in the matter of determination of claims. The act provides that where compensation is not settled by agreement, either party may apply for the formation of a committee of arbitration, one member of which is to be nominated by each of the two parties, the third to be a member of the industrial accident board. This committee is to "make such inquiries and investigations as it shall deem necessary. The hearings of the committee, unless otherwise agreed, shall be held in the city or town where the injury occurred if within this Territory;" and a copy of the award is to be immediately sent to the parties, and is enforceable unless a claim for review is filed by either party within 10 days after the sending of the award. The court held that the omission of any provision for the sending of notice to both parties of the holding of the hearings was fatal, and that it was not enough that there might be notice given, but that it must be absolutely safeguarded that notice shall be given. It was not regarded as sufficient that the parties were to be called upon to nominate members of the committee, nor that they were to be given the privilege of demanding a review. "Neither the committee of arbitration nor the board can have a constitutional jurisdiction to proceed to a hearing and award without notice to the parties involved, and this notice must, of necessity, be provided for in the statute itself."

It is of interest to observe that the Hawaiian statute follows with practical exactness the provisions of the laws of Iowa and Massachusetts in regard to the formation of boards of arbitration and the assumption that the holding of hearings involves notice to the parties, without formal provision requiring that such notice be given. The New York law requires the commission to "order a hearing," and it may require the claimant to appear before an arbitration committee, but does not in form direct notice to both parties to appear.

The law of Michigan on this point is practically identical with that of Hawaii, while that of Oklahoma varies but little, notice not being specifically provided for, but the presence of both parties being assumed. On the other hand, the laws of a number of States are specific in directing that notice shall be given to both parties of any hearing that is to be held. It is evident that in a number of important States no difficulty has been found in the procedure under a law of corresponding or identical provisions with the provision adopted by the Hawaiian legislature, but that in any case the point involved is not a substantive one, and is easily remedied by legislative action, the principle of compensation being in no way affected.

Another point raised by the court was that of the right of trial by jury, which was held to be guaranteed to the citizens of Hawaii by a specific Federal constitutional provision, which "can not be ignored or set aside by the Territorial legislature." It was held not to be sufficient that there might be an appeal to the circuit court, with a trial by jury, following the award, since the matters that might be carried to the court on such an appeal were limited, and the jury would not have authority to determine the amount of damages or compensation to be allowed the claimant, citing the Ives case, and distinguishing the situation existing in Hawaii from that in New York, whose law is said to be in this respect substantially similar to that of Hawaii, and which was upheld as constitutional by the Supreme Court. While the discussion on this point is much less extensive than that relating to the matter of notice, it is obvious that the defect, if held to be such by the higher court, will be much more difficult to remedy by new legislation, inasmuch as it involves one of the important factors in procedure under compensation laws.

It is interesting to observe the authorities on which this decision rests and to note that difficulties are discovered which the courts of the States have overlooked in determining their laws constitutional. The case will doubtless be passed upon as promptly as possible by the supreme court of the Territory, and students of the compensation situation will await with interest the opinion of this court in its choice of precedents and interpretation of the law to be followed.

NOTE.

A letter from the secretary of the Industrial Accident Board, city and county of Honolulu, under date of December 20, 1917, states that a decision of the Supreme Court of the Territory of Hawaii handed down on December 11 reversed the decision summarized above, and pronounced the Territorial workmen's compensation act of Hawaii constitutional and valid.

INDUSTRIAL ACCIDENTS AND DISEASES.

UNIFORM STANDARDS FOR THE MANUFACTURE AND TRANSPORTATION OF HIGH EXPLOSIVES.¹

BY LEWIS T. BRYANT, COMMISSIONER OF LABOR, NEW JERSEY.

In discussing the subject assigned to me, I shall treat the matter of transportation of high explosives before that of their manufacture.

The necessity for uniform standards in the matter of transportation has been so apparent that the problem seems to have been solved in an excellent manner through the regulations issued by the Interstate Commerce Commission. These regulations have been formulated upon the recommendations of the Bureau for the Transportation of Explosives and Inflammable Material.

Before these recommendations were made by the bureau, consultations were held with the manufacturers and shippers of high explosives and the railroads which were to perform the transportation service. Types of containers have been specifically designated for both solids and liquids and the directions for shipment outlined in minute detail.

Naturally the jurisdiction of the Interstate Commerce Commission confines itself exclusively to shipments between States, and the matter of intrastate shipment is not included within their regulations. I understand, however, that in most States the transportation companies have insisted upon a compliance with rules substantially the same as those insisted upon by the Interstate Commerce Commission.

Previous to this action on the part of the Interstate Commerce Commission, which was encouraged by the Institute of Makers of Explosives, the different States enacted regulations which were framed without regard to the requirements in other States, and as a consequence were entirely lacking in uniformity. This state of affairs made it necessary for shippers to be conversant with a variety of laws, which were at times confusing and difficult to observe.

If it should be thought advisable to enact State regulations for the transportation upon railroads of high explosives and other

¹ This paper was prepared for the Government section of the sixth congress of the National Safety Council, held in New York in September, 1917, but was not read.

dangerous articles, the regulations provided by the Interstate Commerce Commission might well form the basis for such standards. As these rules are based on a long period of experience and have been tested for that mission, it is unlikely that State officials with a limited range of experience could add much to their value.

These regulations provide a list of shipping names by which explosives are known, which must be plainly marked on the package, and a number of articles by reason of their highly explosive nature are forbidden transportation. Certainly any State code should give rules of this character due consideration.

The question of transporting high explosives through the public highways of the State in either horse-drawn or motor vehicles is a matter which should receive careful consideration. The very greatest carelessness has been known to exist in this type of transportation and the lives of pedestrians, as well as those directly concerned in transporting the material, have been in danger.

The act relating to the manufacture, keeping, storage, transportation, and sale of explosives which was enacted by the New Jersey Legislature of 1917 has handled this question of transportation in the following manner:

Every vehicle while carrying explosives upon the public highway shall display upon an erect pole at the front end of such vehicle and at such height that it shall be visible from all directions a red flag with the word "DANGER" printed, stamped, or sewed thereon, in white letters at least 6 inches in height, or in lieu of such flag the words "EXPLOSIVES, DANGEROUS," must be painted or attached to the ends and each side of such vehicle in white letters on black background at least 6 inches in height.

It shall be unlawful for any person in charge of a vehicle containing explosives to smoke in, upon, or near such vehicle, to drive the vehicle while intoxicated, to drive the vehicle in a careless or reckless manner, or to load or unload such vehicle in a careless or reckless manner, or to make unnecessary stops.

It shall be unlawful for any person to place or carry, or cause to be placed or carried, any metal tool or other similar piece of metal in the bed or body of a vehicle containing explosives, unless contained in a box or other container approved by the commissioner of labor or his authorized representatives.

It shall be unlawful for any person to place or carry, or cause to be placed or carried, in the bed or body of any vehicle containing explosives, any exploders, detonators, blasting caps or other similar explosive material, or to carry in or upon such vehicle any matches or any other flame-producing device, except safety matches carried in a container approved by the commissioner of labor or his authorized representatives.

This provision of the law was decided upon after consultation with experts in the matter of such transportation, and there can seem to be no reason why, if these general provisions are necessary for safe practice in New Jersey, they should not be included in the laws of other States.

The matter of the manufacture of high explosives would seem to resolve itself into two general problems—first, the safety of the operatives employed within the plant, and secondly, the safety of those inhabiting the surroundings adjacent to the plant or points within fixed limits either from the public highways or steam railroads or trolley cars.

The protection of the operatives within the plant is twofold—first, from such injuries to health as may arise from contact with poisonous or unhealthful processes incident to the manufacture, and, secondly, from explosions. The matter of the interior regulations was taken up jointly by the representatives of the departments of labor of Pennsylvania and New Jersey. The leading authorities were consulted and a number of exhaustive conferences were held.

Joint regulations were formulated by these two States which were intended to fully protect the workers concerned in the industry. Due consideration was given to the best obtainable safe practices in vogue both in this country and abroad, and the regulations adopted included the best obtainable methods of safeguarding the operative from both the danger to health and the explosive hazard incident to the occupation.

Generally speaking, the matter of the health hazard is largely that of insuring the artificial removal of injurious fumes and dust and the maintenance of proper ventilation, the furnishing of adequate washing facilities, including showers, suitable toilet accommodations, separate and distinct eating places, and medical examination. The workers should receive most careful instruction as to the dangers incident to the employment, and great care should be taken against coming in contact with the absorbent poisons.

The joint regulations referred to include among their provisions the following:

Where the amount of gases or vapors produced in rooms or buildings is considered dangerous to health by the inspection department, an efficient exhaust system, constructed in accordance with plans which must be filed with the department of labor, must be installed and kept operating during all times when persons are employed therein.

Warning signs must be posted on the premises which strictly prohibit workmen from entering buildings where harmful fumes exist or tanks or confined spaces which are not entirely clear of these fumes. In case an entrance into buildings or tanks is necessary the worker must wear an approved helmet, and in addition he must wear a life line, which shall be in the hands of an assistant stationed outside of the tank. Employees who have been exposed to fumes and who feel sick shall report their condition to their foreman and shall be given proper treatment without delay. The responsibility for complying with these regulations shall rest upon the foreman or other official designated for that purpose by the management of the concern.

For every 50 persons or less employed in a plant where workers are exposed to harmful vapors there shall be present at all times at least two persons who are trained or competent to apply means of resuscitation by the prone pressure or Schaefer method or by mechanical devices that must be approved by the department of labor. A sufficient number of helmets of an approved type shall be kept at each plant, where they shall be available for use by every employee who has occasion to enter places where there may be asphyxiating or poisonous gases or fumes or vapors.

All employees who are required to wear helmets shall be thoroughly instructed in the use of such apparatus and shall be physically examined by a licensed physician at least once in 90 days or after absence from work due to either sickness or accident.

Bathing facilities shall be provided and clean clothing shall be kept on hand, so that all persons who are exposed to dangerous vapors and who are required by the regulations to bathe and change their clothing shall have opportunity to do so.

The regulations call for the installation of approved methods of dust and fume removal in all cases where they exist to an injurious extent.

As the very nature of the material handled makes it absolutely impossible to obviate all of the dangers incident to explosions, the most obvious and practical safeguard is to insist upon having the work performed by the minimum number of operatives necessary for a given process, so that in the event of an explosion, just as few workers as possible may be affected. These working units should be so separated by fireproof inclosures that in the event of a fire or explosion the danger will not be transmitted to another unit of the plant.

The storage of explosives is a subject of great importance in the regulations, which require that all buildings in which any quantity of explosives is manufactured, handled, used, or temporarily stored shall be classed as explosive buildings. Buildings used for storage for periods exceeding 48 hours shall be classed as magazines.

Explosive material not in process of manufacture but which is being used in loading detonators, timing, or priming caps, or any like manufacturing process, shall not be stored in workrooms wherein people are employed, except under the following conditions:

Where the quantity used for the day's run does not exceed 100 pounds, it is permissible to keep in closely covered receptacles that necessary for the day's run.

Where the quantity necessary for the day's run exceeds 100 pounds, only 100 pounds may be stored in the workroom at one time and then only at a place where it shall be suitably protected from careless or promiscuous handling. Additional supplies shall be brought from the magazine as needed.

Explosive materials being used in the above processes may be stored in any quantity in storage buildings erected for that purpose, provided that such buildings are not used for other purposes and are located at proper distances

from other buildings wherein persons are employed, or are protected by suitable natural or artificial barricades.

Fulminates or materials of like sensibility shall be brought into workrooms in quantities sufficient only for concurrent use.

Where materials giving off explosive vapors are stored in separated or underground storage systems outside of buildings, they may be distributed by approved types of pipe lines throughout buildings where persons are employed.

The openings which are necessary in fire-resisting walls shall be provided with an approved type of fire-resisting door, and these doors shall be kept closed at all times except when in use to permit passage from one room or portion of a plant to the other. On all such doors shall be posted an approved danger sign, warning against the carrying of matches or an open light and prohibiting the entrance of any but authorized employees or others designated by the manager or superintendent.

The number of employees in such rooms or portions of a plant shall be kept to the minimum compatible with the process of manufacture. This can be obtained by building additional fire-resisting portions or by the addition of small-unit buildings.

No open or naked lights, such as lanterns, stoves, torches, etc., shall be allowed in such rooms or portions of plants, except for necessary repairs under proper supervision. Watchmen or others using portable lights shall be supplied with vapor-proof lights.

Such rooms or portions of plants shall be lighted (if artificial light is needed) by means of an electric system installed in conduit or in lead-incased cables, with vapor-proof keyless lamps. All switches or fuses shall be located on the outsides of such rooms or buildings in a protected place. This installation must conform to the underwriters' standards. It would be preferable and desirable if all lights could be projected by reflectors into rooms from the outside through properly located windows. The employment of electric motors other than those of a sparkless induction type in the above rooms is forbidden.

All rooms or portions of explosives plants in which they are used, generated, or found and wherein persons are employed, shall be separated from other rooms or portions of plants by fire-resisting walls or partitions, pierced with such openings only as are necessary, except when such rooms or portions of plants consist of separate buildings. In such places where the material which is being used or which produces the explosive vapors does not exceed 10 gallons in quantity and is confined in approved safety cans, it will be necessary only to prohibit the use of naked flames, to post approved danger signs and to observe safe practices. Materials which give off explosive vapors shall not be stored in workrooms wherein people are employed, unless such materials are stored in closed containers properly vented. Where practical, safety cans should be used.

No employee shall have in his possession at any time in any explosives plant, any match or other flame-producing device, unless he is authorized in writing by the superintendent to do so, in which case approved safety matches only may be used.

A search for matches shall be made by some authorized person at least twice a week at irregular intervals. The finding of a match or other flame-producing device on the person of an employee not authorized to have matches in his possession shall be cause for instant dismissal.

All employees handling loose explosives or working in or around explosives manufacturing buildings where there is a possibility of explosion by the attrition of metals shall wear powder shoes or rubber-soled shoes (without iron or steel nails). No pockets shall be allowed in the clothing worn in any such

work except one skeleton pocket in either the coat or trousers. Neither iron nor steel buttons, nor other metal attachments, shall be allowed on such clothes, nor shall metal objects, such as knives, keys, etc., be allowed to be carried in the pockets.

All explosives buildings shall be provided at each entrance with suitable devices whereby the shoes of all those persons entering such buildings can be cleaned and all persons before entering such buildings shall wipe or clean their shoes.

Where explosives are carried from one building to another, as for instance from magazines to workrooms, employees carrying such explosives shall not be allowed to follow each other closely but must allow an interval of at least one minute in time or 100 feet in distance. This does not apply to such explosives as trinitrotoluol and smokeless powder.

The workrooms, when desirable, shall be heated by an approved system of steam, indirect hot air radiation, or hot water. The temperature of steam shall not exceed 120° C. The radiators shall be at least 1 inch distant from all wooden walls or other inflammable material and shall be attached in such a manner that they can be easily inspected and cleaned.

In addition to the foregoing regulations the following shall be observed with reference to the manufacture and handling of the respective substances enumerated below:

Nitroglycerin and dynamite.—The floor of the nitrator house shall either be covered with sheet lead or the nitrator shall stand in a suitable lead pan, drained to the drowning tank. All seams and joints shall be lead burned in a careful manner, so that there may be no crevices in which nitroglycerin will lodge. The floor shall be so constructed as to be readily washed and drained. New lead floor covering shall be extended by means of a round corner at least 3 inches up each side wall, thus making a sanitary corner.

At least two reserve thermometers shall be kept in each nitrator house for use in case of emergency.

No iron valves shall be allowed on any nitroglycerin pipe lines, except quick opening nitrator plug cocks, which shall be frequently lubricated. All other valves or stopcocks on nitroglycerin pipe lines or containers shall be of stoneware, earthenware, hard rubber, or wood and shall be kept clean and greased. No repairs shall be made during nitration except in emergencies. Nitrators shall be provided with coils for cooling by cold water, or brine or other suitable means and also with means for both mechanical and compressed air agitation. No more than two nitrators shall be installed and not more than three employees shall be regularly employed in any one building. During nitration the attention of one employee shall be given wholly to observing the thermometer and running in the glycerine. No charge of nitroglycerin shall be sent to the separator house in a hose line while nitrating operations are in process.

Each nitrator house shall be provided with a drowning tank which shall have a water capacity of at least five times the amount of the acid charges and be provided with an air agitator and water inlet. All valves shall be located conveniently for the operators in case of emergency.

The floor of the separator house shall be covered with sheet lead with all seams and joints lead burned in a careful manner, so that there may be no crevices in which nitroglycerin will lodge.

Not more than two charges shall be allowed in a separator house at one time. The maximum number of regular employees in each separate house shall be three. All stopcocks or valves on nitroglycerin pipe lines or containers

shall be of stoneware, earthenware, hard rubber, or wood. Catch boxes shall be provided on all outlets for wash water, and inside catch boxes, if used, shall be cleaned weekly, at times when there is no charge of nitroglycerin in the separator house. No charge shall be sent from the separator house at a time when a charge is being received. Each separating tank shall be cleaned and the floors washed daily at the conclusion of the day's work. It is permitted to carry on the three operations of nitration, separation, and neutralization in one building, provided that the regulations prescribed for each individual operation are complied with.

Not more than 12 employees shall be allowed inside of a cordite blending house. Not more than 10 employees shall be allowed inside of a gravity type of blending house. By gravity type is meant that type of blending house in which the entire charge of powder is deposited in a bin or funnel situated one or more floors above the packing floor. Not more than eight employees shall be allowed inside of a bin type of blending house, i. e., a house in which all operations are carried on on one floor.

The following materials are classed as explosives: Black powder (all varieties), dry guncotton, nitroglycerin, dynamite, chlorates, fulminates, fireworks, and any other of their compounds or mixtures or any other substances which are subject to explosion by the aid of shock, friction, spark, or heat. Smokeless powder, wet guncotton, and wet nitrostarch, while not properly classed with the above as explosives, are also included in these regulations.

While the summary of regulations for the manufacture of explosives covers a wide range of activities it is not entirely complete, and the department of labor of New Jersey, in conjunction with the department of labor of Pennsylvania, is now engaged in accumulating data with reference to providing rules for the safe loading of high-explosive shells and the filling of timing fuses and primers for high-explosive shells and Russian and American shrapnel. A catastrophe that occurred recently in a New Jersey factory where primers were being loaded caused the loss of life of 13 people, and emphasizes the urgent necessity for safety standards on this subject, while a disaster of far-reaching consequences involving a greater loss of life in a Pennsylvania plant forms additional evidences of the necessity for action.

Before the act relating to the manufacture, keeping, storage, transportation, and sale of explosives was introduced at the 1917 session of the New Jersey Legislature, Mr. Hershfield, the sponsor for the bill, directed communications to each State in the Union asking advice as to the best type of legislation for this subject. If the replies received by him could be read at this conference, no better argument for a uniform law could be produced. There seemed to be no comprehensive legislation on the subject, and the provisions of the act which was finally drafted were largely pioneer in their character.

It defines with great detail the distances at which buildings, railways, and highways may be located with reference to definite amounts of explosives. It sets forth accurate definitions of build-

ings, railways, and highways and includes a quantity and distance table.

It defines the maximum amount of explosives which may be stored and sets forth the allowances made for properly constructed barricades. It gives in detail the type of containers which must be used for keeping or storing explosives in any place within the State, and provides for properly labeling the containers. The character of magazines in which explosives may be kept or stored is indicated, and it is required that there be conspicuously posted thereon the words, "Magazine—explosives—dangerous."

It prohibits the storing of blasting caps or other detonating or fulminating caps or detonators in any magazine in which other explosives are kept or stored. Reports must be made to the commissioner of labor setting forth—first, location of magazine; second, contents of magazine; and, third, distance from the nearest buildings, railroads, and highways.

A certificate of compliance must be secured from the commissioner of labor, which may be canceled by him where future conditions do not constitute compliance with the law.

The law provides a license fee and requires an inspection at least once during each year of every licensed factory or magazine. It covers the transportation by vehicles on the public highways as already set forth, provides for penalties for noncompliance, and makes the following exemptions:

(A) For the regular military or naval forces of the United States or its allies, and the duly authorized militia of any State or Territory thereof, and the police or fire departments of this State, or of any municipality or county within this State, providing the same are acting within their official capacity and in the performance of their duties.

(B) To explosives being transported upon vessels or railroad cars in conformity with the regulations adopted by the Interstate Commerce Commission; the transportation or use of blasting explosives for agricultural purposes in quantities not exceeding 200 pounds at any one time, and of any explosives in quantities not exceeding 5 pounds at any one time.

It includes a provision relative to municipal ordinances and prohibits the use of liquor or matches within a plant. It provides for an indemnity bond to cover final judgments that may be rendered for damages caused to persons and property by reason of any explosion at the factory of the explosives there manufactured or handled, and permits the waiving of this bond where ability to discharge such judgment is set forth to the satisfaction of the department of banking and insurance.

The necessity of covering these various provisions in a uniform manner would seem apparent to any student of the situation, and has certainly been recognized by the Institute of the Makers of Explosives. This institute has prepared a suggested State law which includes regulations covering the matters which have been discussed in this paper. Their pamphlet on rules covering the handling, storing, delivering, and shipping of explosives would also seem to be an appeal for uniformity in this class of regulations, and the type of standard storage magazine recommended by them is a further argument for uniformity.

The trend of the working policy of modern industry in dealing with its living units is to substitute the imperative and unsatisfactory spirit that commands for the modern and more enlightened spirit of cooperation, and thus spur the worker on to his greatest effort by persuasion rather than to demand it through fear or force. Some of the larger and better managed industrial corporations who were dissatisfied with working results achieved under the old system, after investigating the possible cause of discontent and friction prevailing throughout their working jurisdiction, arrived at the conclusion that the constant migration of labor that severely handicaps the profitable operation of business, is due in a large measure to unsuitable working surroundings, affecting either the safety, health, or comfort of employees.

Experience has demonstrated that a plant labor policy is a failure when it is not broad enough to comprehend the physical needs of the human body and its dependence on warmth, cleanliness, and food, and furthermore does not inspire confidence in the worker that the employment is provided with the largest measure of safety to life and limb that the nature of it will permit.

The advantages that accrue to industry, when a careful and intelligent investigation of working processes has been made the basis for establishing shop rules are manifold and are now fairly understood by an ever-widening circle of intelligent employers, who condemn practices that cause exposure to physical risk.

The physical care of the worker in the light of scientific research is not a proper subject for speculation or experiment, and, indeed, it is now ranked as a matter of incalculable importance, and is placed in the same business columns with the question of wages, hours of labor, and production.

The nature of certain portions of the explosive industry requires a man of more robust health than other occupations, and alcoholism makes a worker far more susceptible to the dangers of the industry.

To my mind the very nature of the industry under discussion makes it necessary for the enactment of regulations which are pre-

pared by those having a more technical knowledge of the subject than could properly be expected from the average legislator.

There can be no doubt but that the conscientious manufacturer who is anxious to properly safeguard the life, limb, health, and comfort of his workers would welcome uniform legislation along these lines, and certainly the unscrupulous or indifferent employer should not be permitted to expose his workers to unhealthful or dangerous conditions.

On the whole, I believe the best way to reach the situation would be the adoption of a uniform standard of regulations by the several States or a Federal act covering the situation.

ACCIDENT HAZARD OF THE INEXPERIENCED MAN IN THE STEEL INDUSTRY.

The question as to whether the "green" man in industry is more subject to accident than the experienced man is of particular interest at the present time when great industrial activity has resulted in so many new men being taken on in certain industries, notably the iron and steel industry. The question is also one of very great practical importance, since, if it is true that the green man is peculiarly liable to accident, efforts toward accident prevention must take this factor into account.

The limited data so far available indicate that the inexperienced worker does have a very high accident rate, and that the rate tends to decrease with his degree of experience. But the available information is so limited as to warrant the separate publication of the following table as a contribution to the subject. This table, taken from a forthcoming report of this bureau on accidents in the iron and steel industry, shows the accident frequency rates per 1,000 300-day workers, classified according to their amount of experience. The data are for a group of 3,527 300-day workers in a large steel plant during a period of 5 months.

ACCIDENT FREQUENCY RATES ACCORDING TO LENGTH OF SERVICE.

[Data for a large steel plant January to May, 1916.]

Length of service.	Number of 300-day workers.	Number of accidents.	Accident frequency rates.
Six months and under.....	512	57	111.3
Over 6 months to 1 year.....	278	29	104.3
Over 1 year to 3 years.....	357	31	86.8
Over 3 to 5 years.....	637	27	42.4
Over 5 to 10 years.....	814	16	19.7
Over 10 to 15 years.....	470	4	8.5
Over 15 years.....	459	0	
Total.....	3,527	164	46.5

The striking feature of the above table is the steady and marked decline in the accident rate with increasing experience. It is altogether probable that even more striking results would appear if the first year could be more finely subdivided.

The table has one feature which should render its testimony of greater weight than that of most compilations on this subject. Ordinarily the only available information is the number of accidents to men of a given degree of experience. The fact that there were, in a given period, 10 accidents to men of less than 6 months' employment, while to those employed 6 months to 1 year there were 5, suggests that there was a greater hazard to those of shorter experience. It does not prove the point, however, as in order to do that it is necessary to know how much labor was performed by men of each degree of experience; in other words, to know the number of 300-day workers. In the preparation of the above table this information was available with sufficient accuracy to give entirely reliable results for purposes of comparison.

Finally, it is to be noted that other factors besides inexperience may account in part for the showing made in the above rates. For example, workers of more than 15 years' service are to a considerable extent, for one reason and another, those who have passed out of the extreme danger zones. Their immunity is probably much more due to that fact than to the degree of their experience.

But, after all necessary qualifications, it would appear that beyond question this table does establish a strong probability that the inexperienced man has high hazard on account of his inexperience. In such case it becomes little less than criminal that he should be thrust, as has been too often the custom, into those occupations in their nature extra dangerous.

SECOND INDUSTRIAL SAFETY CONGRESS OF NEW YORK STATE.

The second annual New York State Industrial Congress was held at Syracuse on December 3, 4, 5, and 6, 1917, approximately 400 delegates being in attendance. The papers and discussions at this congress revealed the earnest desire of those taking part to develop in every practical way the means at hand to promote the safety and conserve the lives of workers in industry. While not the announced purpose of the congress, it may be said that it did, in fact, emphasize several important principles suggested by the addresses given and intended to safeguard the interests of labor as well as promote industry and operate for the universal benefit of employers. Thus the congress emphasized the necessity for unceasing vigilance against

relaxation of the standards of law enforcement during the period of war pressure; for the standardization and better classification of accident statistics; for the standardization of the workmen's compensation laws and of the general labor laws of all the States; for taking steps to prepare industry for the assimilation of returned soldiers; for a more complete enforcement of the factory laws in all the States, and in New York State in particular; and it approved labor's program for a universal eight-hour day.

It is not possible to give synopses of all the addresses and discussions presented at the congress. This article is therefore confined to a statement showing some of the points brought out which may be helpful to employers and workers in preventing the huge toll of lives annually sacrificed on the altar of carelessness and negligence.

At the opening session on Monday, December 3, five addresses were given. Carlton A. Chase, president of the Associated Manufacturers and Merchants of New York State, declared that wounded and disabled men will need special places in industry after the war, and urged the congress to indorse some plan by which industry may be able to assimilate them.

James P. Holland, president of the New York State Federation of Labor, brought greetings from the 800,000 wage earners of the State who he said are heartily in accord with the purposes of the industrial safety congress and are firm in their desire to help win the war.

Dr. Royal Meeker, Commissioner of the United States Bureau of Labor Statistics, pointed out that the foundation of all safety work is the proper recording of industrial accidents, classifying them by causes and showing the time losses resulting from the injuries suffered. We should not confine our efforts to the standardization of accident statistics. Our compensation laws should be standardized, as well as our labor laws in general. It ought not to be possible for one State to defeat labor legislation on the plea that it would drive industry to a neighboring State. Labor laws should be enacted for the same purposes in all the States. Each State must adjust its laws to its peculiar necessities, but there should be no great variations. There are laws on the books now of which people have never heard simply because they are not enforced. There is no attempt to enforce them. It seems to me one of the most important duties of the labor unions of this country is to see to it that the labor laws on the statute books are enforced. Much new labor legislation is needed, but a little enforcement will accomplish more than much legislation. Better enforcement of existing labor laws will do more than any other one thing to allay industrial unrest, which is the most serious menace at present to the proper prosecution of the war.

"Industrial education as a safety measure" was the subject of an address by Marian K. Clark, chief investigator, Bureau of Industries and Immigration, who emphasized the importance of teaching English to foreign laborers as a means of decreasing the enormous loss of life through accidents.

Marcus A. Dow, general safety agent, New York Central lines, who spoke on the "Rule of reason," uttered a warning against permitting the deterioration of man power as the result of the possible breakdown of safety standards in industry owing to the pressure of war. "I have no sympathy with the thought that because lives are necessarily sacrificed for a righteous cause on the battlefield other lives must be unnecessarily sacrificed at home through neglect. Surely, the killing of 22,000 and the seriously injuring of half a million industrial workers in the country each year is a serious drain on the man power of the Nation at a time when every available man is needed for the work that is to be done."

Lucian W. Chaney, of the United States Bureau of Labor Statistics, called attention to the responsibility of employers in promoting the safety movement, the emphasis heretofore being placed on the employees' share of the responsibility. This attitude has caused the movement to suffer. Engineering revision, which includes the widest possible application of engineering skill, was declared to be essential in order to discover the lurking dangers which lead to death and devise remedies to prevent them. This engineering revision refers to the location and relation of buildings, the organization of transportation facilities, the design of every mechanical contrivance, the provision of safe means of access to every point to which a workman would ever be required to go, the adequate covering of every moving part, even where no one is expected to go since the exigencies of operation can never be foreseen, provision against the falling of objects from elevations, and a thousand other items to which safety men may think they have given full attention but which the record of accidents prove have not yet been adequately considered.

"How the employer feels about it" was presented by J. E. Eaton, general manager of the General Electric Co., Schenectady, N. Y., who read a paper prepared by J. A. Smith, general superintendent of the same company. He spoke of the favorable attitude of employers toward accident prevention as evidenced by the safeguards thrown about machinery and apparatus, and the elimination of dangerous conditions and practices. He said it was a patriotic duty now to prevent shop accidents.

At the Tuesday afternoon session David S. Beyer, of the Liberty Mutual Insurance Association, Boston, Mass., led the discussion by

stating that both mechanical devices and education are equally important for safety; Frank Ward, safety engineer, Otis Elevator Co., gave the experience of his company with shop committees in conducting a safety campaign, and indorsed the plan; Earl B. Morgan, of the Norton Co., Worcester, Mass., spoke on "Accident prevention in its relation to labor turnover," stating that intelligent, well-planned, and efficient safety organizations will do much to reduce the constant change in personnel of employees. At the evening session A. J. Van Brunt, director of safety education, Public Service Corporation of New Jersey, gave it as his opinion that accidents never "just happen," but are caused by carelessness on somebody's part, each having behind it a train of logical, connected circumstances to account for its occurrence. Safety first means the elimination of nearly 95 per cent of these causal circumstances. This statement was made following the quoting of statistics by A. H. Young, of the American Museum of Safety, showing that 1,500,000 wage earners were seriously injured and 22,000 were killed in industrial accidents in America last year. This carelessness on the part of workmen, however, was attributed by John M. O'Hanlon, editor of Legislative News, to the conditions surrounding them in their work, existing because of the negligence and irresponsibility of employers who "scorn all modern ideas and devices of safety and sanitation, accepting them only under compulsion and regarding them ultimately as hindrances to speedy production."

A tribute to organized labor for what it has accomplished in its campaign for improving conditions was paid by Arthur E. Holder, legislative agent, American Federation of Labor, who concluded his address with the following recipes for the reduction of the accident ratio:

Increase the age for child workers.

Shorten the working hours.

Hold regular conferences in shop offices, composed of supervisors and workmen, for the purpose of discussing shop affairs from a standpoint of safety.

Post Davy Crockett's slogan on the bulletin board. "Be sure you are right, then go ahead."

Ask public-school teachers to give lessons on "Safety."

Request pastors to call attention to the subject from their pulpits.

Encourage moving-picture producers to feature as many safety ideas as possible.

Another good old slogan: "Better be safe than sorry."

More factory inspectors, and a better selection. An efficient inspector should be a properly trained man.

Urge employers personally to examine proposed speeding-up schemes before installing them.

Urge Congress to collect national accident data to cover every industry in every State.

An important feature of the congress was the session devoted to the general subject of "Working women in war time," special consideration being given to the matter of substitution of women for men in war industries from the point of view of safety and health. It was brought out at this session that there is no immediate necessity for the employment of women in places now held by men, one speaker suggesting as proof of this the great number of men now out of work.

The general subject of Thursday's sessions was "The employer and the labor department inspectors," embracing a discussion of the best method of establishing proper cooperation between employer, employee, and inspector. Charles Barnes, director of the State bureau of employment, warned against what he characterized as the tendency of some manufacturers to replace their male employees with women to cover "shortage of labor," stating that "there is in this country enough human beings potentially capable of doing all the work required, and that, too, without materially (as yet) increasing our number of women workers. But large bodies of workmen will have to be trained and retrained to meet new technical needs, and employers must face the problem of doing this training." The work of the State bureau of employment was analyzed, showing what had been accomplished during the preceding 12 months in registering over 90,000 people, receiving requests for employment from nearly 114,000 workers, and in offering jobs to a little over 110,000, of whom approximately 73,000 were actually placed. Upon investigating alleged scarcity of labor, Mr. Barnes continued, one or more of three factors were found to exist. Either (1) the call was for trained workers in technical lines, or (2) the demand was for husky laborers to do work calling for strong physique and endurance, or (3) the employer was offering too low wages, often coupled with long hours and bad working conditions.

Following Mr. Barnes' paper the various phases of factory inspection work were presented by John J. McSherry, Samuel C. Wilson, Patrick Shea, and William Gorman, factory inspectors.

HEALTH HAZARDS IN THE CUTLERY INDUSTRY AND MORTALITY FROM TUBERCULOSIS AMONG WORKERS.

Dangers to the health of workers in the cutlery industry are due to mineral and animal dusts, fumes, and gases, and to faulty illumination, according to the report of a special investigation of this industry at Northampton, Mass.¹ This investigation was conducted

¹ Massachusetts. Fourth annual report of the State Board of Labor and Industries, January, 1917. Boston, 1917. pp. 121 to 145.

under the direction of the State department of labor and industries and embraces four large factories employing about 600 men. Studies were made of each step in the process of manufacture with special reference to the health hazards involved, of the methods employed in diminishing the hazards associated with the process of manufacture, and of the present mortality rate among cutlery workers at Northampton and vicinity. It was found that in general the dust hazard is greatest in three departments, (1) handle, sawing and milling, (2) grinding, and (3) polishing and glazing (including buffing); that fumes and gases present a serious hazard in the forge department, where carbon monoxide is present, and in the hafting department, where lead and antimony, copper and tin are used; and that the practice of placing the machinery parallel to the windows, with the result that the hoods used to remove the dusts frequently shut off much of the light, gives rise to a faulty illumination which is quite a serious hazard and seems to have received little or no attention in the industry.

The report gives an account of existing conditions as the investigators found them in these four establishments, noting the apparent ineffectiveness in the design of the hoods, and their abuse by the workers who, in order to get better light, often push them back at some distance from the wheel, thus increasing the dust hazard and causing a black deposit to form on the walls and windows and reducing materially the illumination. The conclusions drawn from a mechanical survey of the cutlery industry with reference to the dust hazard are stated to be as follows:

1. A dust hazard exists in those rooms or departments where dry grinding and polishing are done. Mechanical exhaust has been provided in all of the factories investigated, decreasing the dust hazard to a marked degree, but will permit of great improvement.

2. All dry grinding and polishing wheels should be carefully hooded and connected with an adequate blower system. The hoods should be so designed and placed as to catch the dust as it is thrown from the wheels, and immediately guide it into the branch pipe opening.

3. Hand holes should be made into the main suction pipes at frequent intervals along their length to permit of frequent cleaning. Systematic cleaning and overhauling of the exhaust systems should be practiced.

4. The operatives should be educated to properly use at all times the dust-elimination devices installed for their protection, and to realize the hazard to their health resulting in their failure to follow these precautions.

5. The education of the employers as to the hazards to which grinders and polishers are subjected, and the necessity of improving the present exhaust installations, are essential.

At Northampton, according to the report, there were 13 deaths from pulmonary tuberculosis among cutlery workers during the years 1911 to 1915, inclusive, and during the same period among

those whose occupation was not associated with the cutlery industry, there were 78 deaths of males and 55 of females. At Montague, another cutlery center, during the period 1912 to 1915, inclusive, there were 5 deaths from tuberculosis among 300 cutlery workers, and 17 deaths from tuberculosis among noncutlery workers. These data are given in the following table:

MORTALITY FROM TUBERCULOSIS AMONG CUTLERY AND NONCUTLERY WORKERS AT NORTHAMPTON AND MONTAGUE, MASS., SHOWING AVERAGE AGE OF EACH GROUP AT TIME OF DEATH.

Year.	Northampton.						Montague.					
	Cutlery workers.		Noncutlery workers.				Cutlery workers.		Noncutlery workers.			
	Num- ber. ¹	Aver- age age at death.	Number.		Average age at death.		Num- ber. ¹	Aver- age age at death.	Num- ber. ¹	Average age at death.		
			Males.	Fe- males.	Males.	Fe- males.				Males.	Fe- males.	
1911.....	4	40.3	14	8	40.2	36.0						
1912.....	1	59.0	23	14	40.9	37.7	1	40.0	2		(²)	
1913.....	2	53.0	15	8	40.5	37.4	1	44.0	3	23.5	18.0	
1914.....	1	40.3	15	10	33.4	37.2	1	31.0	10	38.7	36.3	
1915.....	5	48.2	11	15	32.7	38.7	2	29.5	2	38.0	35.0	

¹ The report does not classify these by sex.

² Females.

³ Not given in the report.

The data set out in this table would seem to indicate that (1) death from tuberculosis is not so prevalent among cutlery workers as among noncutlery workers (adult males); and that (2) the age at time of death among cutlery workers who die from tuberculosis is higher than the age at time of death from tuberculosis among noncutlery workers, both male and female.

From this study of the cutlery industry the following conclusions are drawn:

That the dust hazard can be reduced to a minimum by hoods properly placed, in accordance with the type of work carried on, on the particular machine creating the dust.

That the placing of the machines at right angles to the line of windows would guarantee adequate illumination and remove the necessity for pushing aside the hoods installed on the different machines.

That the powdering of the wheel with pumice and oil should be classified as dry grinding and polishing and not wet grinding and polishing; also that adequate exhaust should be installed on these machines.

That all gases, fumes, and smoke incidental to any process of manufacture can be adequately removed by efficient exhaust system.

That the high mortality associated with the cutlery industry is unnecessary, and can be reduced almost to the minimum by suitable attention to dust removal.

That the process of polishing, grinding, and buffing of small articles is a greater element of dust hazard to the worker than the same work on larger articles, because of the necessity of close proximity of the worker to the grinding, polishing, or buffing surface.

That the study of the cutlery industry at Northampton shows a marked improvement on the conditions set forth in the report of 1907, dealing with the cutlery industry at this same center.¹

PROTECTION OF HEALTH OF MUNITION WORKERS IN ITALY.²

TRANSLATED AND SUMMARIZED BY ALICE HAMILTON, M. D.

Three pamphlets dealing with the prevention of industrial disease among munition workers in Italy have just reached this country. They are issued by a central committee for industrial mobilization under the ministry of arms and munitions, and they bear the signature of Dallolio, minister of arms and munitions.

It appears from these pamphlets that munition work in Italy is carried on partly in Government-operated and partly in private factories, and that for the supervision of the latter the central committee for industrial mobilization has appointed local branches which are to exercise a certain control over conditions of work in them. The instructions contained in the pamphlets are directed to military officers in charge of Government works and local committees for industrial mobilization.

The first pamphlet bears the date of June 16, 1917. The occasion for its issue is said to be the urgent necessity both for increasing the number of women employed in the munition industries and for making their work steadier and more valuable. It is no longer sufficient to persuade larger and larger numbers of women to enter these factories. The experience of Italy, like that of her allies, is that far too large a proportion of these women leave the factory after a few months' employment, especially if they are married women and mothers of families. It is indispensable that the causes for this excessive labor turnover be analyzed, since its effect is to hamper very greatly the output of war necessities.

Under the insistent call of their country, Italian women of all social classes have entered munition works. Most of them had never before been subject to the discipline of factory work, hence the necessity of carefully scrutinizing this new army of women workers in order to make the best use of them, and of not permitting them to be

¹ Annual report of the Massachusetts Board of Health, 1917.

² Italy. Ministero per le Armi e Munizioni. Comitato Centrale per la Mobilitazione Industriale. *Vigilanza igienico-sanitaria*, June 16, 1917, 11 pp.; *Istruzioni per la vigilanza igienico-sanitaria*, June 29, 1917, 56 pp.; *Pronto Soccorso in casi d'infortunio*, Sept. 25, 1917, 3 pp. Rome, 1917.

exploited for the profit of their employers, nor subjected to exhausting labor, but conserving as far as possible their physical health and their moral health. The task of thus humanizing industry by preventing overexploitation has seemed so important to the British Minister of Munitions as to lead him to appoint a special department for the welfare of munition workers, a move which has been followed by indubitable success.

In order to bring about the same results in Italy a new department has been created by the ministry of arms and munitions, namely, a bureau of hygienic and sanitary control (*Ufficio di Vigilanza igienico-sanitaria*), which is to act in cooperation with the local committees of industrial mobilization in applying standards of hygiene and of medical care, to assure for the working classes favorable conditions of work and of treatment, bearing always in mind, however, the supreme necessities of the munition industry under war conditions. The bureau of hygienic sanitary control hopes to carry out the task of preserving the physical integrity of the working classes largely through the assistance of doctors who are to be attached to the munition plants and are to assist the local committees in formulating and applying hygienic rules for the individual establishments under the committee's control. These doctors are to work in connection with the committees, but under the supervision of the bureau. They must be men of high professional standing who have had experience in industrial hygiene. Each physician is to send regular monthly reports to his committee, concerning the cases of industrial disease which have come to his notice, so that the committee may know what preventive measures should be insisted upon. Apparently he does not inspect the factory, except when an unusually high sickness rate is reported to the committee. The reports are forwarded by the committees to the bureau of hygiene and sanitation, with which apparently rests the authority to pass upon all instructions to physicians and to factory owners.

The pamphlet points out the special difficulties attendant upon the employment of large numbers of women. Rooms should be provided where mothers may nurse their babies, crèches where the babies may be cared for during working hours. It is the doctor's duty to see that a pregnant woman stops work for four weeks before the birth of her baby. He must also be alert to combat tuberculosis, alcoholism, and venereal disease "which will find so fruitful a soil in this new industrial army of women and children."

The bureau urges employers to remember that to-day the problem of labor is not only a problem of work, but also of the physical, moral, and intellectual future of the race.

On June 29, 1917, the bureau of hygiene and sanitation issued a booklet of convenient size, containing the fully formulated instructions to all the local committees on the subject of health and sanitation in munition works. Here the duties of the industrial physicians are set forth in great detail, and a list of industrial poisons is appended, with all necessary information as to the nature and prevention of industrial poisoning.

The statement is made that a new step has been taken in Italian industry; for the first time the hygienic care of the employee in his place of work will be undertaken through the entry of the physician into the factory, and a new relation inaugurated between physician, employer, and worker. The industrial doctor is warned that this is a task requiring the greatest possible skill and tact, and that it is his duty to use persuasion and gradual education in order to convince the manufacturer of the industrial and technical utility of adopting protective measures for his workmen. He must cooperate with the departments of labor and of health; he must be scrupulously careful not to betray any trade secrets. In his effort to protect the workers he is warned that he must always bear in mind the national emergency and counsel nothing that might impair the practical usefulness of the factory. All measures for safeguarding workers in specially dangerous occupations must first be submitted to the ministry of arms and munitions, for justice may demand that such measures, if adopted, be imposed on all similar factories in Italy.

Medical examination before employment is required for children of both sexes and for girls under age. The physician issues a permit for work which in his opinion may be undertaken without injury to the physical development of the child, stating also for what sort of work, if any, the child's strength is not adapted. These children and girls must be examined regularly while they are working, and whenever they change their employment. If the physician declares them unfit for work, they must be refused. Similar physical examinations are necessary¹ for others, especially women and adolescent boys, in order that it may be known whether they are fitted for employment in munition works. In the industries that are known as unhealthful, periodical examination of all the employees is necessary, so that early signs of poisoning may be detected. The physician is to be paid by the employer, but his selection and appointment are to be passed upon by the local committee.

The powers and duties of these industrial doctors are very carefully defined. The doctor must maintain secrecy as to the industrial

¹ The word used for the examination of children is "Obbligatorio;" for that of adults, "Necessario."

sickness he discovers; even in making out his report to the local committee he must only indicate symptoms without stating his diagnosis, although the case may be entirely evident. He may not himself suspend the sick person from work, but he must at once report the case to the bureau of hygiene, which will see to it that the local committee takes appropriate action. If he discovers persons in the early stages of poisoning or detects oversusceptibility to poison, he must confer with the employer as to suspension from work or shifting to other work. No worker may be reemployed except after medical examination. The industrial doctor is warned that while it is his duty to instruct the worker in methods of protection against disease, he is forbidden to advise him against entering these dangerous trades. Physicians attached to factories are required to report all cases of industrial disease to the local committee; physicians in private practice are courteously requested to do the same.

A list of industrial diseases which must be reported is given, but the physician is to indicate only acute cases of poisoning. He may specify the symptoms of chronic poisoning as given in the appended list, but he must not make a diagnosis of any specific form of industrial chronic poisoning. The substances which may give rise to industrial poisoning in the making of munitions are as follows: Benzol and toluol; anthracene; naphthalene; phenol; nitro and nitroso derivatives of benzene and phenol; amido derivatives of benzene; halogen derivatives of hydrocarbons of the fatty series (tetrachlorethane and trichlorethylene); nitrous gases; lead and its compounds; chromates; phosphorous and phosphoreted hydrogen; arsenic and arseniureted hydrogen; mercury and carbon disulphide. A concise yet adequate description is given of the industries in which these substances are used, the special processes which involve the greatest danger, the importance of individual predisposition to the poison, the mode of entrance and of elimination, the pathology, so far as it is known, the symptoms of acute and chronic poisoning, and the method of prevention and care.

General rules of hygiene applying to all these dangerous trades are given as follows:

Occupations involving special danger must be carried on apart from other work.

Floors, walls, workbenches and other surfaces should be smooth, even, impermeable, easily washed. Cleaning should be thorough and frequent, always with water if possible, and if infection is to be feared, with disinfectants.

Ventilation should be adequate, including not only a general air supply, but, where necessary, local air removal and supply.

There should be adequate natural and artificial lighting.

All refuse and débris should be frequently removed.

If poisonous material can not be kept in a moist condition, efforts should be made either to prevent dust or to draw it away at the place where it is produced.

Apparatus designed to control gases and vapors should be mechanical and automatic, with well-fitting coverings and impermeable pipes and ducts.

The number of persons engaged in manual work should be reduced as much as possible. Where handwork must be done, it should be carried on under a hood provided with a good draft, and with tools so made as to permit the worker to stand at a distance from the dangerous material, or else the harmful effects of the dangerous substance should be lessened by condensation of vapors or neutralization by means of well-tested reagents.

For transport for discharging fluids or powders, etc., closed channels or mechanical methods should be used, especially in cases of volatile or corrosive substances.

The crude material, the finished product, and the refuse, if it contains soluble toxic substances, should not be left out of doors, but in well-closed places under lock and key. These substances should be kept in covered receptacles, labeled, and with the word "poison" inscribed. Wherever possible innocuous or less toxic compounds should be substituted.

The following should be provided and their use required: Working clothes of good material, closed at the collar and wrists, to be washed at least once a week; head covering; gloves of rubber or leather in good repair, fitting under the cuff of the suit; shoes and sabots (wooden shoes); protective goggles; and, if necessary, respirators. All these to be kept in good condition, washed and repaired.

Dressing rooms should be provided separate from the workrooms with individual lockers, if possible, containing two compartments, for street clothes and working clothes.

Workers should be forbidden to introduce, keep, and consume food or drink in workrooms. They should not be allowed to smoke or chew tobacco while at work.

A refectory should be provided, with some means of warming food brought from home. No one should enter the refectory without having removed his overalls and washed himself.

Careful washing of the person after work should be insisted upon, both before lunch and on quitting work. Wash rooms in adequate number should be provided, with hot and cold water, soap, nail-brushes, and individual glasses for drinking or bubbling fountains. In the more dangerous industries tub or shower baths should be provided.

The workman should be instructed concerning the dangers to which he will be exposed, and this instruction should be repeated often. Printed instructions, briefly and clearly expressed, should be placed conspicuously about the factory.

Workmen should not have beards nor long hair and the mustache should be cut short. The greatest temperance in the use of alcoholic drinks should be advised, and workmen should be counseled to drink a great deal of milk and not to start work on an empty stomach.

A first-aid equipment should be provided and kept ready, including a cylinder of oxygen and hypodermic needles.

Medical examination should be made at the beginning of employment and periodically thereafter according to the danger inherent in the work. The weak and anemic and those with pulmonary lesions should be excluded. In case of mild poisoning there should be suspension from work, but the oversusceptible and those who have had more than one attack of poisoning should be discharged. No suspended person should be reemployed until he is entirely cured. For the most dangerous tasks the hours should be short and the workmen given change of employment at intervals.

The third pamphlet issued by the bureau of hygiene and sanitation is in the form of an open letter to all military men in charge of governmental munition works and local committees of industrial mobilization. It is dated September 25, 1917, and is apparently called forth by some serious cases of industrial poisoning. Inspections made in both governmental and private munition works show that insufficient attention has been paid to the provision of proper equipment for first aid in the specially dangerous industries, such, for instance, as the manufacture of explosives. "Too often it has become evident, to our grieved surprise, that an accident has resulted seriously or even fatally because timely help was lacking, the necessary medical supplies had not been provided, or the proper instructions for their use had not been given to the people in charge. The continually increasing pressure of work in munition factories forced by the supreme urgency of the present state of war requires most rigorous observance of those simple rules of hygiene and medical treatment in case of accident, which is the duty of all who employ labor and the right of all who accept employment; for even if these rules are not enforced by existing labor laws they are sanctioned by one of the most exalted religious sentiments—that of human brotherhood."

As far back as April 30, 1917, the necessity for providing quick and adequate medical care in establishments manufacturing explosives was urged by the minister of munitions, and arrangements were made by the local committees of industrial mobilization to have

physicians, in collaboration with the factory inspectors, render at least the indispensable minimum of care to the sufferers from industrial poisons and accidents. "It seems now, however, that the provisions for such care must be taken up again and pushed by all the authorities directly and indirectly concerned with munition work, in order that in the shortest possible time every military and every private factory doing war work shall be equipped with a proper first-aid department, which shall include what is absolutely necessary for that factory, according to the nature of the work done and the number of persons employed."

The name of the physician attached to the factory and his telephone number should be¹ posted in view in the first-aid room and in the timekeeper's room. If there is no doctor attached to the factory, some proper person should be trained in giving first-aid for injuries and in administering artificial respiration. This person is to have charge of the first-aid supplies. The first-aid room should be well lighted and ventilated and warmed in winter. It should always be clean. The following are the supplies absolutely indispensable for its equipment: Solution of bichloride of mercury 1-1000, or of lysoform; a locked box with absorbent cotton, gauze, bandages of different widths, all in closed packages; tincture of iodine, freshly prepared, and applicators kept in a corked bottle; stimulants, such as camphorated oil, 10 per cent, and a hypodermic preparation of caffeine, marsala, cognac, and infusion of coffee; hemostatics; bismuth, or carron oil for burns; a hypodermic syringe, always ready for use; forceps; a stretcher, which can also serve as a cot; a wash room, with water, soap, towels, and vessels for waste water; in addition, any equipment which the doctor may think necessary for that particular factory.

In places where there are gases and vapors known to be capable of producing poisoning, a rest room also should be provided, with one or more beds, and alkaline or ammoniacal solutions for spraying, oxygen under pressure, and a bathtub with hot water.

Industry has its casualties as well as war, and in all workshops where human life is imperiled let there be not only all the mechanical protective measures which the special nature of the work requires, but let there also be provided and kept in efficient condition everything which science has devised to render less painful and less dangerous to the worker the consequences of accidents occurring in the course of his work.

¹ The expression used throughout this paragraph is "it is necessary," not "obligatory," which makes these appear to be counsels, not commands.

SOCIAL INSURANCE.

SALARIED EMPLOYEES' INSURANCE IN GERMANY DURING 1916.¹

TRANSLATED AND SUMMARIZED BY ALFRED MAYLANDER.

The directorate of the Imperial Insurance Institute for Salaried Employees has recently published its report for the year 1916. The principal object of this youngest branch of the German social insurance system is the payment of old-age and survivors' pensions. The law, however, provides a waiting time of 10 and 5 years for the payment of such pensions and this waiting time has not yet elapsed. So far only those insured members who had shortened their waiting time by the payment of extra premiums could present a claim for pension. Very few members have availed themselves of this privilege of shortening their waiting time, and consequently the number of old-age pensions paid by the insurance institute in 1916 was only 9 and that of survivors' pensions 15. The chief activities of the insurance institute, therefore, consisted in the collection of premiums and the granting of such voluntary benefits as are permitted by the law.

During the year 1916 the total amount of contributions paid to the institute by employers and insured members was, in round figures, 113,000,000 marks (\$26,894,000). That the collection of contributions is connected with considerable difficulties is made evident by the fact that during the year under review the obligation to insure was contested in 13,953 cases; 7,558 of these disputes were still pending at the end of 1916. The paid-in contributions were largely invested in war loans, the institute having subscribed 60,000,000 marks (\$14,280,000) of the fourth and fifth war loans. This subscription brings the total amount so far invested by the institute in war loans to 260,000,000 marks (\$61,880,000).

Of the voluntary benefits granted by the insurance institute for salaried employees the granting of medical treatment comes first in importance. The institute during 1916 received 24,184 applications for curative treatment, i. e., 9,105 more than in the preceding year. The total cost of medical treatment granted during the year was

¹ From *Hamburger Nachrichten*. Die Angestelltenversicherung im Jahre 1916. Hamburg, Aug. 10, 1917.

7,400,000 marks (\$1,761,200). Curative treatment in tuberculosis hospitals was granted to 4,853 members, in sanatoriums to 4,898, and in baths and watering places to 5,162, while 2,586 members were given treatment in general hospitals and 2,728 in dispensaries. In 310 cases the institute granted a subsidy for curative treatment.

The directorate of the institute also has taken special measures to facilitate the return to civil life of members who have been invalided during the war while serving in the armed forces. It has set aside a sum for the vocational readaptation of members invalided in the war. During 1916 the directorate received 95 applications from maimed members who wished to undergo a course of vocational training. Sixty of these applications were approved, 11 were rejected, and the remainder were still pending at the close of the year. As thorough experiments have shown that suitable dogs can be trained to lead blind men safely on the streets and to call their attention to dangers from public traffic, the directorate resolved to grant to members who have become blind in the war the means for the acquisition of such dogs.

The insurance institute has also been active in combating sexual diseases. For this purpose it has borne part of the costs of the dispensaries for sexual diseases maintained by the State invalidity insurance institutes.

In connection with the present article it should be remarked that of late considerable agitation has developed for and against the abolition of the salaried employees' insurance system and the combination of it with the workmen's invalidity and survivors' insurance system.¹

This agitation had its beginning in an article published in 1916 in the "*Zeitschrift für die gesammte Versicherungs-wissenschaft*" in which Prof. Manes criticized the high cost of administration and the defective organization of the salaried employees' insurance system. He points out that the annual cost of administration amounts now to 3,000,000 marks (\$714,000), that the staff of the salaried employees' insurance institute consists of more than 2,300 employees, and that the expenditure of 10,000,000 marks (\$2,380,000) for a new building to house the institute is now being contemplated. Prof. Manes also states that the law of December 20, 1911, creating the salaried employees' insurance, was enacted for political reasons; it was intended to separate the salaried employees from other wage workers as a special social class. He says that the war has done away with such class distinctions and their upholding would endanger the social peace. He proposes abolition of the salaried employees'

¹ From *Vorwärts*. *Der Streit um die Angestelltenversicherung*. Berlin, Aug. 22, 1917.

insurance as a special insurance system, and extension of the workmen's invalidity and survivors' insurance with obligatory insurance of all gainfully employed persons earning less than 3,000 marks (\$714) per year, and voluntary insurance of those earning 3,000 to 5,000 marks (\$714 to \$1,190). At the same time he proposes that the benefits of the invalidity insurance be increased.

Two other articles by Dr. Brumm, a member of the directorate of the State Invalidity Insurance Institute, Berlin, and by Privy Councillor Dr. Zacher, published in the same magazine, fully support the contentions of Prof. Manes. Dr. Zacher points out that according to estimates presented to the Reichstag before the enactment of the salaried employees' insurance law the cost of administration of this insurance should not exceed 2 per cent of the receipts from contributions, that to-day the cost of administration has reached double this percentage and will amount to 10 per cent as soon as the payment of pensions begins. He also condemns from a social point of view the separation of salaried employees and workmen, because the latter live under the same economic conditions as the former and because millions of small undertakers and agriculturists are insured in the workmen's insurance system.

In a recently published booklet¹ Hans Blankenstein, a Berlin author, makes the statement that the agitation for the abolishment of the salaried employees' insurance is inspired by the Imperial Insurance Office (*Reichsversicherungsamt*) which intends to bolster up the unfavorable financial condition of the workmen's invalidity insurance institutes at the expense of the salaried employees' insurance institute. In support of this contention he states that the latter is in an excellent financial condition by reason of the good investment of its capital at an average rate of interest of $4\frac{3}{4}$ per cent, as compared with that of the capital of the invalidity insurance institutes at an average interest rate of $3\frac{3}{4}$ per cent; that the capital of the invalidity insurance institutes has, moreover, decreased by 65,000,000 marks (\$15,470,000) and that it is expected that the war will further deteriorate their financial condition on account of increased risks.

For the better understanding of this controversy it should be stated here that the proposed incorporation of the salaried employees' insurance into the workmen's invalidity insurance would bring to the salaried employees advantages as well as disadvantages. The advantages are the following: The Empire pays a subsidy to all pensions of workmen insured in the invalidity insurance institutes but not to pensions of salaried employees insured in the salaried employees' insurance institute. In the invalidity insurance the waiting time is only 4 years, in the salaried employees' insurance it is 10

¹ Blankenstein, Hans. *Beseitigung der Angestelltenversicherung*. Berlin, 1917. 36 pp.

years. During the present war salaried employees are seriously affected by this provision. As the salaried employees' insurance came into force on January 1, 1913, it does not entitle its members to a pension if they have been disabled in the war nor do the survivors of members killed in the war have claim to a pension. The provisions as to the suspension (*Ruhen*) of pensions are also more unfavorable in the salaried employees' insurance than in the workmen's invalidity insurance. In the salaried employees' insurance payment of pensions is suspended whenever the otherwise entitled claimant is in receipt of some other income of a specified amount. In such cases the contributions paid are lost. In the invalidity insurance the payment of pensions is not made dependent on the income of the beneficiary from other sources.

On the other hand, salaried employees would be at a disadvantage if insured in the invalidity insurance institutes for the following three reasons: First, the salaried employees' insurance institute pays pensions if the earning capacity of the insured member has been lessened by 50 per cent. The corresponding percentage prescribed by the invalidity insurance institutes is $66\frac{2}{3}$ per cent; second, the salaried employees' insurance institute pays pensions to widows in good health, while the invalidity insurance institutes pay widows' pensions to invalid widows only; third, the salaried employees' insurance institute pays pensions to orphans up to their completed eighteenth year of age, the invalidity insurance institutes only up to their completed fifteenth year of age.

The Vorwärts suggests that the dispute could easily be settled by admitting salaried employees to all the advantages of the invalidity insurance and by increasing the present benefits of the invalidity insurance for members willing to pay an extra premium.

HOUSING AND WELFARE WORK.

SOCIAL BETTERMENT WORK AMONG EMPLOYEES' FAMILIES.

BY ELIZABETH A. HYDE.

It must be evident to the most casual observer of industrial conditions that social betterment work in more or less isolated communities becomes a matter of the employee's family and not of himself as a part of the actual working force. Steel mills and coal mines have their wash and change houses for the workers, and their first-aid and hospital provisions; but their clubhouses and libraries, their recreation grounds and social gatherings, their nurses and welfare workers generally are for the benefit of the community and not alone for the men within the plant. No other industry studied in the recent investigation of welfare work by the Bureau of Labor Statistics—which covered 431 establishments, having a total of more than 1,660,000 employees—approaches the two mentioned in the amount of work done among families, with the exception of cotton manufacturing in the South. Examples of conspicuously good family work are found, however, in many other industries, notably foundries and machine shops and explosives. There are, of course, great differences in the amount and excellence of the work done by various establishments, depending to some extent on the nature of the working force and the isolation of the plant but far more on the character and ideas of the employer.

Of the 431 establishments for which schedules were secured, 158, with a total of about 838,000 employees, were found to be doing more or less social betterment work among their employees' families, generally along the following lines:

(1) Improving the dwellings and the streets, installing sewerage, lighting, and water systems, and assisting in gardening.

(2) Providing educational, religious, and recreational facilities.

(3) Introducing to the community a nurse or other capable visitor to advise in the care of the sick and the children, to instruct in American methods of home making, to develop the community spirit by organizing and fostering clubs, and to be the sympathetic friend in time of trouble.

Work of this kind has transformed squalid towns into clean and attractive places and has much improved their standard of living.

The extent to which the various branches of betterment work are carried on by the companies reported in the present study is shown in the following statement:

Per cent of the 158 establishments doing each kind of work.

Visiting nurse.....	53.80
Playground	39.87
Domestic-science classes.....	27.22
Welfare worker	26.58
Charitable relief	26.58
Settlement house	19.62
Kindergarten	18.35
Land for gardens.....	17.10
Christmas presents to others than needy.....	14.56
Classes other than domestic science.....	13.29
Prizes for gardens.....	11.40
Doctor	8.23
Day nursery	5.70
Clinic	5.06
Christmas gifts to needy.....	3.80

LIVING CONDITIONS.

Many of the four and six room houses recently constructed have porches, pantries, and clothes closets, and are neatly fenced. In some of the towns practically every house has running water and sewer connection. Electric lighting is becoming general. The best houses have bathtubs. Employers who complain that the bathtubs installed are used as coal bins, or not used at all, probably overlook the fact that in many cases water must be heated and carried to the tub in the old-fashioned way and that bathrooms built on porches are likely to be cold. The community bathhouse, with separate compartments or buildings for the women and children, exists in several places. These bathhouses may be inexpensively installed and maintained and are considered by at least one mill manager in the South the most satisfactory of the various forms of welfare work attempted.

Streets are graded, walks laid out, and young trees planted. In certain cases landscape gardeners are employed to supervise the town planning and instruct in gardening. Some employers are finding that fences, unless of wire or metal, are an expensive feature; they fall rapidly into disrepair and sometimes are willfully destroyed for firewood. In a number of cases all fences have been removed and company land at a distance is allotted for gardens and stock, the maintenance of unfenced gardens being difficult or impossible. In other cases a fence of metal posts and wire is used.

In some instances gardens are plowed free of cost by the company or the plow and team are lent to the householder, and the free dis-

tribution of seeds and cuttings is not uncommon. In a large proportion of cases, however, the householders are able to finance their garden plots and the employer contributes only supervision and prizes. "City beautiful" contests, with generous prizes for the best lawn, best flower garden, best vegetable garden, best porch or window boxes, and best general appearance, stimulate the householders' interest in a new community.

Children's gardens on company land are reported by 27 of the 158 companies doing work among families and 18 companies give prizes or otherwise encourage home gardening. In the towns of one company alone there have been as many as 7,000 gardens, or 95 per cent of the total number that could be planted, the average value of the vegetables grown being over \$20 per garden. Where gardening is undertaken on a considerable scale the work is in charge of a paid instructor, under whose supervision the children must work in the gardens for a certain number of hours a day. In one notable case the company provides for each of 80 boys a plot 53 by 11 feet, and there is a cooperative plot which all must help to work. It gives the whole time of an instructor, the seeds and plants, overhead-sprinkler system, tools, wheelbarrows, express wagons, diaries, books and papers, club rooms, and prizes. The course lasts two years. The boys are incorporated as a stock company under the laws of the State and elect their own officers.

PROTECTION OF HEALTH.

The health of the industrial community is recognized as of such importance that measures for its protection form the largest single department of betterment work as reported in this study. Some of the measures in operation in a number of industrial towns are as follows: Draining or filling in of pools and lowlands, or their treatment with crude petroleum, to exterminate the mosquito; screening of houses, at cost or without charge, and the distribution of circulars explaining in a simple way the dangers of the house fly; provision and care of garbage cans; bacteriological analysis of the water used for drinking; regulation of the milk supply.

Of the 158 companies under consideration, 85 report that they have a visiting nurse, or some one acting in that capacity, who, in addition to actual care of the sick, instructs the women of the community in nursing and in the preparation of food, and teaches the value and necessity of cleanliness and the benefit of fresh air and sunshine. Quite often the nurse's headquarters are the community house or model cottage described in a later section of this summary (p. 201). It is not unusual for her employer to give her the use of an automo-

bile. These persons usually are under the direction of the company physician or plant manager, though they may be connected with the district nurse association where such an organization exists. It has been found that where a visiting nurse has been installed in a community, and her services have been announced as free to employees' families, men in whose homes there is sickness work more regularly and with easier minds than formerly, to the great benefit of the shop.

The following statement of family visits made by two nurses in one summer month may be regarded as typical of the better class of work done:

Object of visit.	Visits in district A.	Visits in district B.
Domestic science.....	37	60
Sanitary hygienics.....	28	52
Dinner buckets.....		41
Care of babies.....	103	36
Care of mothers.....		35
Care of sick.....	107	46
Employment sought.....	6	31
Employment found.....	18	31
In regard to circumstances.....	51	54
Placed in sanitariums.....	5	2
Sent to hospitals.....	4	5
At request of schools.....		23
Total.....	359	416

Several companies in the South report that medical treatment of the families is supplied at little or no cost to them. This is, of course, exclusive of the arrangement whereby the employees' fees cover also their families, and also the practice in some villages of limiting the fees which may be charged by private practitioners.

Free clinics, or clinics charging for medicines only, are conducted in eight of the cases reporting; three of these give dental and one gives optical treatment. In one case toothbrushes have been provided free to school children by the employing company, free dental treatment is furnished children in the first and second grades, and lectures on the care of the teeth are given before adults and the children of the higher grades. The optical work comprises tests, prescriptions, and the provision of glasses at cost.

At least one company has a first-class milk clinic dispensing certified milk at less than cost to the public and without charge to the destitute, and prescribing for infants through a corps of nurses and a doctor; another company sells milk below cost; four companies do antituberculosis work; two or more vaccinate against typhoid; and three have fresh-air camps to which invalids may be sent. In one town a 2-cent lunch is served to the school children and in another the experiment is being made of serving school lunches free. One

company has a fund for crippled children and many make a practice of paying for hospital and surgical treatment in necessitous cases.

Day nurseries for the small children of mothers employed outside of the home are reported by nine companies, the majority being in the South. Children between 4 months and about 8 years of age are received in the nurseries, and the usual charge is 5 cents a day. A higher charge may be made if the father is employed, and one nursery reports that slightly more is asked in midsummer to cover the cost of ice. Nursing mothers are allowed by the employer to leave their work two or three times a day.

RECREATION.

Of recreational facilities the most common are the baseball field and the children's playground. These are found almost invariably where community work of any magnitude has been undertaken, and vary all the way from "a piece of land where the men play ball" to a large and extensively improved field, with high fence, box office, grand stand, dressing rooms, moving-picture apparatus, and refreshment stand; and from an unfenced plot with a swing or two and a seesaw to an elaborately equipped inclosure that would put to shame many a city playground. Sixty-three companies, or 40 per cent of all reporting family work, have playgrounds of one sort or another. As in all the other activities described, this of course excludes places where the welfare measure in question is provided by the community or other agency so that it is unnecessary for the employer to undertake it.

The equipment of one playground, which has an attendance of between 200 and 300 children at a time, is as follows: 1 shelter house, 2 toilet houses, 2 bathhouses, 1 swimming pool, 1 wading pool, 2 drinking fountains, 2 sand boxes, 1 jump pit, 2 volley-ball courts, 1 baseball ground, 6 box swings, 12 rope swings, 6 seesaws, 1 giant stride, 1 large slide, 1 small slide, 4 flying rings, 4 climbing poles, and 3 horizontal bars.

Unless the children are few and the equipment is of the simplest there is generally a competent person in charge of the playground, and sometimes there are several such persons, including volunteers. In some cases sewing, carpentry, basketry, and other handwork are taught, and folk dancing is general. Almost invariably the behavior of the children improves rapidly, playground work being one of the most satisfactory of welfare undertakings.

For the older members of the community there are athletic fields, soccer and tennis courts, and basket-ball grounds, the equipment for which is provided by the players or lent to them by the caretaker of the grounds. In the South the question of parks for the people

has for some time been receiving attention; 14 of the companies reporting have parks of some sort and 3 others have immediate plans therefor. Here again the variety of standards is very great. A "park" may be merely an unimproved piece of woodland which the employer has decided to leave in its natural state as a pleasure place for the people, either with no equipment at all or with benches and perhaps a band stand; or it may rival the most beautiful small parks in existence, with club facilities, dancing, skating, games, and music, in an exquisite setting of trees, grass, flowers, and running water.

Indoor recreation is commonly provided by means of a club or settlement house, managed by the employees themselves, by paid social secretaries, by churches, or by the Young Men's or the Young Women's Christian Association. The church mission is active in the South, and among the 8 reported in the present study there are good and bad examples of its occupancy of the field. Ordinarily the mill not only provides the cottages used in the work, but assumes no inconsiderable part of the financial burden of the work. The missions do work similar to that of secular institutions in recreation, education, nursing, sanitary supervision, etc., with the addition of religious services on Sunday. Where two or more mill villages are a short distance apart, one mission may extend its activities, devoting certain days and evenings to each village.

The industrial department of the Y. M. C. A. has been in operation in the South for many years, and 3 of the companies report that their educational and recreational work is done with success under these auspices.

In a notable group of western mining camps the betterment work has been undertaken by the Y. M. C. A. upon vote of the employees. The company provides the buildings and equipment and the Y. M. C. A. assumes full responsibility for the methods and policy of operation. Clubhouses which are models of their kind—representing an expenditure of from \$15,000 to \$25,000 each—are being erected in the various camps, and some 20 secretaries and 10 trained women workers already are employed. The families of the men attend the moving-picture shows and on certain days and evenings are allowed to use the bowling alleys and pool room, gymnasium and baths, library and reading room. In at least one case where assimilation is difficult, foreigners of one nationality are given the exclusive use of the building for a few hours each week, since in no other way can they be induced to visit it.

Fees for games, like minor furnishings, classes, refreshments sold, and other unimportant details, vary from camp to camp, but the

members' dues—50 cents a month or \$5 a year for men and 15 cents a month or \$1.50 a year for boys under 16—are uniform. On Sundays the games are free to members, who alone may play, and they may be indulged in all day except during the hours of religious service. This is but partial evidence of the commendable breadth of view with which the work is being conducted. In order that membership fees may be kept within the reach of all, the company makes a monthly appropriation toward operating expenses, besides paying for heat, light, water, and repairs. Some branches are so successful that the company's cash contribution has been materially reduced, if not entirely suspended. The receipts of the soft-drinks counter, which dispenses also ice cream, candy, cigars, tobacco, and perhaps sandwiches, amount sometimes to several hundred dollars a month.

There are communities where the betterment work is successful only when carried on by the Y. M. C. A. or other outside agency, largely financed by the employer but without other participation by him. Where wages are high the work may be done to no small extent by the employees themselves, the company providing almost always the initiative and the buildings and in many cases the heat, light, and equipment. A conspicuous example of employees' management is a textile mill having between 15,000 and 20,000 operatives where an employees' organization of more than 1,600 members, with annual dues of \$2 and a fund raised by entertainments, conducts the excellent clubs and classes and much of the recreational work. The company houses and otherwise assists the organization, and provides visiting nurses, dental clinic, and recreation grounds for adults and children.

The settlement house—or community house of the South—ordinarily is a more humble affair than the club buildings mentioned, though there are notable exceptions to this rule. Thirty-one, or 20 per cent, of the companies reporting conduct their welfare activities through this medium. The accommodations vary from one of the workers' dwellings or a disused official residence to suitable buildings put up and equipped for the purpose. Where the house is small it may be the model home of the community, furnished and operated in such manner as the other householders would do well to imitate. Cooking classes meet in the tiny kitchen, housekeeping classes make the beds and sweep and dust. A few shelves of books and a dozen magazines constitute the library; chess, checkers, and pinochle, the games. Though probably it may be said with truth that so simple an endeavor as this makes little appeal to anyone but the children of the community, it is a fact that the children are of the greatest importance unless we except the older girls who will become housekeepers within a few years. If the worker in charge is a mature, capable, and tactful woman who succeeds in gaining the confidence

of the women of the community by friendly visiting and nursing, her influence is strongly felt.

Where the house and equipment are more elaborate, accommodating considerable numbers of persons in the various rooms and having many activities, the settlement more nearly resembles a clubhouse, and accordingly meets with the response deserved by such outlay. Some half dozen of the cases reported belong to this class.

The head worker of one of these large and successful settlement houses recommends that social work in an industrial community should invariably begin through such an agency. First, it can and should begin in a small way, developing as the needs of the community become apparent; second, it should begin with educational work for the children, preferably through a kindergarten, since the workers are thus brought into contact with the homes; third, its policy should be flexible, without distinctions as to sex, race, or creed; and fourth, it should be undertaken in a spirit of willingness to meet the demands for increased equipment and enlarged quarters as the work grows.

Social affairs may be arranged by the welfare workers at no cost to the community, but the indications are that the most popular affairs are at least partly managed and financed by the people. In a large number of cases the most important day of the year, to the families as well as to the employees, is the field day or other outing in which practically everyone participates. In the mining and steel communities the occasion is elaborately celebrated, with parades, first-aid contests, races and competitive events, penny scrambles for the children, and other entertainment. Visitors attend from miles around and the affair receives considerable notice from the press.

In the southern cotton-mill villages the churches generally manage the annual outing, assisted financially by the mills. As a rule, several mills combine, and Independence Day is chosen for the festivity, which ordinarily is an unpretentious Sunday-school picnic. Of the 42 cotton mills reporting, 15 have an annual gathering of this character.

Christmas celebrations are reported in 29 cases. These range from the giving of baskets of provisions to needy families only, to the presenting of a ham, turkey, cake, basket of fruit, or \$5 bill to each family in the village, and the setting up of a community Christmas tree, with instrumental music and singing and the distribution of candy, apples, and small gifts to the children. One company reporting has given to each of 4,000 children a pound of candy, an orange, and two apples.

RELIGION AND EDUCATION.

The building, or assistance in the building, of places of worship is common. Among certain races of foreigners, as among the mill people of the South, the religious instinct is very strong, and the community is made better and happier by having a church building within easy reach. Occasionally the company finds it necessary to give financial assistance in order to secure the services of a capable minister, and in a few cases such person acts as welfare worker in the village.

The school is another institution the improvement and fostering of which, in a community where the employer is practically the only taxpayer, may contribute to the welfare of the people. In some Southern States there are examples of remarkable cooperation on the part of the mills. The term is lengthened by several months, a better class of teachers is secured by the payment of higher salaries than are provided by the State, beautiful buildings are erected, and a rule that no man may remain in the employ of the mill who does not send his children to school acts in the place of the nonexistent State law. Other features are the operation of kindergarten and elementary grades in villages too far from the State schools for the attendance thereon of small children, the assembling of mixed classes for older, backward pupils ashamed to go to school among the little folk, and the carrying on of high-school work in places where the State makes no such provision. Sometimes the social work of the village is carried on by the teachers, their residence—provided by the company—forming the community or settlement house.

In the West is a children's community cottage the walls and floors of whose four rooms were tinted and stained by the boys of the school, while the girls made bed and table linen, towels, curtains, and dresser scarfs. The simple furniture was bought by the children, who raised a fund by giving entertainments. Here the girls are taught housekeeping, and the mothers of the various nationalities are entertained at luncheons or afternoon parties. In this community school credits are given for work done by the children in the homes, either in duties about the house or in teaching English or other subjects to the parents.

WELFARE WORKERS.

The character of the person charged with such welfare work as requires family visiting or other intimacy is of the utmost importance. Health, balance, courage, patience, sympathy, and infinite tact are essential. The wisdom of this worker's having a time and place on which no one may intrude, and occasional leave of absence

for refreshing and stimulating contact with other social workers and with the outside world, is undoubted. There may be great harm in work done half-heartedly or in a haphazard way; consequently it is of first concern that the workers keep fit.

The experienced welfare worker or nurse may be intrusted with a small relief fund not too closely scrutinized, and frequently may be consulted with advantage regarding proposed dismissals or other harsh measures. Where the labor turnover is considerable, she may, by her census of families, keep the management informed on many things of significance. Even when supported largely by outside agencies, such as a church mission, the worker should cooperate as closely as receives response with the management of the industry. A tactful visitor to the homes may, through her knowledge of wages and income, suggest a wiser expenditure, more careful house-keeping, or—conversely—the retention in school of a child of legal working age, or the return to home work of an employed mother. She may interest the families in cooperative buying; stores conducted under this system exist in several of the industrial communities reported and cooperative buying of one or more articles of large consumption is practiced in many others.

Work of great value is being done in teaching the nursing of the sick, the care of babies, the wholesome preparation of food, the economical making and repair of clothing, the cleaning and ventilating of the home. The first and second named are universal needs, while ignorance of good cooking is especially prevalent among certain classes. According to the schedules, sewing is more generally taught than is cooking, perhaps because the latter requires a more elaborate equipment and frequently forms part of the public-school work. A wider use of the sewing machine should be encouraged as more practical than handwork after the rudiments have been acquired, and young people can thus be interested in making simple clothing.

ORGANIZING OF CLUBS.

The clubs organized by welfare workers in the communities studied vary in character from the toothbrush brigade or the Blue Birds (girls too young for the Camp Fire) to civic organizations of no mean standing. One of the latter class is transforming a foreign colony in the Middle West which has had anything but a favorable reputation into a respected and self-respecting community. Married women's clubs, though in successful operation in 20 cases among the southern cotton mills reported, are not easily managed. It is difficult to get busy mothers out, and some of them object to being supervised by a woman perhaps their junior, probably unmarried, and almost certainly of another class than their own.

Boys' clubs are a problem everywhere. One Y. M. C. A. clubhouse with three paid workers has temporarily abandoned its boys' room because the supervisors can not prevent rowdyism. The Boy Scout organization has hundreds of branches in industrial communities and these are a success practically everywhere. Manual training is always an outlet for youthful energy; first-aid teams are excellent, as is the work in the gardens, described in an earlier part of this summary.

For girls the field of sewing, fancy work, weaving, basketry, cooking, home making, nursing, child care, first aid, and surgical dressings is almost limitless. There are many branches of the Camp Fire organization, and gardening and canning clubs are numerous. One mill village in the South has recently opened a beautiful clubhouse for its girls, the management here evidently believing, as a superintendent elsewhere is quoted as saying, "Raise up a generation of fine girls and the question of the men will take care of itself."

NECESSITY FOR THE WORK.

While the ideal American condition is one under which the community, entirely distinct from the employer, provides for the welfare of its citizens by means of clinics, playgrounds, libraries, educational classes, social centers, etc., where an industry is carried on at a distance from a city these things must be provided in some other way. Nor can the working people themselves, in the great majority of cases, be expected to make such provision. Scores of communities exist in which recent immigrants largely outnumber the native born, and where American standards of living are as little understood or desired as in the villages of southeastern Europe. Furthermore, the establishment of these things requires considerable outlay of money, and even where wages are fair the greater part of the burden must fall elsewhere than on the wage earners. To quote from an industrial settlement worker already referred to in these pages:

But the wage that is fair to the workman from the point of view of value given to his employer does not mean to the large mass of laborers a wage that is sufficient to keep his family in more than the necessities of life. It does not mean that he is able to provide anything in the way of education which the public does not offer him. It does not mean that he can provide suitable recreation for his children and it does not mean that he can provide them with books. Therefore, whatever the laborer and his family are to have above and beyond the necessities of life, must, under present conditions, come entirely from outside sources. Man as a unit is not worth sufficient wage in many cases to give advantages to family and, in far too many cases, would not use money for such purposes when earned. The body of workmen, representing composite labor of an organization, should have, not as charity, but as business justice, the best the company can afford to give them.

SOCIAL AND EDUCATIONAL ADVANTAGES FOR EMPLOYEES.

BY ANICE L. WHITNEY.

In several of the recent issues of the MONTHLY REVIEW, articles discussing various phases of the work for industrial betterment as carried on by employers have been published. The present article deals with the means taken by many of the companies for the entertainment or the mental stimulus, through lectures and club work, of employees outside of the working hours. Four hundred and thirty-one schedules were taken, covering a wide range of industries, such as mining, many kinds of manufacturing, public utilities, offices, and stores.

The work of directing the amusement of employees is one that must be approached with care by the employer. Many firms have made little or no attempt in this direction, preferring to provide some of the more essential forms of betterment, such as emergency hospitals and lunch rooms, and to leave to the individual the question of what shall be done with his leisure hours. In some cases the distance of the plant from the homes of the workers has militated against anything of this nature being tried, or if begun, has necessitated its abandonment; in other cases the feeling that the employee would object to any interference on the part of his employer with the time which is his own has prevented attempts by the members of the firm to institute any of the various means of amusement. It is perhaps easier in this line of service work than in any other for the employer to assume a paternalistic attitude, and it would appear from the reports that this is felt by many employers, who have found it wiser, in order to avoid the danger of employees suspecting such a tendency on their part, to leave the development of the recreational features to the employees themselves, with the knowledge that proper efforts along these lines will be assisted and encouraged by the company.

In the following table the establishments furnishing one or more of these features of recreation or culture for their employees are given by industries:

ESTABLISHMENTS HAVING SOCIAL GATHERINGS, LECTURES, MUSIC, OUTINGS, ETC.,
BY INDUSTRIES.

Industry.	Number of establishments.	Number of employees.	Number of establishments having—								Outings.

¹ Not including employees of 2 establishments, not reported.² Not including employees of 1 establishment, not reported.³ Not including employees of 4 establishments, not reported.

There were 274 establishments—of which number 270 reported the number employed to be 1,219,150—which reported entertainment, either indoor or outdoor or club work among employees, contributed to in some degree by the employer. In 188 of the establishments social gatherings, such as dances, banquets, theatricals, or parties are held on special occasions like Hallowe'en or Christmas. Dances, being the easiest form of entertainment and the one most generally enjoyed, of course predominate.

In the many cases where the companies have provided clubhouses the club committees, with the clubhouse as a meeting place, naturally assume the leadership in social affairs, and usually the fees for club membership cover the most, if not all, of such activities. Even though there is no clubhouse provided there are many establishments in which there are employees' clubs which promote and manage all gatherings of a social nature among the employees. In many establishments these clubs are purely recreational in character: however, in 22 instances the athletic association or the benefit association has

charge of the social affairs, and any surplus gained from them goes to swell the funds of these organizations.

Usually there are large rooms in the plants—either lunch rooms, recreation rooms, or auditoriums—which, with the expenditure of a little labor, can be temporarily converted into a dance hall or may be used for other amusements. Sometimes the use of such a room, together with heat, light, and janitor service, is all that is given by the company. Frequently when no room large enough is available in the plant, the firm hires a hall for the use of the employees for their social affairs. Other firms make a money contribution to the recreation club, and quite a number seek to bring all the employees together in a social way at one large affair during the year, in which case the expenses are usually met wholly or nearly so by the company. One of the street railway companies gives a free theatrical entertainment in the auditorium of its clubhouse each month, except during the summer, and each winter a vaudeville entertainment is given daily for one week in the same place, thus enabling all employees to attend some time during the week. Free tickets are given to all employees and their families and transportation furnished for all who attend. Several dramatic clubs are found which give plays, often several in a season: the minstrel show, also, is popular as a means of entertainment. Two companies presented very elaborate masques, each of which was written especially for the company giving it, and dealing largely with the evolution of the particular kind of work in which each of these companies is engaged. Both of these events included many of the employees as participants and were attended by thousands of spectators.

The activities of one of the large insurance companies along these social and educational lines are centered in the athletic association and an entertainment committee. The athletic association each year, under the sanction of the company, conducts an excursion which is attended by the clerks and members of their families and friends. Each year the association gives a concert or opera, in the company auditorium, followed by dancing. Aside from the orchestra, all of the participants are members of the company. For these affairs tickets are sold. Once or twice during the winter smokers are held for the men and a nominal admission fee is charged. A season's course of entertainment is arranged by the entertainment committee. These affairs, given entirely at the expense of the company, consist of lectures, concerts, and moving pictures, and are held in the afternoon immediately after the close of office. Noon-day concerts are also given twice a week by local talent in the company auditorium, which has a seating capacity of 1,000. These noon meetings are very popular. The auditorium has a grand piano, a concert phonograph,

a stereopticon, and a moving-picture machine. There are various musical clubs among the employees. For the purpose of better acquaintance among employees a dinner is given each year by the company to several hundred of the men, and about 150 of the women are given a luncheon each year for a similar purpose.

AUDITORIUMS FOR THE USE OF EMPLOYEES.

Each of 63 of the companies provides an auditorium either in the plant, clubhouse, or Y. M. C. A. building. In the 14 cases in which the seating capacity was reported, it varied from 300 to 5,500; the majority of these rooms, however, seated between 400 and 800. These auditoriums usually have an adequate stage and in most cases the seats are removable so that the room may be used for dances and other social affairs. One company with about 4,500 employees has two rooms, one seating 1,500 and one 5,500, each equipped with a pipe organ and a piano. The smaller room, in addition, is supplied with a moving-picture outfit. Musicals and illustrated lectures are given from time to time, some of which are free; others are given, however, to supply funds for some charitable purpose. Many of the large department stores use their public auditoriums for gatherings of the employees, but these stores have not been included with the 63 establishments reported, because the rooms are primarily for the use of the public.

LECTURES AND MOVING PICTURES.

Ninety-four establishments report the provision of lectures or talks to employees on various subjects. In some instances the talks are quite informal, being given to the employees during the lunch period or at the close of the working period. In 24 establishments the lectures were on "safety," and were frequently illustrated with stereopticon views. Also, moving pictures were exhibited—other pictures being shown to secure a good attendance—and a short talk on the subject given in connection with the "safety" reels. In 70 cases the lectures dealt with a variety of subjects, such as health, first aid, travel, current events, technical subjects, and plant problems. Two companies report that their lectures are given on the employer's time. One of these has weekly lectures on technical subjects; the other has occasional lectures on safety and health, which are attended usually by about 1,200 persons.

One company reports starting an evening course of lectures, but as the employees were widely scattered it was so difficult to get them together in the evening that it had to be given up. Two southern cotton mills report that lectures were tried but were discontinued because of lack of response on the part of the employees. On the

other hand, most of the establishments report a good attendance, varying, of course, with the interest to the employees of the subjects presented, in some cases the attendance being as high as 1,500 or 2,000 at a single lecture.

Moving pictures were reported in 32 cases. A few of the companies had moving picture machines in the building, but more often they were installed in the clubhouse or Y. M. C. A. building. Often, where the plant was located in a small town, the moving pictures were open to the public, and pictures were shown usually once or twice a week and an admission fee of 5 or 10 cents was charged. About the only advantage resulting to the people was that a better class of pictures was shown than could ordinarily be provided for that fee. When the moving pictures were shown in the plant or clubhouse, however, it was seldom that any fee was charged.

MUSIC CLUBS AMONG EMPLOYEES.

Musical organizations such as bands, orchestras, and glee clubs are quite numerous. Fifty-six companies report bands which range all the way from one of 10 or 12 pieces to organizations with 100 instruments. One company having many foreign-born employees has four bands, one of these being composed exclusively of Slavic and one exclusively of Hungarian players. The companies contribute to the bands in various ways. Many of them contribute instruments and uniforms and hire leaders and most of them provide a place for the band to practice. Those companies which make no contribution other than a place to practice have been excluded from the count, since it is probable that the value of this slight assistance is more than offset by the worth of the band to the company as an advertising feature. Sometimes these bands give concerts at regular intervals, in other cases an occasional concert is given, but usually the band plays at company picnics or outings and at other social affairs. In some cases the company pays for these services. One company having a band with 44 members has noon concerts on the lawns during the warm weather, which are attended by 4,000 of its employees. Another which has a band with 100 members provides a band hall containing a large room for rehearsals, clubrooms for cards, pool, and shuffle board, and a reading room well supplied with periodicals. Still another company has monthly concerts given by its band, to which no admission fee is charged and which are attended by about 3,500 people.

Twenty-two of the companies have orchestras and 23 establishments have choral societies or glee clubs. The companies usually pay the instructor, buy the music, and in several cases, both for bands and orchestras, the members are paid for the time spent in practice.

The orchestras range in size from 10 members to 100, the majority having from 25 to 35 members.

There is but one orchestra reported having 100 members. This orchestra started a few years ago with a membership of 12. It has been so successful, under a competent director, that at present it apparently has an influence upon the music life of the city since there is a series of concerts for the betterment of civic music given by it each year in one of the large concert halls. Concerts also are given for various large organizations in the city. The company pays all of the expenses, buys some of the instruments, and pays each member 50 cents for each rehearsal. This same company has a choral club of over 100 voices. The regular leader is an employee of the company, but a coach from outside is secured to finish preparing for the concerts, at which quite ambitious programs are presented. One large department store has a number of musical organizations. There is a large choral society, a girls' military band of about 40 pieces, a larger band of the same character among the young men, a girls' and a boys' drum and bugle corps of about 30 members each, and an orchestra of about 35 pieces. Concerts are given by these organizations in the store auditorium. One company having about 1,000 employees has them all assemble once a week at noon for chorus singing under the direction of a leader prominent as a conductor of community singing.

OUTINGS FOR EMPLOYEES.

One hundred and forty-one firms have outings for employees, to which they make some material contribution. These picnics or excursions are often attended both by practically the entire working force and their families as well. Often in very large plants each department of the plant holds its picnic independently. The numbers attending many of these annual outings are very large. Two companies report that about 20,000 attend the company picnic and another has an attendance of 12,000 for which the company pays the transportation and gives the prizes for the games. One company with about 15,000 employees has abandoned the annual picnic because it had grown to unmanageable proportions, and in place of it closes the plant for one day each summer and gives \$1 to each employee. For a picnic attended by 8,000 persons, one company pays the transportation; that of another company attended by about the same number has all the expenses paid by the company, and for one with an attendance of 7,000, refreshments and prizes are furnished. In some cases where amusement parks are used for these outings the companies distribute tickets for the various amusements to each one who attends. One company furnishes transportation and the free use of park amusements to employees and their families, and also

prizes, aggregating about \$100 in value, to the children. Another firm, which has an outing which is largely attended, turns over the management of it to an association of the employees. The company pays for the grounds, prizes, and transportation, and the control of the amusement concessions is given to the girls' club, which receives the profits for its welfare fund. Not until there was a practically unanimous desire evidenced by the employees of one steel mill for an outing was the matter taken up by the management. Committees of the shopmen had charge of all the arrangements and the firm ascribed the great success of these annual affairs to this fact. Much of the success of these outings seems to be due to the fact that they are nearly always managed in a democratic way. This, and the fact that the expense attached is usually so slight as to make it possible for all to attend, contribute to make them one of the most popular forms of recreation found among the companies visited.

CONCLUSION.

It is apparent from much of the work that has been reported along these lines of recreation and of club work that considerable executive ability must be displayed by the employees concerned in the management of these large social affairs, and that the musical and dramatic clubs prove not only that there is much promising material among the rank and file of the workers, but also that these opportunities which are given to them to broaden the scope of their interests and therefore to get away somewhat from the ordinary routine of work must necessarily serve to arouse and encourage their ambition.

MINERS' HOUSING IN SCOTLAND.

It was the Scottish Miners' Federation which was primarily responsible for the investigation of housing conditions in Scotland,¹ and for that reason, if not also because of the magnitude of the mining industry and its importance for Scotland, the Scottish Housing Commission has covered the field of miners' housing very extensively.

As late as the eighteenth century coal miners and salt workers were bound by law to their employers, so that if they left the employer "such deserting colliers as had received 'fair wages and fees' were to be held as thieves and punished in their bodies." The famous and historic woman and child labor commission of 1840 inquired

¹For general summary of the report of the Scottish commission on housing of the industrial classes, see the MONTHLY REVIEW of the Bureau of Labor Statistics for December, 1917, pp. 229 to 234.

somewhat fully into conditions at the mines and in the homes of the miners. Home conditions were described as a "picture of filth and poverty." "The hut is a wretched hovel, perhaps 10 to 12 feet square, in which a family of from 6 to 10 individuals are huddled together."

Some of the present features of miners' housing in Scotland are of note. In the planning of the villages the line of least resistance has been adopted; houses have been built of the cheapest available material and arranged in straight rows placed in parallel lines; there has been a want of provision of garden space in many instances; consideration has not been given to drainage; and houses have been faced upon waste heaps. There are, however, cases where model villages and houses have been provided, but subsequently neglected in upkeep.

The scarcity of gardens can not be accredited to a disinclination for the extra work involved on the part of the miners. The lack is more likely due to other factors, such as (1) short tenure of the dwelling and garden, (2) inadequate fencing, and (3) remoteness of the garden from the house.

Defective roads and footpaths are a characteristic of most mining villages; lighting in many mining towns has been neglected; ashpits are particularly numerous, prominent, and offensive in the older row-house communities. Privy accommodations are declared to be the very worst feature, so much so as to be "an abomination and danger to the community."

The chief causes of defective sanitary provisions are (1) inertia and custom, (2) lack of legal powers of enforcement, and (3) lack of adequate water supply. The latter, however, is undoubtedly the most important factor.

The report expresses no doubt as to the prevalence of overcrowding in the mining regions of the country. There is in these regions a considerably larger proportion of the population living in one and two room houses than elsewhere; and over one-fifth of the population in the mining counties live more than three persons per room, the range in the eight counties being from 21.3 per cent to 39.7 per cent. The committee places the responsibility for overcrowding upon the local authorities, who fail to enforce what powers they have in the matter. Enforcement of existing powers would compel mine operators to erect more and larger houses.

Regarding the size of company houses, no exact figures are available. An estimate for a certain region gave 11 per cent of the total as one-room dwellings, 65 per cent as two-room dwellings, and 24 per cent as dwellings of three rooms or more. This excludes larger

houses of managers and others. In general, a half or more are two-room dwellings and a sixth to a fourth are one-room dwellings.

The report describes the houses as follows:

The typical miner's house has only one story, though in a few recent cases attics have been added, or cottages have been built on the double-flatted principle. In the older rows the houses are commonly "but and ben" or "single end." It is exceptional for them to be built back to back, but even when this is not the case the window in the back wall is either nonexistent or too small to be effective. The more recent rows consist for the most part of "through" houses of two apartments. There is usually a small square lobby inside the door. The kitchen, which also serves as living room, has two bed recesses in the wall opposite the fireplace. Usually these are open for their whole width and height, but may be partially screened by curtains. Opposite the window a door gives communication directly into the "room," which commonly has a fireplace on one side and a single bed place on the other. Dr. McVail estimates the average size of these apartments in the central coalfields as: Kitchen, 15 feet by 10 or 11 feet by 9 feet, its cubic capacity being about 1,400 cubic feet, or with the bed places about 2,000. "The room is of the same width and height, but is probably somewhat shorter from front to back."

Improved houses are slowly taking the place of old and defective houses. The larger houses are appreciated on the whole, though the response to the new standard is not immediate. The housewives are a factor in encouraging improved conditions.

Rents are generally low. The house is looked upon by the miner as a perquisite of his employment. There was a time when the use of the house was a part of the wages, and not even nominal rates were charged. This does not appear in practice to be far removed from the system by which employees have their rent deducted from their wages at the time of payment. Low rents have a bad effect both on the miner and the mine owner. Furthermore, low rents should be considered in the light of the fact that in some mining centers the "standard of habitability" is so low that rent in the ordinary sense does not enter into the minds of colliery owners or the miner tenant. The houses are looked upon as a part of the colliery plant—and that the least expensive for producing as large and remunerative an output as possible.

The proportion of wages paid in rent is usually about one-twelfth to one-tenth, or is even as low as one-seventeenth. The proportion is lower than that paid by store clerks—one-sixth to one-eighth; by skilled workmen in building trades—one-eighth to one-tenth; and by workers in miscellaneous trades—one-ninth to one-tenth. Miners not in company houses pay higher rates in proportion to wages.

The majority of the informants before the commission stated that the miners would willingly pay a higher rent if improved houses were provided. Complaint as to the rent charged was usually connected with a complaint as to the conditions of the house.

Because of these low rents the financial return on miners' houses is small. On 976 workmen's houses built since 1874 by one company in Lanarkshire there was a gross return of £7.167 (\$34,878.21), or 5.57 per cent on a house cost of £128,593 (\$625,797.83). The total annual expenditures amounted to £3,640 (\$17,714.06), or 2.83 per cent of the capital. Expenditures included 0.57 per cent for scavenging, 0.29 per cent for land, 1.15 per cent for taxes, and 0.82 per cent for repairs and materials. If depreciation is allowed for, the return would be reduced to 1.65 per cent. These figures do not take account of the proportion of rental expended in some years for permanent improvements.

Another company built 973 houses containing 1,678 dwellings, returning a gross rental of £5,360 19s. 7d. (\$26,089.20). Here the return is 2.83 per cent or 1.77 per cent after deduction has been made for depreciation.

Cost of upkeep and repair, including taxes, commonly amounts to 50 or 55 per cent of the rental received.

As to the extent of company housing in Scottish mining districts, only scant information is available. For the principal mining county—Lanarkshire—about 38.7 of the houses occupied by miners are owned or leased by the coal companies. Over the mining counties as a whole about 34 per cent of the miners live in company houses.

The policy of company control of housing is briefly adverted to by the commission. It is noted that both employers and employees regard the provision of houses by the employer as the second best course, but in isolated districts at all times, and in all districts for a considerable period before the war, the responsibility has been thrown more and more upon the employer as outside builders have shown no readiness to meet the situation.

As private enterprise has therefore failed to provide the necessary houses either in the mining industry or anywhere else, the commission concludes that the State must assume direct responsibility for housing, for only in that way can the existing shortage be overcome. For the provision of proper housing for miners the observation of town-planning principles in rural districts should be compulsory as at present in urban districts. There should be a limitation upon the number of houses per acre and provision made for garden and recreation grounds. The local authorities, too, should be given power of approval of all water and drainage schemes, introduction of water into houses, and provision of suitable and adequate sanitary conveniences, outbuildings, etc. Furthermore, to secure proper conditions of habitation the rural local authorities should have power to compel the proper maintenance of all premises and, more particu-

larly, to compel the provision of removable rubbish and garbage receptacles. While primary responsibility rests with the employer in the matter of subletting, there is much that the local authorities can do if adequate authority were given to them. The chief difficulty here is that it is in the interest of the employer to connive at overcrowding when there is a shortage of houses and great need of labor.

The recommendations of the minority of the commission do not differ fundamentally nor very greatly from those of the majority. They do not, however, lay as much stress on the evils of the policy of company housing as do the majority. It is suggested that trade-unionism furnishes an adequate safeguard against the misuse of the company house in time of labor disputes.

VOCATIONAL EDUCATION.

ANNUAL REPORT OF THE FEDERAL BOARD FOR VOCATIONAL EDUCATION.

The war has served to emphasize the need for vocationally trained men and women and the want of facilities for vocational training, according to the first annual report of the Federal Board for Vocational Education. To supply the need by making use of such facilities as are available the board has called a meeting for December 19 of those officials in the 48 States to discuss ways and means. In the call it is pointed out that the Army is in need of 200,000 men in 50 different trades. The war, so to speak, has found the United States "*vocationally unprepared.*" It has been the task of the board since its organization late in July of this year to proceed as rapidly as possible to perfect the machinery of cooperation with the States and with the other Federal departments.

The War Department has requested the board to organize courses throughout the country for the training of conscripted men of the second and subsequent drafts. Tuition is free and certificates of efficiency will be issued for the work done. As part of this work the board has organized 50 night schools to train radio and buzzer operators. About 5,000 are enrolled in these classes.

At the request of the Shipping Board the vocational board is now engaged in making a vocational survey of the shipbuilding occupations, analyzing particularly those occupations in outside industries very similar to or almost identical with the shipbuilding occupations. For workers in such occupations little training will be required for fitting them into the shipbuilding industry.

Another war activity to which the vocational board has addressed itself is an investigation into the question of vocational reeducation and placement of disabled soldiers and sailors.

This investigation, which is already well in hand, includes the study not only of the probable number of men thus returned, but also a review of the economic issues involved, a discussion of methods of financing and administering the work of reeducation, an examination of possible agencies and methods of cooperation, and a study of the kinds of workshops necessary to promote further vocational education in these classes. In this task the board has been able to secure the services of experts who have brought to the problem a fund

of special knowledge, without which progress would have been impossible. Plans are under way for cooperation with the Office of the Surgeon General of the War Department.

The board comments, as follows, on the importance of the act creating it:

By far the most important event of the 12 months just passed in vocational education was the passage of the Smith-Hughes Act. This event has marked the beginning of a new era in vocational education in the United States. From now on vocational education is a matter to which the energies of both State and Federal governments will be directed. Its establishment means much for the defense as well as for the prosperity of the people of the country. It means an immediate extension of our secondary public school system so as to furnish practical education for the wage-earning employments. It means, furthermore, that this extension will be carefully planned and ordered. It means an end to haphazard extension of vocational education. It means that a program can be agreed upon and can be developed progressively from year to year.

THE NEGRO WORKER AND HIS EDUCATION.

SUMMARIZED BY W. CARTER RYAN, JR.

The economic, social, and industrial problems inherent in the existence of a racial group of ten millions of Negroes in a nation of a hundred millions are graphically set forth by Dr. Thomas Jesse Jones, of the Phelps Stokes Fund and the Bureau of Education, as the background for his study of Negro education in the United States.¹ This study has been carried on during the past four years, and included personal visits to every private or higher institution for Negroes in the United States.

"Inadequacy and poverty are the outstanding characteristics of every type and grade of education for Negroes in the United States," declares Dr. Jones. He points out, however, that despite all limitations much excellent instruction, through public and private auspices, has been given to the colored people and that they have been able to achieve a degree of progress that speaks well for their future.

Conceding that many leaders of the colored race have been more eager for literary and collegiate instruction than for the teacher-training, agricultural, or industrial instruction that is considered essential, Dr. Jones shows that the educational ideals of the past have everywhere been largely literary and collegiate, especially in the South; that the Negroes have not had the opportunity of observing the increasing attention given to science, industry, and agriculture in education; and, further, that the colored man is naturally suspicious of any departure from the methods and customs which he believes to be still emphasized by his white neighbor. As Dr. Jones says: "The

¹ Negro Education, U. S. Bureau of Education, Bul. Nos. 38, 39. 1916.

various forms of economic bondage to which the Negroes have been subjected by white people seem to them ample evidence for their distrust of any economic feature in their schools."

It may be noted in passing that the Negro is not the only worker who is suspicious of attempts on the part of other groups in society to impose industrial education upon the masses—witness labor's suspicion of certain of the less tactful advocates of the Gary system.

Dr. Jones endeavors to show to the colored people the real possibilities of industrial education as conceived by Gen. Armstrong and advanced by his pupil, Booker T. Washington, namely, adaptation of all education, whether it be literary or industrial, to the needs of the pupil or community. It was the strength of these two men that they regarded industrial and agricultural skill and practical knowledge of household arts as important by-products of the school activities. They kept also in view as the ultimate aim the development of manhood and womanhood through "the common tasks of the common day." Dr. Jones emphasizes the importance of industrial education for the advancement of the Negro in the following significant words:

"No group of people can obtain a satisfactory position in life until they are able to make a reasonable contribution to the economic welfare of their community. The moral and civic status is closely related to the economic. The Negroes are at present overwhelmingly in unskilled occupations. A larger percentage of their women and children are working outside the home than is the case with any other group in the United States. While the race has made real progress in the acquisition of property since the Civil War, a much larger proportion of Negro breadwinners should be prepared to enter the skilled trades and their economic status should be elevated sufficiently to enable the children to attend school and the women to give more time to the moral and hygienic development of the home. Such a development of the Negroes is not only necessary to the welfare of the race but essential to the progress of every Southern State."

NUMBER OF INSTITUTIONS INVESTIGATED.

In all, Dr. Jones's study covered 747 institutions. These institutions are listed and described in Volume II (Bulletin 39), Volume I being reserved for interpretative views of various phases of Negro education. The public facilities for industrial education of Negroes are practically limited to the 16 agricultural and mechanical schools maintained chiefly by Federal funds. It is Dr. Jones's conviction that while most of these institutions are fairly well

equipped to teach the more important trades and to train classes in household arts, only a few of them teach trades effectively. Practically all of them subordinate the industrial training to the literary instruction. Only three cities—Washington, D. C., Charleston, S. C., and Columbus, Ga.—maintain industrial schools for Negroes. There are 13 States which also provide some instruction in industrial courses.

It is largely because of this meager provision by the public authorities that the private industrial schools have thrived. There are 206 private schools that offer some industrial instruction, but the Jones report considers that in fully half of these schools the industrial training is not only limited in quantity but ineffective in result. The work ranges all the way from a small amount of sewing and cooking to the numerous array of trades effectively taught at Hampton and Tuskegee. One item of promise which makes it likely that the public institutions will soon become worthy rivals of the private industrial schools is the appointment of State supervisors of colored schools in 11 Southern States, and county industrial teachers in 163 counties in the South.

AGRICULTURAL TRAINING.

For a people 73 per cent rural, as Dr. Jones points out, vocational training must be largely agricultural. Forty per cent of all persons engaged in southern agriculture are colored. Important as this type of education is to the Negro and to the South as a whole, the facilities are entirely inadequate. The 16 agricultural and mechanical schools maintained with the help of Federal funds have large farms and considerable equipment, but only a small number of them make adequate educational use of the farms or the equipment. There are 56 private institutions with ample farm land on which instruction in agriculture could be given, but very few of them make effective use of their facilities, Hampton and Tuskegee being the only ones where the trades courses are comparable to those in the agricultural colleges for white students.

GENERAL PUBLIC SCHOOL FACILITIES.

According to the Jones report, public schools for Negroes have shared comparatively little in the educational advancement of the past 15 years. At the present time, however, the more progressive southern leaders are realizing that the economic, hygienic, and moral welfare of their sections requires at least the elementary education of the Negro, with proper attention to industrial training and the laws of health. As a measure of the comparative status of public

schools for Negroes, a table of teachers' salaries is presented. From this table it appears that in the Northern and Western States the average teachers' salaries paid for each child 6 to 14 years of age range from \$15.78 to \$36.30 per annum for all pupils, and in the Southern States from \$5.27 to \$13.79 for white pupils and from \$1.44 to \$8.53 for colored pupils. Dr. Jones qualifies his statement with the comment that the South has maintained a double system of schools on finances limited both by the poverty due to conditions arising out of the Civil War and by ineffective systems of taxation. He concludes, however, that "the per capita expenditure for Negro schools, by whatever standard measured, is utterly inadequate."

There is considerable misunderstanding as to the extent to which private funds have supplemented public provision. While private funds have been given with great liberality for colored schools in the South, Dr. Jones shows that the pupils in private schools constitute only 4 per cent of the Negro children 6 to 14 years of age, and 7 per cent of the pupils attending elementary schools. Furthermore, he declares, "Under present conditions in the South many of the private schools are compelled to undertake work that is not suited to their facilities. With an adequate public school system, these private institutions could devote their income and equipment much more effectively to the improvement of the Negro race and, therefore, to the assistance of the South."

IMPORTANCE OF THE NEGRO TO SOUTHERN INDUSTRY.

In the summary section on industrial education Dr. Jones analyzes the welfare of the South and the occupational distribution of Negroes. He shows that the South is rich in economic resources, but poor both in the quantity and the quality of its labor supply and that the industrial education of both the white and the colored youth is undoubtedly the most important element in the economic development of the section. In his view the hope of the South for an improved labor supply is not immigration but effective education both of the white and the colored youth. After all the years of tremendous immigration to America the South had, in 1910, only 726,171 persons of foreign birth, or less than 5 per cent of the total number of immigrants. Special importance attaches to this statement from the threatened emigration to the North. Dr. Jones quotes a prominent North Carolinian as follows:

I believe that the Negro should be educated and that industrial education is what he most needs. But we must not overlook the fact that he has other shortcomings besides that of economic inefficiency. His present condition is not due to a low earning capacity alone, but also to low ideals of living. We

must guard against any kind of one-sided development and bear in mind that the right kind of Negro education is twofold: To increase the Negro's industrial efficiency, and at the same time and with the same speed raise his standard of living. The true type of industrial education not only makes the Negro a better workman, but also causes him to build a better home and live a worthier life.

The report declares industrial education to be of as great importance to the colored people themselves as to the Nation of which they are a part. Notwithstanding the progress that has been made, the Negroes as a race still have a comparatively low economic status. They are as yet "hewers of wood and drawers of water." The only groups forming a substantial proportion of all Negro breadwinners are the laborers, farmers, and laundresses. Other than farmers, no skilled or professional group forms even 1 per cent of the total. It is apparent, therefore, that the possibilities of the race in skilled occupations have only begun. In view of the increased demand of the South for skilled workmen, it is vitally important to the colored people that they grasp every opportunity for industrial education.

College and professional education are also urged by the bureau's report as of real importance to develop trained leaders for the race. Throughout the report the point is made that the object of industrial and other education for the Negro, as for any group, is not merely to make more valuable workmen for industry, but to give men and women the means for upward development. Dr. Jones has carefully pointed out in his section on industrial education that "Great as the economic value of industrial education is, it is by no means equal to the educational value resulting from the interaction of hand and mind in trade activities and from the adaptation of the school curriculum, not only to the economic, but also to the intellectual and spiritual needs of the individual and the community. * * * The broad adaptation to these needs, realized in the effective industrial schools, emphasizes the study of physiology and hygiene, physical science, English, teacher training, sociology, civics, gardening, and other theory and practice required to enable the pupil to be of the greatest service to himself and his neighborhood."

LABOR LAWS.

LABOR PROVISIONS OF THE NEW CONSTITUTION OF THE STATE OF VERA CRUZ.

The new constitution of the State of Vera Cruz-Llave, promulgated on September 16 in Córdoba, the capital, and on October 11 in Vera Cruz, devotes a whole section to the question of labor and the relations of workmen to employers in order to prevent the abuses, especially in the various forms of peonage, which existed in the past. A translation of the section in full follows:

SECTION VII.—*In regard to labor and social welfare (provision).*

ARTICLE 128. The legislature of the State shall issue laws on the subject of labor, which laws shall be based on the requirements of this locality, without violating the following fundamentals, and shall govern the labor of workmen, day laborers, employees, domestic servants, and artisans, and, in general, every labor contract.

I. The duration of the maximum workday shall be eight hours. The maximum working time for night labor shall be seven hours, and the corresponding wages shall be higher than that for day labor by not less than 50 per cent. For this purpose, day labor is understood to be that carried on between the hours of 6 a. m. and 6 p. m., and night labor that carried on between the hours of 6 p. m. and 6 a. m.

II. Unhealthful and dangerous work is forbidden for women in general and for boys under 16 years. Neither may engage in nightwork in factories, and in commercial establishments neither may work after 10 o'clock at night.

III. The maximum work day of children over 12 and less than 16 shall be six hours. The labor of children less than 12 years old shall not be made the object of a contract.

IV. For every six days of work a workman must have at least one day for rest.

V. During the three months prior to childbirth women shall not be employed at labor requiring considerable physical effort. In the month following childbirth it shall be obligatory for them to rest, and they shall receive for this time their entire salary and retain their right to employment and other rights which they shall have acquired under their contract. During the lactation period they shall have two rest periods each day, of one-half hour each, for nursing their children.

VI. The minimum wage which a workman shall receive shall be one deemed sufficient, in view of the conditions in each locality, to satisfy the normal needs of the life of a laboring man, his education and honest pleasures, considering him as the head of a family. In every agricultural, commercial, manufacturing, or mining enterprise the workmen shall enjoy the right of participation in the profits, which shall be regulated as indicated in Section IX.

VII. For equal work there must be a correspondingly equal wage, without taking into account sex or nationality.

VIII. The minimum wages shall be free from distraint, set-off, or discount.

IX. The fixing of the rate of minimum wages and of a participation in the profits to which Section VI refers shall be made by special committees which shall be formed in each municipality and be subordinate to the central board of conciliation which shall be established in the State.

X. The wages must be paid in money that is legally current, and no payment of wages shall be made in merchandise, promissory notes, tokens, or any other substitute for money.

XI. When, under extraordinary circumstances, the hours of a workday must be increased, 100 per cent shall be paid in addition to the wages fixed for normal hours. In no case shall the extraordinary work exceed three hours a day or occur on more than three successive days.

Boys under 16 and women of any age shall not be allowed to do this kind of work.

XII. In every agricultural, manufacturing, or mining business or any other kind of work the employer shall be obliged to furnish the workmen comfortable and hygienic living quarters, for which the rental shall not exceed one-half per cent monthly of the assessed value of the properties.

Schools, infirmaries, and other services necessary to the community shall also be established. If the businesses are located in towns and over 100 workmen are therein employed, the first of these provisions shall be obligatory.

XIII. In addition, in such centers of labor, when the population exceeds 200 inhabitants, a plot of ground of not less than 5,000 square meters shall be reserved for the establishment of public markets, the installation of buildings destined for municipal purposes, and for recreative centers. In every center of labor the establishment of places for the sale of intoxicating liquors and of gambling houses is prohibited.

XIV. The employers shall be responsible for industrial accidents and for occupational diseases of the workmen, suffered because of, or in the exercise of, the work in which they are engaged; in this connection the employers must pay proper indemnity, depending on whether death has resulted or simply temporary or permanent incapacity for work, in accordance with the provisions of the laws. This responsibility shall exist even in case the employer has contracted for the work through a third person.

XV. The employer shall be obliged to observe in the arrangement of his establishment the legal provisions in regard to hygiene and health and to adopt adequate measures to prevent accidents in the use of machines, tools, and working materials, as well as to organize the work in such a way that there may be the greatest guaranty for the health and life of the workmen that may be compatible with the nature of the business, under the penalties which the laws may provide for this purpose.

XVI. The workmen as well as the employers shall have the right to unite in defense of their respective interests by forming syndicates, occupational associations, etc.

XVII. The laws shall recognize strikes and lockouts as a right of the workmen and employers.

XVIII. Strikes shall be lawful when they have as their purpose the securing of an equilibrium between the different factors of production, harmonizing the rights of labor with those of capital. In public employments it shall be obligatory upon the workmen to give notice to the board of conciliation and

arbitration of the state 10 days in advance as to the day fixed for suspending work. Strikes shall be considered as unlawful only when the majority of the strikers perform acts of violence against persons or property, or, in case of war, when they belong to establishments and services which depend on the Government. The workmen in military manufacturing establishments of the Government of the Republic shall not be included in the provisions of this section because they are considered as belonging to the National Army.

XIX. Lockouts shall be lawful only when the excess of production shall make it necessary to suspend work in order to maintain prices within a limit of the cost, previous approval being secured from the board of conciliation and arbitration of the state.

XX. The differences or conflicts between capital and labor shall be submitted to the decision of a board of conciliation and arbitration formed by an equal number of representatives of the laborers and employers with one representative of the Government.

XXI. If an employer shall refuse to submit his differences to arbitration or accept the finding declared by the board, the labor contract shall be considered at an end and he shall be obliged to indemnify the workmen by the payment of the amount of three months' wages in addition to whatever liability may be incurred by him as a result of the conflict. If on the contrary this should be true in the case of the workmen, the labor contract shall be considered at an end.

XXII. An employer who discharges a laborer without good cause, whether for having become a member of an association or syndicate or for having taken part in a lawful strike, shall be compelled, at the election of the workman, to fulfill the terms of the contract or to indemnify him with the amount of three months' wages. Likewise he shall incur this obligation when the workman shall give up his work, due to unfair dealing on the part of the employer or due to the workman's receiving at his employer's hands maltreatment, either of his own person or of that of his wife, parents, children, brothers, or sisters. The employer can not avoid this liability when the ill treatment has been administered by employees or agents who work with his consent or tolerance.

XXIII. Credits in favor of workmen for salary or wages earned during the preceding year and for indemnities shall have preference over any other in case the business goes into the hands of creditors or goes bankrupt.

XXIV. In cases of debts contracted by workmen on account of their employers, their associates, agents, or employees the workman himself shall alone be liable, and in no case and for no reason can the debt be exacted from members of his family, nor shall said debts be collected to an amount in excess of the wages of the workman for one month.

XXV. The service of finding employment for laborers shall be free to them, whether effected by municipal offices, labor exchanges, or any other official or private institution.

XXVI. Every labor contract entered into by a Mexican and a foreign employer must be legalized by the proper municipal authority and viséed by the consul of the nation to which the laborer is to go, with the understanding that in addition to the ordinary clauses it shall be clearly specified that the expenses of repatriation remain a charge on the employer making the contract.

XXVII. The following conditions shall be null and void and shall not obligate the contracting parties even if expressed in the contract:

(a) Those which stipulate a workday that is notoriously excessive when the nature of the work is taken into consideration.

(b) Those which fix a salary which is not remunerative in the judgment of the boards of conciliation and arbitration of the State.

(c) Those which stipulate a period longer than one week for the payment of day wages.

(d) Those which designate a place of recreation, a restaurant, café, tavern, saloon, or shop for paying wages except in the case of employees of such establishments.

(e) Those which embody a direct or indirect obligation to purchase articles of consumption in determined shops or places.

(f) Those which permit the retention of any part of the wages as a fine.

(g) Those which constitute a waiver on the part of the workman of the indemnities to which he is entitled because of industrial accidents or occupational diseases, damages for nonfulfillment of a contract, or for a discharge from work.

(h) All other stipulations which imply a waiver of some right vested in the workman by labor laws.

ARBITRATION AND CONCILIATION.

CONCILIATION WORK OF THE DEPARTMENT OF LABOR, NOVEMBER 16 TO DECEMBER 15, 1917.

Under the organic act of the department, which gives the Secretary of Labor the authority to mediate in labor disputes through the appointment, in his discretion, of commissioners of conciliation, the Secretary exercised his good offices between November 16 and December 15, 1917, in 55 labor disputes. The companies involved, the number of employees affected, and the results secured, so far as information is available, were as follows:

STATEMENT SHOWING NUMBER OF LABOR DISPUTES HANDLED BY THE DEPARTMENT OF LABOR, THROUGH ITS COMMISSIONERS OF CONCILIATION, NOV. 16 TO DEC. 15, 1917.

Name.	Workmen affected.		Result.
	Directly.	Indirectly.	
Strike, Atlas and Lakeside foundries, Detroit, Mich.....	200	3,500	Commissioner learned this was a matter for Department of Justice.
The Wm. F. Taubel Hosiery Works, Inc., Riverside, N. J.	381	619	Company had* secured 230 women to take place of strikers. Most of strikers have obtained work elsewhere.
Controversy, Consolidated Coal Co., Frostburg, Md.....	90	275	Adjusted.
Controversy, machinists, Plainfield, N. J.....	2,000		Management of company does not anticipate trouble unless brought about by business agents.
Strike, sizers and formers, John B. Stetson Co., Philadelphia, Pa.	1,235		Pending.
Strike, Morse Twist Drill Co., New Bedford, Mass.....	920	1,360	Do.
Strike, Bear Creek Lumber Co., Leakesville, La.....	250		Adjusted.
Lockout, carpenters, Naul Construction Co., Wilmington, N. C.	49		Do.
Controversy, Machinery Belt Workers, N. Y.....	273	50	Do.
Threatened strike, Eckhart Mines, Frostburg, Md.....	90		Pending.
Strike, railway clerks, Denver & Ft. Worth R. R. Co., Ft. Worth, Tex.	73	176	Adjusted.
Strike, machinists, American Woodworking Machinery Co., Aurora, Ill.	135	160	Pending.
Threatened strike, Emmonds Coal Co., Bayard, W. Va...	175		Do.
Controversy, firemen, Passaic and Garfield, N. J.....	400	13,000	Do.
Strike, clerks and freight handlers, 9 railroads and 5 steamship lines entering Norfolk, Va.	2,790	3,500	Do.
Controversy, Cincinnati, Indianapolis & Western R. R. Co. and its carmen, Indianapolis, Ind.	150	200	Adjusted.

STATEMENT SHOWING NUMBER OF LABOR DISPUTES HANDLED BY THE DEPARTMENT OF LABOR, THROUGH ITS COMMISSIONERS OF CONCILIATION, NOV. 16 TO DEC. 15, 1917—Concluded.

Name.	Workmen affected.		Result.
	Directly.	Indirectly.	
Strike, Lawrence Silk Mills, Paterson, N. J.			Adjusted.
Strike, bayonet straighteners, Remington Arms Co., Bridgeport, Conn.	52		Do.
Strike, Lake Torpedo Boat Co., Bridgeport, Conn.			Pending.

Controversy, Coal & Coke R. R. Co., Gassaway, W. Va.	185		Adjusted.
Controversy, Chicago, Rock Island & Pacific R. R. Co. and United Brotherhood of Carpenters and Joiners, Rock Island, Ill.			Pending.
Strike, shirt manufacturing industry, Mahoney City, Pa.			Do.
Controversy, Brotherhood of Railway Carmen and Southern Pacific R. R. Co., Los Angeles, Cal.			Do.
Controversy, Tintic mine owners and employees, Eureka, Utah.	1,500		Do.
Controversy, Chicago & Great Western R. R. Co. and its shop crafts, Oelwein, Iowa.			Do.
Contract for electrical work, building leased by Government, St. Louis, Mo.			Do.
Controversy, Crucible Steel Co. and Northern Iron Co., Port Henry and Standish, N. Y.			Do.
Controversy, International Arms & Fuse Co., Bloomfield, N. J.			Do.
Controversy, Hercules Powder Co. and metal trades-unions, Chula Vista, Cal.			Do.
Strike, J. Ring and Sons, Philadelphia, Pa.			Do.
Controversy, meat cutters, Kansas City, Mo.			Do.

¹ All clerks on system.

Cases noted as pending in statement of November 15 have been disposed of as follows:

Strike, clerks, Atlantic Coast Line Railroad Co. Adjusted.

Strike, American-British Mfg. Co., Providence, R. I. Adjusted.

Controversy, Pacific States Telephone & Telegraph Co. and its electrical workers, involving California, Washington, Oregon, Idaho, and Nevada. Adjusted.

Controversy, Pacific Steamship Co. and International Longshoremen's Union, San Diego, Cal. Adjusted.

Threatened strike, blacksmiths, Texas Shipbuilding Co., Bath, Me. Adjusted.

Threatened strike, blacksmiths, Bath Iron Works, Bath, Me. Adjusted.

Controversy, Port Newark Terminal, Newark, N. J. Strike order rescinded; men returned to work pending investigation and adjustment.

Controversy, longshoremen and employing stevedores, San Pedro, Cal. Adjusted.

Controversy, oil and gas well workers and oil operators, California. Adjusted.

Lockout, Seaton Garment Co., Princeton, Ind. Plant removed to Olney, Ill., prior to commissioners' arrival.

Threatened strike, machinists, Cleveland, Cincinnati, Chicago & St. Louis R. R. Co. (Big Four), Indianapolis, Ind. Adjusted.

Controversy, mechanical crafts, Toledo & Cincinnati division, Baltimore & Ohio R. R. Co. Adjusted.

Controversy, Kelly-Springfield Tire Co., Akron, Ohio. Adjusted.

Walkout, ship carpenters, McBride & Law shipyards and Beaumont Shipbuilding Dry Docks Co., Beaumont, Tex. Men returned to work pending decision from Washington regarding universal wage scale of 62½ cents per hour.

Strike, machinists, Burns Bros.' Garage, N. Y. Burns Bros., who are in the coal business, use automobiles for making deliveries. They maintained a shop where their automobiles were repaired and in which only seven men were employed. When the men quit they closed the shop and are now having their work done by the manufacturer from whom they buy.

Strike, Nestor Manufacturing Co., New York. Unable to adjust.

REPORT OF THE UNITED STATES BOARD OF MEDIATION AND CONCILIATION.

The act creating the United States Board of Mediation and Conciliation was approved July 15, 1913. The board is concerned in the settlement of labor disputes arising in transportation; it takes jurisdiction over conductors, engineers, and trainmen. The board is not required to make reports of its activities, "but in view of the extreme gravity of the railroad situation, and because the relation of the railroads and their employees is a prime factor in that situation," the board has deemed it advisable to issue a report of its operations.

During the four and a half years of its existence the board has given its services in 71 controversies. Of these, 52 were completely settled by mediation, 6 partly by mediation and partly by arbitra-

tion, 8 wholly by arbitration, 3 by parties themselves, and one by congressional action, while only one remains unsettled.

Since June 30, 1917, there have been 13 additional controversies before the board, of which 5 have been fully settled by mediation, 1 by mediation and arbitration, 3 are under arbitration at present, and 4 are in various stages of mediation.

"In no instance has a strike followed the intervention of the board," it is noted, although any one of the disputes handled by the board was sufficiently serious to threaten the interruption of service on the roads involved. The experience of the board is highly favorable to the method of mediation as a means of settling labor disputes. "It seems to be the best plan yet devised for bringing to a peaceful settlement the disputes which most frequently occur." Settlements by mediation, it is added, "are much more satisfactory to the parties than any form of mediation," because they are secured by the common consent and to the mutual satisfaction of the parties. "There is no decision against either party, and neither of them suffers defeat."

AWARD OF BOARD OF ARBITRATION IN NEW YORK HARBOR WAGE ADJUSTMENT.

The following award was made under date of November 16, 1917, by the Board of Arbitration, New York Harbor Wage Adjustment, United States Shipping Board, in regard to wages and working conditions of employees engaged in the operation of tugs, barges, lighters, ferryboats, and other harbor marine equipment in the port of New York, also river vessels engaged in carrying on the commerce of the port of New York.

Whereas on October 20, 1917, representatives of owners and operators of tugs, barges, lighters, ferryboats and other harbor marine equipment in the port of New York did sign an agreement with the United States Shipping Board as follows:

"We, the undersigned owners and operators of tugs, barges, lighters, ferryboats and other harbor marine equipment in the port of New York, hereby agree with the United States Shipping Board that, during the period of war, we will submit all differences concerning wages or conditions of labor involved in the operation of such marine equipment which can not first be adjusted by the employers and the employees to the decision of a Government board of three men, to be appointed as follows: One by the United States Shipping Board, one by the Department of Commerce, and one by the Department of Labor.

"This Government board shall have no authority to pass upon the question of open or closed shop, or the recognition of unions, but we agree that there shall be no discrimination of any kind against union men, and the board shall have power to determine questions of discrimination."

And whereas representatives of labor employed in the operation of tugs, barges, lighters, ferryboats, and other harbor marine equipment in the port of New York, did on the same day enter into an agreement with the Shipping Board as follows:

"We, the undersigned representatives of labor employed in the operation of tugs, barges, lighters, ferryboats, and other harbor marine equipment in the port of New York, hereby agree with the United States Shipping Board that during the period of the war, we will submit all differences concerning wages or conditions of labor involved in the operation of such marine equipment, which can not first be adjusted by the employers and the employees, to the decision of a Government board of three men, to be appointed as follows: One by the United States Shipping Board, one by the Department of Commerce, and one by the Department of Labor.

"This Government board shall have no authority to pass upon the question of open or closed shop or the recognition of unions, but there shall be no discrimination of any kind against union men, and the board shall have power to determine questions of discrimination; and pending the decision of said board work shall continue uninterruptedly."

And whereas under the agreements above cited a board of arbitration, New York Harbor Wage Adjustment, United States Shipping Board, was appointed as contemplated in the above agreements, to wit: Capt. William B. Baker, of the United States Army, was appointed by the Shipping Board; Ethelbert Stewart by the Department of Labor, and George R. Putnam by the Department of Commerce, and this board having elected Capt. William B. Baker as its chairman and having considered all material evidence in the case, hereby announce to all parties concerned, as its award, the following:

I.—HARBOR AND RIVER TUGS AND PASSENGER VESSELS PROPELLED BY STEAM, OTHER THAN THOSE HEREINAFTER DESIGNATED AS FERRYBOATS, LIGHTERS, AND TIDEWATER BOATS.

(a) MINIMUM WAGE SCALE.

Deck department.

Captains: The minimum rates of pay of captains shall be based upon the equivalent single cylinder diameter of the engine with which boat is equipped, as follows:

	Per month and board.
10 inches up to and including 15 inches_____	\$125.00
Over 15 inches and including 18 inches_____	135.00
20 inches and over_____	145.00
Licensed mates or pilots required to navigate the boat_____	125.00
Licensed mates on tugs doing transport work_____	100.00
Licensed deck mates on passenger and excursion vessels, not engaged in the handling or navigation of boat_____	90.00
First deck hands, two crew boats_____	65.00
Deck hands, other than first, two crew boats_____	60.00
Deck hands, when there is but one such employee during period of 24 hours_____	65.00

	Per month and board.
<i>Engine department.</i>	
Engineers: Rates graduated on same basis as for captain, as follows:	
10 inches up to and including 15 inches.....	\$115.00
Over 15 inches and including 18 inches.....	125.00
20 inches and over.....	135.00
Assistant engineer: \$10 less per month than engineer on same class of boats.	
Night engineer: When in charge and doing the same class of work as is required of day man, the pay shall be the same as the day engineer.	
Oilers.....	65.00
Firemen, where two or more are employed.....	60.00
Firemen, where there is but one such employee during period of 24 hours.....	65.00
<i>Other employees.</i>	
Cooks on craft employing more than one deck hand in 24 hours.....	
	\$60 per month and board.
Cooks on craft employing but one deck hand in 24 hours.....	
	62 per month and board.
Float men.....	60 per month and board.

(b) WORKING CONDITIONS.

1. Where maintenance or subsistence is not furnished the above employees, 60 cents per day or \$18 per month shall be allowed in lieu thereof.
2. The length of day is to be governed by the Federal law.
3. One day off each week with pay shall be granted to all employees, the day to be determined by the employer.
4. One full week's vacation with pay shall be granted to each of the above employees who has been in the employ of one company for a period of one year or more.
5. Car fare to be paid by employers when boats are to change crews at other than a designated point.
6. Employers and employees are urged to reduce overtime to a minimum, but when overtime is required such overtime shall be paid for at time and one-half.

II.—FERRYBOATS.

(a) MINIMUM WAGE SCALE, ALL WITHOUT BOARD.

	Per month.
<i>Deck department.</i>	
Captains or pilots.....	\$160
Wheelmen.....	80
Deck hands.....	70
<i>Engine department.</i>	
Engineers.....	150
Oilers, required to have U. S. marine engineers' license.....	85
Oilers, not required to have U. S. marine engineers' license.....	80
Firemen.....	80

(b) WORKING CONDITIONS.

1. One day off each week with pay shall be granted to all the above-named employees, the day to be determined by the employer.

2. One full week's vacation with pay shall be granted to each of the above-named employees who has been in the employ of the company for a period of one year or more.

III.—TIDEWATER BOATS, THAT IS, COAL BOATS, GRAIN BOATS, OR OPEN-DECK SCOWS.

There is hereby established a minimum monthly rate of \$70 without board for captains.

IV.—LIGHTERS AND BARGES NOT INCLUDED UNDER III.

There is hereby established the following minimum monthly rates for captains:

- | | |
|--|---------|
| (a) For barges having heavy steam hoisting gear of 15 tons capacity and over----- | \$90.00 |
| (b) For barges having light steam or gasoline hoisting gear of less than 15 tons capacity----- | 85.00 |
| (c) For covered barges and barges with hand hoisting gear----- | 77.00 |

For watching at night, if required, \$1 per night shall be paid for covered barges, loaded barges where man is not required to be on deck and unloaded barges, and \$1.50 per night per man where man is required to be on deck.

All car fares in excess of 10 cents to be paid by the employers for men within the metropolitan district, and all car fares to be paid by employers when on company business.

Nothing in this award shall be construed to decrease the pay or allowance, or to increase the hours of labor now in effect, or that were in effect on or prior to November 1, 1917.

All wage rates, allowances, and working conditions provided for in this award shall be effective as of November 1, 1917.

(Signed) W. B. BAKER, Captain, U. S. A.,
Chairman, representing U. S. Shipping Board.

(Signed) G. R. PUTNAM,
Department of Commerce.

(Signed) ETHELBERT STEWART,
Department of Labor.

STRIKES AND LOCKOUTS.

STRIKES AND LOCKOUTS IN GERMANY, 1916.¹

The August issue of the journal of the German Department of Labor Statistics (*Reichs-Arbeitsblatt*) gives a summary of the figures relating to labor disputes in 1916. These numbered 240 (all of which were strikes) and involved 124,188 workpeople. As will appear from the following table the labor disputes of 1916 show a considerable advance on 1915, both as regards the number of persons involved and the number of days lost; on the other hand, the days lost in 1916, both actually and in relation to the number of disputes, were much fewer than the average for the five years immediately preceding the outbreak of the war.

Year.	Number of disputes.	Number of work-people directly involved.	Number of working days lost.
1909-1913 ¹	2,595	327,593	11,190,494
1914.....	26	95,140	2,843,895
1915.....	141	12,866	45,511
1916.....	240	124,188	245,404

1 Average.

The groups of trades affected most seriously by the 1916 disputes, taking the estimated number of days lost as the criterion, were mining (100,121 days lost), metal (37,900), and engineering (5,307). In these three groups together the aggregate loss in working days amounted to 58 per cent of the total lost in all trades combined. From the point of view of the workpeople 27 (or 11.3 per cent) of the disputes were fully successful, 130 (54.2 per cent) partly so, and 83 (34.5 per cent) wholly unsuccessful.

In a notice of the report referred to above the Berlin journal *Soziale Praxis* of 23d of August makes the suggestion that the value of the statistics issued by the Imperial Statistical Office would be enhanced if they were secured through the cooperation of the trade-unions rather than (as now) through returns collected by the police authorities.

¹ The Labour Gazette, London, November, 1917, p. 403.

IMMIGRATION.

IMMIGRATION IN SEPTEMBER, 1917.

The number of immigrant aliens admitted to the United States during the year 1916 was 355,767, as compared with 258,678 for the year 1915, an increase of 97,089, or 37.5 per cent. There was also an increase from month to month during 7 of the 12 months in 1916. During the current year the figures for the first three months show a considerable decrease from month to month. The decrease from the preceding month for January, February, and March, 1917, is 19.9, 22.3, and 19.4 per cent, respectively. For April, however, the number of immigrant aliens admitted shows an increase of 32.3 per cent over the number admitted in March. As compared with April, the figures for May show a decrease of 48.9 per cent. The figures for June indicate an increase of 5.5 per cent over those for May. During July immigration reached a very low point, only 9,367 immigrant aliens having been admitted, a total even smaller than that for May, which was the smallest total for any month in many years. As compared with figures for July, however, those for August show an increase of 7.3 per cent. In September the number fell to 9,228, or 139 smaller than the number admitted in July. As compared with August the figures for September show a decrease of 8.2 per cent. These facts are brought out in the following table:

IMMIGRANT ALIENS ADMITTED INTO THE UNITED STATES IN SPECIFIED MONTHS
1913 TO 1917.

Month.	1913	1914	1915	1916	1917	
					Number.	Per cent increase over preceding month.
January.....	46,441	44,708	15,481	17,293	24,745	19.9
February.....	59,156	46,873	13,873	24,740	19,238	22.3
March.....	96,958	92,621	19,263	27,586	15,512	19.4
April.....	136,371	119,885	24,532	30,560	20,523	32.3
May.....	137,262	107,796	26,069	31,021	10,487	48.9
June.....	176,261	71,728	22,598	30,764	11,095	5.5
July.....	138,244	60,377	21,504	25,035	9,367	15.6

PUBLICATIONS RELATING TO LABOR.

OFFICIAL—UNITED STATES.

MARYLAND.—[*State Industrial Accident Commission*]. *Reports of cases under the Workmen's Compensation Act, decided by the State Industrial Accident Commission and the court of appeals of Maryland, from November 1, 1914, to September 1, 1916, inclusive. Vol. 1. Edited and reported by J. Lloyd Harshman, legal director to the claim bureau. Baltimore. [1917.] 316 pp.*

MASSACHUSETTS.—*Bureau of Statistics. Seventh annual report on union scale of wages and hours of labor in Massachusetts, 1916. Labor bulletin No. 120. Boston, 1917. 136 pp.*

This is the seventh of a series of annual reports issued by the Bureau of Statistics relative to the time rates of wages (i. e., wages agreed upon in return for services for a specified period) and hours of labor in the organized industries and trades of Massachusetts, the data being obtained principally as of October 1, 1916. Authority for the data presented was derived in most cases from information furnished by organizations of employees, the exceptions being in steam and electric railway service, and in telephone, telegraph, and Federal service, where the information was furnished by the employers. The report states that of the 1,427 local unions known to be in existence on October 1, 1916, 943, or 66.1 per cent, are represented in the returns. The aggregate membership of these 943 local unions was 152,988, or 58.2 per cent of the aggregate membership of the 1,427 local unions in the State on that date. It is estimated that at least 50 per cent of the aggregate number of trade-union members in the State were working on a standard time-rate basis, and that the total membership of local unions whose members were reported as working either on a time-rate basis or a piece-price basis was approximately 85.1 per cent of the aggregate membership of all local unions in the State. The report is almost entirely statistical.

PENNSYLVANIA.—*Annual report of the State Workmen's Insurance Fund. Harrisburg [1917]. 29 pp.*

This report is noted on pages 162 to 164 of this issue of the MONTHLY REVIEW.

UNITED STATES.—*Board of Mediation and Conciliation. Report of December 8, 1917. Washington, 1917. 3 typewritten pages.*

This report is noted on pages 229 and 230 of this issue of the MONTHLY REVIEW.

— *Department of Labor. Fifth annual report of the Secretary of Labor. Fiscal year ended June 30, 1917. Washington, 1917. 159 pp.*

This report is noted on pages 40 to 47 in this issue of the MONTHLY REVIEW.

— *Children's Bureau. Governmental provisions in the United States and foreign countries for members of the military forces and their dependents. Prepared under the direction of Capt. S. Herbert Wolfe, Q. M., U. S. R. Bureau publication 28. Washington, 1917. 237 pp.*

UNITED STATES.—*Federal Board for Vocational Education. Annual report, 1917. Washington, 1917. 31 pp.*

* This report is noted on pages 217 and 218 of this issue of the MONTHLY REVIEW.

— — — *Statement of policies. Bulletin No. 1. Washington, 1917. 70 pp.*

This bulletin presents a summary of the policies, preliminary and tentative, thus far agreed upon by the board for administering the Smith-Hughes Act, which provides a scheme of cooperation between the Federal Government and the States for the promotion of vocational education in the fields of agriculture, trade, home economics, and industry. Part I includes general policies or standards adopted by the Federal Board; Part II includes principally rulings upon and a discussion of points raised at the hearings given to the State boards for vocational education held in Washington in August. This discussion falls under four general subheads: Considerations of a general nature, agricultural education, industrial and trade education, and home-economics education. In addition to the policies the bulletin contains in the appendix an analysis of what may be termed the absolute legal requirements of the Smith-Hughes Act. The appendix also contains a copy of the act of February 23, 1917 (Public No. 347, 64th Cong.), and statistical tables showing amount of grants to the States which will be available if the States comply with the requirements of the act.

— — — *Shipping Board. First annual report, Dec. 1, 1917. Washington, 1917. 36 pp.*

Bearing somewhat upon the subject of vocational education is that portion of the report relating to the recruiting and training of officers and engineers and crews for the greatly enlarged merchant marine in prospect. The first work taken up was the training of deck officers, men already trained by experience in seamanship being taken and given a short intensive period of training in special navigation schools under the direction of the recruiting service. In five months no less than 15,000 men have applied for such training. Twenty-seven navigation schools have been established, the teaching staff including sea captains as well as teachers from scientific schools and technical universities. For admission to the schools a minimum of two years' experience at sea is required, and during the schooling they receive no compensation from the Government and no allowance for expenses. The next work to be given attention has been the training of engineers. During the period from June 1 to October 31 there were graduated from the navigation schools 604 men and from the engineering schools 416 men.

OFFICIAL—FOREIGN COUNTRIES.

ARGENTINA.—*Boletín del Departamento Nacional del Trabajo. No. 34. May, 1916. 235 pp.*

A continuation of an investigation of the economic condition of Indians living in the Federal territories of Chaco and Formosa. The report deals with the efforts of the State and of early missionaries among the aborigines along the line of education and instruction in useful labor; family relations; State regulations in force in Indian stations; agricultural labor; religion and superstition, etc., of the various tribes; expenses and income of stations, and recommendations made by the investigator.

AUSTRALIA.—*Official Statistics, Commonwealth of Australia. Production Bulletin No. 10. Summary of Commonwealth production statistics for the years 1905-1906 to 1915-1916. Commonwealth Bureau of Census and Statistics. Melbourne, 1917. 168 pp.*

This is the tenth bulletin relating to production, issued by this bureau. The information given is presented under 11 heads, and a summary. Statistical tables relate to agriculture, mining, and manufacturing.

NUMBER OF FACTORIES AND EMPLOYEES, AMOUNT OF WAGES PAID, VALUE OF RAW MATERIALS USED, VALUE ADDED, AND VALUE OF OUTPUT, IN AUSTRALIA, 1907, 1910, 1913, AND 1915.

All employees.....	\$376.28	\$423.68	\$506.80	\$525.58

¹ Industrial establishments in which at least 4 hands are employed or in which power other than hand is used.

² Not separately reported.

The per cent of male employees over female employees was as follows: In 1907, 48.6; in 1910, 46.8; in 1913, 50.8; and in 1915, 50.1.

In 1910, the number of persons under 16 years of age employed in factories formed 4.86 per cent; in 1913, 4.08 per cent; and in 1915, 4.72 per cent of all persons so employed.

AUSTRALIA (NEW SOUTH WALES).—*Department of Labor and Industry. Report on the working of the Factories and Shops Act, 1912, during the year 1916. Sydney, 1917. 62 pp.*

A report on the administration of the Factories and Shops Act for the year ending December 31, 1916, with summaries showing the number of factories registered, persons employed, and horsepower of machinery used in the various districts.

Statistical tables and charts show the number and percentages of employees, classified by sex and age.

CANADA.—*Department of Labor. Labor legislation in Canada for the calendar year 1916. Ottawa, 1917. 102 pp.*

These laws are compiled by provinces and cover the general subjects of labor departments and bureaus; wages; holidays and rest days; regulation and inspection of factories and coal mines; employment of women and children; workmen's compensation; examination and licensing of workmen—apprenticeship; vocational training; mothers' pensions; housing; protection of civil and property rights of persons on active service; loans and financial aid for settlers; and prison labor.

— — — *Seventh annual report on wholesale prices, 1916. Ottawa, 1917. 295 pp.*

Presents a summary review and analysis of the price changes of the year, followed by the actual statistics of prices, the latter being divided into two parts: (1) The weekly or monthly quotations for each article through 1916; and (2) tables of average annual prices back to 1890 reduced to the form of index numbers. Appendix A gives a summary of average retail prices in over 50 Canadian cities; Appendix B contains a review of the course of prices in 1916 in other countries. The following table of index numbers shows the upward trend of wholesale prices in Canada at certain specified times, 1890 to 1916:

INDEX NUMBERS SHOWING TREND OF WHOLESALE PRICES AT CERTAIN DATES,
1890 TO 1916.

[1890 to 1899=100.]

Date.	Index number.
1890 ¹	110.3
1895 ¹	95.6
1900 ¹	108.2

CHILE.—*Central Statistics Bureau. Statistical Abstract of the Republic of Chile, 1916. Santiago de Chile, 1917. x, 150 pp.*

This volume contains the usual information found in statistical yearbooks. In 1915 there were, exclusive of minor manufacturing establishments, 2,406 manufacturing establishments reported furnishing employment to 7,371 clerical employees and 45,551 wage earners. Of the wage earners 31,093 were men, 11,025 were women, and 3,433 were children. The most important industry is food preparation, constituting nearly one-half the value of all production.

CUBA.—*Secretaria de Hacienda. Sección de Estadística. Industria Azucarera y sus Derivadas. Habana, 1917. 106 pp. Charts.*

A compilation of data relative to the sugar production in Cuba in the harvest of 1915-16 and foreign sugar trade in 1916. The number of plantations in

operation and the exportations in 1916 were greater than any year for which comparable figures are given. The amount exported in 1915 and in 1916 was 2,523,597 and 2,890,138 tons, respectively. Of the total of 3,068,437 tons of production, less than 1,000 tons were refined. According to estimates made by the chief of the bureau of statistics the production of 1917 will exceed 3,500,000 tons.

FRANCE.—*Ministère du Travail et de la Prévoyance Sociale. Statistique Générale de la France. Annuaire Statistique. Trente-quatrième volume, 1914-1915. Paris, 1917. lvi, 494, 239* pp.*

This report contains statistical information on climatology, movement of population, production, income and expenses, administration, and colonial statistics, with comparable data for a series of years.

GREAT BRITAIN.—*Board of Trade. Report upon the accidents that have occurred on the railways of the United Kingdom during the year 1916. London, 1917. 6 pp.*

This report is presented under three general heads: (1) Train accidents; (2) accidents caused by the movement of trains and railway vehicles exclusive of train accidents; and (3) fatal accidents on railway premises not due to train accidents or to the movement of trains and railway vehicles. The following table is a general summary of all accidents:

NUMBER OF PERSONS KILLED OR INJURED ON THE RAILWAYS OF THE UNITED KINGDOM IN 1916, COMPARED WITH 1915, SHOWING PER CENT OF INCREASE OR DECREASE.

Group.	1915 ¹		1916		Per cent of decrease 1916 from 1915.	
	Killed.	Injured.	Killed.	Injured.	Killed.	Injured.
1. Train accidents:						
Passengers.....	2 269	21,432	3	350	98.9	75.6
Servants.....	9	183	12	182	³ 33.3	.5
Other persons.....		2	1	17		³ 750.0
2. Accidents caused by the movement of trains and rail- way vehicles, exclusive of train accidents:						
Passengers.....	162	4,355	147	1,195	9.3	49.3
Servants.....	403	4,962	402	5 3,519	.2	29.1
Other persons.....	521	334	427	326	18.0	2.4
3. Accidents on railway prem- ises not due to group 1 or 2:						
Passengers.....	6	708	9	(6)	² 50.0	
Servants.....	59	21,202	7 39	(6)	33.9	
Other persons.....	40	562	26	(6)	35.0	
Total.....	1,469	31,740	1,066	5,589	27.4	³ 39.7

¹ Data taken from the report for 1915, which was noted in the Monthly Review for October, 1916, p. 101.

² This figure is large because of 1 accident in which 227 persons were killed and 246 were injured.

³ Increase.

⁴ 6 were servants of contractors and not of railways.

⁵ 16 were servants of contractors and not of railways.

⁶ Data not given.

⁷ 3 were servants of contractors and not of railways.

⁸ Based upon the totals of groups 1 and 2 only.

INDIA.—*Department of Mines. Report of the chief inspector for the year ending 31st December, 1916. Calcutta, 1917. 96 pp.*

This report is divided into five sections: (1) Persons employed; (2) Output of minerals; (3) Accidents; (4) Prosecutions and additions to the acts; (5) General remarks. Data in two of these sections are of particular interest to labor, namely, the number of persons employed in the mines, and the number of accidents during the year 1916. There were, according to the report, 197,919 persons working in and about the mines in 1916, 124,770 of these being adult

males, 66,855 being adult females, and 6,294 being children under 12 years of age. This is an increase of 17,831 workers, or 9.9 per cent, over the preceding year. Those employed in coal mines numbered 143,459, a decrease of 2,078 from 1915.

During the year there were 140 accidents causing fatalities, a decrease of 23 as compared with 1915. These accidents involved a loss of 206 lives (168 males and 38 females), which is stated to be the largest since 1913. Most of these deaths (82 per cent) occurred at coal mines. Forty-six persons lost their lives by falls of roof, 35 by falls of side, 29 in shafts, 14 by explosions of fire damp, 12 by haulage, 4 by explosives, 3 by irruption of water, 7 by other accidents underground, and 56 by accidents on the surface. The death rate per 1,000 persons employed was 1.04, while that of the preceding five years was 1.10. At coal mines these figures were 1.18 and 1.24, respectively. The death rate per million tons raised at coal mines was 10.29, while that of the preceding 5 years was 10.87. By way of comparison the report notes that at coal mines in England, during the 10 years ending and including 1914, the death rate per 1,000 persons employed varied from 1.08 to 1.69, while the death rate per million tons raised, in the same period, varied from 4.31 to 6.37. The percentage of increase in the output of the principal minerals, 1916 over 1915, was as follows: Coal, 0.41; manganese, 50.02; mica, 45.36; salt, 10.77; wolfram (a tungstate of iron and manganese), 49.86; limestone, 29.43 (decrease); gold, 4.46 (decrease); copper ore, 66.65 (decrease).

INDIA.—*Department of Statistics. Prices and freights after three years at war. Calcutta, 1917. 7 pp.*

This report shows wholesale and retail prices in Calcutta, index numbers of retail food prices in other countries, and the rise in freights. States that the wholesale prices of commodities in Calcutta at the end of July, 1917, were 42 per cent higher than at the outbreak of the war, and that the general level of retail prices of foodstuffs in Calcutta showed a rise of 16 per cent as compared with the period just before the war began. The increase in retail prices since July, 1915, was 7 per cent and since July, 1916, 5 per cent. The following table shows the unweighted index numbers of the principal food commodities at the end of July, 1917, as compared with July, 1915, and July, 1916, prices at the end of July, 1914, being taken as the base, or 100.

UNWEIGHTED INDEX NUMBERS OF FOOD PRICES AT THE END OF JULY, 1917, AS COMPARED WITH 1915 AND 1916.

RUSSIA.—*Federal Department of the Russian Confederated States. Pensions and aid to soldiers of the ranks and their families. Code of laws and decisions with official explanations up to November 1, 1915, and interpretation edited by the Judicial Commission of the Several Russian United Towns. Moscow, 1916. xxi, 309 pp.*

— *Izdatie Sostoyashchego pod Argusteishim cya Imperatorskago Velichestva Gosudaryni Imperatritsy Aleksandry Teodorovny Predsedatelstvom Verkhornago Soveta po Prizreniyu Semei lits Prezvanni na Voinu, a takzhe Semei Raneny e Parshikh Voinov. Code of laws, decisions, etc., relative to assistance to soldiers of the ranks and their families, up to January 1, 1916. Collected by the Chancellor's Office of the Supreme Council, and published by the Imperial Printing Office, Petrograd, 1916. li, 873 pp.*

SWITZERLAND.—*Bureau des Assurances. Rapport sur les Entreprises Privées en Matière d'Assurances en Suisse en 1915. Berne, 1917. 116*, 201 pp.*

This volume contains reports of the operations of the various insurance associations operating under Government concession, and subject to supervision.

Twenty societies are engaged in accident insurance proper, while 6 others operating as insurance companies in Switzerland do no industrial insurance business, having concessions for other lines of risks only. There are in addition, a large number of cooperative associations and societies engaged in accident insurance which are not subject to the supervision of the Federal Government.

The premiums collected by 25 of the companies mentioned above amounted to 130,683,212 francs (\$25,221,860). The amount disbursed for accident compensation and annuities, including unpaid claims due and premiums returnable, was 78,782,946 francs (\$15,205,109); general expenses amounted to 43,517,090 francs (\$8,398,798); reserve to 86,214,718 francs (\$16,639,441).

Of the 25 for which reports are complete relative to profit and loss, 20 were operated at a profit of 14,542,511 francs (\$2,806,705) and 5 at a loss of 1,338,420 francs (\$258,315).

— *Département de l'économie publique. Rapports des gouvernements cantonaux sur l'exécution de la loi fédérale concernant le travail dans les fabriques 1915 et 1916. Aarau, 1917. 122 pp.*

In this volume factory statistics for the various provinces are reported, including dispensations granted relative to overtime and holiday work, nature and duration of industrial accidents, and their compensation, number of infractions of the labor laws, and number of industrial establishments in operation.

UNION OF SOUTH AFRICA.—*Department of Mines and Industries. Annual report of the Government mine engineer for the calendar year ended 31st December, 1916. Pretoria, 1917. 108 pp. 30 tables.*

States that the value of minerals produced during the year 1916 was £50,593,359 (\$246,212,581.57), or an increase of 16.22 per cent over 1915, the largest increase being in the value of diamonds mined, namely, 1,332.8 per cent. The numbers of persons in the service of mines and works during December, 1916, were 32,000 whites, 4,190 Asiatics, and 280,515 natives and other colored persons, the total being an increase of 5.78 per cent over 1915. The earnings of those employed in mines and works were as follows: Whites, £9,657,060 (\$46,996,082.49); Asiatics, £134,145 (\$652,816.64); natives and other colored persons, £7,714,456 (\$37,542,400.12); the total being £17,505,661 (\$85,191,299.25), or an increase of 10.24 per cent over 1915. There were 2,942 accidents during the year, 808 being fatal and 2,134 nonfatal. The average number employed during 1916 was 289,629, making the death rate 2.79 per 1,000 employed, as compared with 2.93 in 1915. The death rate was lowest in the diamond mines, being 0.67, and highest in the metalliferous mines, being 2.99. The death rate

in coal mines was 2.05. The compensation paid by or on behalf of mines in respect of 674 death claims was £45,275 (\$220,330.79); 3,575 injury claims, £78,682 (\$382,905.95); the total, £123,957 (\$603,236.74), being an increase of 5.18 per cent over the amount paid in 1915. The average paid per claim was \$326.90 for death, and \$107.11 for injury.

UNOFFICIAL.

AMAR, JULES. *Le moteur humain et les bases scientifiques du travail professionnel*. Paris, H. Dunod et E. Pinat, 1914. 622 pp. Illustrated.

This volume, by the director of the research laboratory for vocational work at the National Conservatory of Arts and Trades, and doctor of sciences, is an endeavor to bring together the elements of physical and physiological research in their relation to vocational work in a text which is sufficiently technical to be a complete exposition of the subject and sufficiently concise to appeal to the general reader. It covers briefly the results of studies which have been made upon the subject of the mechanical and physiological conditions of human labor, from the work of Coulomb in 1785, including the work of Chauveau and Taylor, up to the recent developments in the methods of measuring muscular work and fatigue. The volume is divided into six books under the heads of: Ideas of general mechanics; the human machine; human energy; the man and his medium; experimental technique; and vocational work. The subject is developed from a survey of the laws of mechanics applied to the human body and their relation to physical constitution and environment, waste and repair, fatigue and rest, to a discussion of the technique of experimentation and the instruments used for measuring the dynamic power of the human machine and evaluating its energy, and finally to the test of such experimental work applied to vocational labor. The relation between labor and wages, which is naturally raised by a discussion of increasing the output of the workman, is touched upon only incidentally, the author stating that it is outside the range of the present volume. The work contains a preface by Henry le Chatelier, member of the Institute, general inspector of mines, and professor at the Sorbonne and at the high school of mines, and is honored by a subscription from the ministers of labor and of commerce.

— *Organisation physiologique du travail*. Paris, H. Dunod et E. Pinat, 1917. 374 pp. Illustrated.

The reeducation of the wounded, although not suggested by the title, is the objective of this work by Prof. Amar. The first two-thirds of the book, with a preface by Henry le Chatelier, reviews the history, methods, and results of such experiments in the scientific study of human labor as seem to have practical bearing upon this reeducation, under the heads of: Human work, history and doctrines; organic functions of man; human psychophysiology; work and fatigue; the factor of work; the art of working, physical activity, intellectual activity; apprenticeship; and manual labor.

The remaining third of the book has been expanded from an address on "La prothèse et le travail des mutilés," delivered by Prof. Amar before the Conference on Work for the Wounded, January 12, 1916. It is devoted to a study of the reeducation of the disabled and their restoration to industry, which work the author divides into three stages: Functional reeducation, scientific prosthesis, and vocational reeducation. Methods of functional reeducation and apparatus of prosthesis which are successfully used by Prof. Amar in his work with the wounded are described and illustrated and mention made of the

schools for such reeducation which are already existent and those under consideration.

Speaking of the work already accomplished, the author says, "In the special circle of the wounded we have seen the return to a normal life made possible for the very great majority of the infirm, the debilitated, the less seriously disabled, and about 80 per cent of the wounded to the number of more than 2,500,000 in Europe to-day."

In regard to the placing of disabled men in industrial positions, Prof. Amar thinks that, while all available means should be utilized, still "it is indispensable that there should be a central organization comprising all the machinery of control and coordination. * * *

"Such seems to be the decision of Parliament, since it has given to the Minister of Labor the mission of organizing vocational reeducation in France. In this way a formidable waste of time and money may be avoided. When the schools are well under way and the proper placing of men assured, it will not be two years before all of our wounded who are susceptible of reeducation will be at least earning their own living without being in debt to anyone."

AMERICAN ACADEMY OF POLITICAL AND SOCIAL SCIENCE. *Annals*, vol. 74. *The world's food*. November, 1917. 313 pp.

Proceedings of the conference on the world's food held by the academy in Philadelphia in September, 1917. The papers are grouped as follows: Part I. The world's food: (a) Introductory; (b) The food situation with the neutrals; (c) Food for the allies; Part II. Food utilization and conservation: (a) A basis for individual and national diets; (b) Food conservation and utilization; Part III. Production and marketing plans for next year; Part IV. Price control. The discussion of conditions abroad includes papers on Great Britain, France, Japan, South America, Switzerland, Norway, Sweden, and Holland. Attention is given to the essentials of a safe diet and the dangers of too narrow restriction. The volume includes the report of the Food Inquiry Committee of Philadelphia on the trend of real wages in that city.

AMERICAN ASSOCIATION FOR LABOR LEGISLATION. *Standards for workmen's compensation laws*. Revised to November 1, 1917. 131 East 23d Street, New York City. [1917] 12 pp.

Outlines the essential features that, it is believed, should be incorporated in all compensation laws in the interest of uniformity, as well as of justice to workers. Suggestions are given on the following general subjects: (1) Scale of compensation; (2) Employment to be included; (3) Injuries to be included; (4) Other remedies than those provided by the compensation act; (5) Security for the payment of compensation awards; (6) Organization of accident board; (7) Procedure for settlement of compensation claims; (8) Reports of accidents; (9) Rehabilitation.

BOGEN, BORIS D. *Jewish philanthropy: An exposition of principles and methods of Jewish social service in the United States*. New York, Macmillan, 1917. 391 pp. Bibliography.

Practically a revision of a course of lectures on Jewish philanthropy given for the past six years at the Hebrew Union College, Cincinnati, Ohio, and constituting "a statement of the principles evolved through the experience of the last two decades in various philanthropic efforts of the Jews of this country." Treats, among many subjects, of immigration, distribution, transients, insufficiency of income, and education.

BYERS, LIEUT. J. R., C. A. M. C. *Fighting tuberculosis. Military Hospitals Commission. Ottawa [1916]. 24 pp.*

This pamphlet has been written for the benefit of Canadian soldiers who are suffering from lung diseases and is put out by the Military Hospitals Commission. Only general principles and conditions are dealt with. After describing the battle to be fought by a soldier who is threatened or attacked by tuberculosis, a number of rules are given for his guidance which are summed up in the concluding paragraph of the pamphlet:

Remember, always, that the four great factors in the cure of lung diseases are rest, fresh air, good food, and cleanliness of mind and body.

CARNEGIE UNITED KINGDOM TRUST. *Report on the physical welfare of mothers and children. Liverpool, 1917. Four volumes (No. III not out). Illus.*

The report of a survey undertaken in 1916 by the Carnegie United Kingdom Trustees "because the rate of infantile mortality, with its predominant causes, and the health supervision of children from infancy to the age of admission to school are, in their opinion, among the most important questions of the present day relating to the well-being of the people."

CARTER, HUNTLY. *Industrial reconstruction: A symposium on the situation after the war and how to meet it. London, T. Fisher Unwin (Ltd.). 1917. 295 pp.*

The papers in this symposium, edited by Huntly Carter, are the result of an inquiry undertaken to ascertain the opinions held by a large number of distinguished public persons on one of the greatest problems Great Britain must face after the war. Most of them were first published in *The New Age*. They present the State view, the views of capital, labor views, economic views, and general views, the last taking up the question from the standpoint of sociology, psychology, logic, philosophy, religion, art and craft, law, and politics.

COLUMBIA UNIVERSITY. *How Canada organized her man power, by J. D. Sears. Columbia war papers, No. 14. New York, Division of Intelligence and Publicity of Columbia University, 1917. 11 pp.*

Tells of the work of the National Service Bureau of the Dominion in making an elaborate survey, inventory, mobilization, and organization of the human and industrial forces of the nation, describing how the information has all been card indexed. Mentions also the fact that a census is being taken of the occupations and trades of the soldiers at the front, and that a survey is being made of the industries and resources of Canada, with a view to placing returned soldiers in proper employment.

CONNOLLY, JAMES. *Labor in Ireland: Labor in Irish history and The Reconquest of Ireland. Dublin and London, Maunsel, 1917. 346 pp. Price 4s. net.*

James Connolly was one of the leaders of the Irish insurrection of Easter Monday, 1916, and he is described by Mr. Robert Lynd, who contributes the introduction, as "Ireland's first socialist martyr."

"Labor in Irish history," first published several years ago, is described by its author as "an explanation of the position of labor in the great epochs of our modern history, and with the attitude of Irish leaders toward the hopes, aspirations, and necessities of those who live by labor." In the foreword to "The reconquest of Ireland," published in 1915, he writes: "The underlying idea of this work is that the labor movement of Ireland must set itself the reconquest of Ireland as its final aim, that that reconquest involves taking possession of the entire country, all its powers of wealth-production and all its natural resources, and organizing these on a cooperative basis for the good of all."

DAWSON, WILLIAM HARBUTT, ed. *After-war problems, by The Earl of Cromer and others.* London, George Allen & Unwin (Ltd.). 1917. 366 pp.

Following an introduction by the editor, William Harbutt Dawson, the problems which Great Britain will have to face after the war are discussed under four heads: (1) Empire and citizenship; (2) National efficiency; (3) Social reform, and (4) National finance and taxation. Of particular interest to labor are papers on the State and industry, the State and labor, the relations between capital and labor, the position of women in economic life, and housing after the war.

EUBANK, EARLE EDWARD. *Loan sharks and loan-shark legislation in Illinois.* New York, Russell Sage Foundation, 1917. 16 pp.

Summarizes the findings of a survey, by the department of public welfare, of the loan-shark situation in Chicago in 1916, one result of which was the improved law which went into effect July 1, 1917.

GARDNER, LUCY, ed. *The hope for society: Essays on social reconstruction after the war, by various writers.* London, Bell, 1917. 236 pp.

Essays given in the form of lectures at the summer school of the Interdenominational Conference of the Social Service Unions held in Swanwick, England, in 1916. Includes, among others, Industrial and financial position after the war, by J. A. Hobson; Trade-union regulations: Employer's view, by Sir Hugh Bell; Trade-union regulations: The trade-union view, by Rev. Dr. A. J. Carlyle; Position of women in industry, by Margaret Bondfield; Development of the agricultural side of English life, by Christopher Turnor; and Land question after the war, by C. Roden Buxton.

HAMP, PIERRE. *La France, pays ouvrier.* Paris, Nouvelle Revue Française, 1916. 66 pp. 3d ed. Price 2 fr. 50c. net.

An outlook upon the work of French workmen after the war, based upon a brief review of the conditions which have led to the present relation of the French artisan to his trade, and the changing influences of to-day occasioned by the introduction of new machinery, methods, and ideas into French labor. It concludes with an optimistic view of the outcome of all factors in the development of labor when "France, the fighting country, shall emerge France, the working country."

HOWE, FREDERIC C. *The high cost of living.* New York, Scribner's, 1917. 275 pp.

An indictment of the existing system of monopoly and a brief for Government ownership of the railroads. The steps necessary to secure freedom of production and distribution are said to be the following:

To organize shipments from the farm; to have public ownership of terminal markets, local markets, and local abattoirs; to have (1) public receiving stations for milk or (2) city operation of the sale of milk; and Government ownership of railroads.

INSTITUT INTERNATIONAL D'AGRICULTURE. SERVICE DE LA STATISTIQUE GÉNÉRALE. *Annuaire international de statistique agricole 1915 et 1916.* Rome, 1917. 949 pp. Price, 10 fr.

Report on agricultural statistics of all countries for the past 10 years by the International Institute of Agriculture, Rome, Italy. Deals with area and population, productive and nonproductive areas, acreage and yield of crops, live stock, imports and exports, consumption, prices, fertilizers and chemical products useful in agriculture, ocean freight rates, and rates of exchange. The table of contents is in five languages, but text and tables are in French.

KELTIE, J. SCOTT, ed. *The statesman's yearbook: Statistical and historical annual of the States of the world for the year 1917*. London, Macmillan, 1917. 1504 pp.

MAYOR MITCHEL'S FOOD SUPPLY COMMITTEE. [NEW YORK CITY]. *Hints to housewives*. 71 Broadway, New York City, June, 1917. 112 pp.

This pamphlet contains chapters on how to buy; how to care for food; meats; drippings and butter substitutes; substitutes for meat; fish; vegetables; cereals; bread; how to use left-overs; how to make soap; fireless cooker; canning fruits and vegetables; how to preserve eggs. It has been issued in the belief that if every housewife will carefully read, study, and put into everyday use the suggestions made, "she will not only be helping to reduce the high cost of living for her family and her neighbors, but will be rendering a distinct patriotic service to her country in this critical time." It aims to show how every housewife may do her part toward solving the food problem by simplifying the meals she serves and by seeing to it that not one bit of food is wasted.

MERCHANTS' ASSOCIATION OF NEW YORK. GREATER NEW YORK. *Bulletin*, Vol. VI, No. 43. Nov. 26, 1917. 16 pp.

This issue contains an extended account of how British industry was adapted to the war, being a summary of what the committee from the British Ministry of Munitions had to tell the manufacturers of the United States, with a selection of questions asked and answers given by the committee. It quotes the Treasury agreement entered into the Government, capital, and labor, which was embodied in the Munitions of War Act, 1915, giving the Minister of Munitions power to control factories engaged in the manufacture of munitions; binding labor to accept certain wages and permitting no fluctuation upward or downward in the wages except by consent of the Minister of Munitions; making strikes and lockouts illegal and arbitration compulsory; and including a waiver by labor of all practices and customs which tended to restrict either employment or output, in return for which the Government pledged itself to restore prewar conditions in shops after the war. The summary states that, as a result of this agreement, there has been no strike for higher wages since the war began, and only three strikes which may be regarded as serious. It recites the experience of Great Britain in bringing about economy of raw material and of man power by a system of licenses and by laws, in preventing the shifting of labor from one establishment to another, and in the employment of women to take the places of men.

— *Industrial Bureau*. *Results of an inquiry into the effect of the war upon the employment of women in places formerly filled by men in New York City*. 1 p.

This investigation, it is stated, was made at the request of members of the merchants' association, who are or who expect to be confronted with a shortage of labor, the purpose being to supply answers to the following questions:

To what extent are female employees being substituted at the present time?

To what extent do employers expect that such substitution will be necessary in the future?

In general, on what types of work, not now ordinarily performed by females, are they satisfactory?

Are wages paid females the same as for males in the same or similar positions, provided production is the same in both quantity and quality?

What problems, if any, arise from the employment of females in positions ordinarily filled by male workers?

The report does not offer any opinions relative either to the desirability of substituting female labor or as to what methods should be employed; it is simply a summarization of the opinions of employers who have made such

substitution, this information being obtained by correspondence, by interviews, and by replies to a questionnaire from 160 employers of labor in New York City and vicinity. It appears from this report that, although a great many women are employed in various occupations, there has been very little substitution, only 35, or 21.9 per cent, of the 160 who reported on this question, stating that they are now using female workers more extensively than formerly, while only 9, or 5.6 per cent, have placed any large number of women in positions formerly filled by men exclusively. "The concern which is substituting females exclusively is still a rarity."

The report points out, however, a tendency to increase the employment of women in business irrespective of the situation created by the war, and that some employers who have formerly employed a few women in occupations also filled by men are now hiring women exclusively as vacancies occur. Nearly all employers reporting substitution of women also reported that the same wages are paid to them as were formerly paid to men. Some employers reported the operation of a distinctly different wage schedule for men and women, ignoring the policy of equal pay for equal work, but not necessarily paying lower wages to women than to men. Some problems confronting the employment of female labor where such labor is used to replace men were found to center about questions of management and changes in factory organization and in production methods. Following are the most frequent causes of such problems reported by employers:

Laws regulating the hours, time, and conditions of labor. These prevent women from working under the ordinary conditions existing in many plants.

The greater liability of women for accidents due to style of dress, as well as to physical causes. Frequently women are required to wear sleeve holders and caps to cover the hair. Additional safety appliances must be installed on machines.

The necessity of further specialization of labor, particularly where women operate machines. Women are machine operators and not mechanics, and therefore special occupations need to be created for men as helpers, machine repairers, and adjusters.

The necessity for special machinery or machine parts adapted to operation by females.

The necessity for substituting mechanical appliances, as conveying machinery, to minimize physical exertion.

MOORE, HARRY H. *The youth and the Nation: A guide to service.* New York, Macmillan, 1917. 179 pp. Illustrated.

"An attempt to arouse a wholesome interest among young men and older boys of college and high-school age in modern social evils, to show them how men have combatted these evils, and to suggest vocational opportunities in the warfare against them."

MORE, ADELYNE. *Fecundity versus civilization: A contribution to the study of overpopulation as the cause of war and the chief obstacle to the emancipation of women, with special reference to Germany.* London, Allen & Unwin, [1917.] 64 pp. Bibliography. Price 1s. net.

NATIONAL AMALGAMATED UNION OF LABOR [GREAT BRITAIN]. *Report and balance sheet for quarter ending June 30, 1917.* Newcastle-on-Tyne; Richard Mayne, 1917. 66 pp.

States that the membership at June 30, 1917, was 101,436, or a gain during the quarter of 10,421; and also that the financial balance at that time was £52,930 1s. 8d. (\$255,784.25). Refers to a "new development in the relationships of unions of lesser skilled workmen" resulting in the formation of the National Federation of General Workers with which has been merged the previously

existing General Laborers' National Council. The objects of the new federation are stated to be:

The provision of facilities for questions of common interest being dealt with from a common center under the auspices of the federation, such questions to embrace: (1) Wages movements covering the interests of more than one union; (2) the condition of women's labor; (3) matters affecting the interests of affiliated unions which are directly under the control of Government departments; (4) the collection and distribution of information of common interest to the unions; (5) the maintenance of greater harmony amongst the members and officials of the affiliated unions.

NATIONAL CONFERENCE OF COMMISSIONERS ON UNIFORM STATE LAWS. *Report of the committee on occupational diseases to the twenty-seventh annual meeting of the national conference of commissioners on uniform State laws, to be held at the Grand Hotel, Saratoga, N. Y., August 29 to September 3, 1917. Second draft of a uniform occupational diseases act. [1917]. 16 pp.*

Largely taken up with a draft of a uniform occupational diseases act, being supplemental to the uniform workmen's compensation act. Includes a schedule of 28 occupational diseases, with description of the nature of the work or process which causes each disease.

ROCKEFELLER, JOHN D., jr. *The personal relation in industry. New York, 1917. 43 pp.*

An address delivered at Cornell University. The speaker expresses his belief that "the personal relation in industry will eventually be regarded as an important part of those college courses which aim to fit men for business life."

UNIONIST SOCIAL REFORM COMMITTEE. *The Health of the People—A new national policy. London, Argus Printing Co., Ltd. [1917], 63 pp.*

This is the report of a committee of Unionist members of Parliament which made, in 1913 and 1914, inquiries into housing, education, agriculture, industrial unrest, and poor-law reform. Although admittedly incomplete, since the activities of the committee have been interfered with by the war, the report has been issued at this time because of "the war wastage of man power and of the social and economic requirements of the future, as well as of the ignorance of the public concerning the administrative chaos connected with public health." It aims to show that "public health is purchasable"—that "efficient health legislation and control is, from the most strictly financial and businesslike point of view, a national investment producing the most liberal returns for work and money."

In the opening chapter the theory of public health is set out, the purpose being to show, by the quotation of statistics, the economic loss through disease and the possibility of reducing this loss by proper means of prevention and control brought about by a simple and businesslike organization. It is an economic argument for health reform. Emphasis is laid upon the necessity for reducing infant mortality in order to conserve adult health. In this connection Lord Rhondda, in a statement made as president of the local government board, said: "The examination I have been able to give to the subject * * * has convinced me that by proper coordination of the health activities of various agencies and the application of modern scientific methods it is not too much to hope that a thousand infant lives may be saved every week which are now needlessly lost."

The existing system of supervision of national health is described in considerable detail, revealing "uttermost complexity and dislocation," and apparently

indicating that "the system needs recasting from top to bottom." The arrangements by which the supervision of public health is distributed among six Government offices "constitute a guaranty of practical waste and inefficiency."

In considering the question of the reorganization of the central departments, the committee declares that eventually all health matters ought to be placed under a single department, but states that it is content at the present time to recognize the general view that a health department dealing with health in the most comprehensive sense attainable should be constituted, believing that in process of time the health functions of other departments will be transferred to it. The report then outlines what is to be expected of such a department.

WALDO, FULLERTON L. *Good housing that pays: A study of the aims and the accomplishments of the Octavia Hill Association, 1896-1917.* Philadelphia, Harper Press, 1917. 126 pp. Illus.

An intimate account of the pioneer model housing association in the United States, organized in Philadelphia in 1896 for "holding, selling, and leasing real estate." The association began with 5 properties valued at \$10,500, and at the close of 1916 owned 179 properties valued at \$276,026.63. This includes a considerable accession of property made in 1916, when it purchased the majority stock of the Philadelphia Model Homes Co. It works on a business basis, although content with a small dividend. The chief feature of its work lies in the rent collector, that "patient universal arbiter" who not only collects rent but gives domestic advice, settles neighborhood quarrels, and acts as welfare worker among the tenants.

The association manages renting properties for others; it had 17 such properties in 1898 and 228 in 1916. It employs salaried workers, the highest salary paid being \$200 a month. Its monthly salary bill is \$518.33.

MONTHLY REVIEW

OF THE

U. S. BUREAU OF LABOR STATISTICS

VOL. VI—NO. 2

WASHINGTON

FEBRUARY, 1918

COST OF LIVING IN THE DISTRICT OF COLUMBIA.

FIFTH ARTICLE—WAGE-EARNING WOMEN: THEIR CLOTHING.

Cost of living studies have ascertained quite definitely the amounts and the costs of the principal articles of food consumed by the average workingman's family. Scientific dietary studies have laid down generally accepted standards of the kinds of food and the expenditure necessary to feed a family or an individual so as to maintain health and a reasonable degree of comfort. No corresponding standards in regard to clothing have ever been made. The task of working out standards of the kinds, the qualities, the quantities, and the cost of clothing indispensable for an average workingman's family or for individual workers in different occupations is well-nigh impossible. Very few attempts to set up such minimum clothing standards have ever been made, and these attempts have been confined to estimating the needs of working women. Even when so narrowed in scope, the task of setting up minimum standards of clothing requirements for working women presents very great difficulties because of wide variations in individual taste, in knowledge of materials and styles, in opportunities to buy advantageously, in capacity to make and mend garments, and in ability to consume clothes with the minimum of wear and tear. One woman can not feel decently dressed unless her head is adorned with a hat in the latest mode. Another woman will cut down on other items of expense in order to clothe her feet in silk hosiery and the latest and most astonishing things in shoes. Truly what is one woman's extravagance is another woman's economy, which brings confusion to those who wish to standardize clothing expenditures. One woman possesses the ability to sew, and by making her own clothing can dress well at much less expense than the woman who must buy all her clothing ready-made. Another woman possesses the inclination to mend and to "make over." Still

another possesses the faculty of good management and is capable of judging between wise and unwise selection even at bargain sales.

There is, however, one factor which remains fairly constant in its effect on clothing plans and expenditures. This is the occupational requirement. The standard of dress established for different occupations is scarcely a question of choice with the wage earner, but is determined by the environment in which she must work. The clothing requirements of the factory worker, laundry worker, stenographer, and saleswoman are very different. The majority of occupations open to women in Washington are those of the store and the office. The standards of dress imposed upon clerks, stenographers, and salesgirls are relatively high, and therefore in Washington a larger proportion of wage-earning women than in other cities must make a smart appearance in dress in order to feel themselves decently clothed.

Of all forms of conspicuous waste and competitive display, extravagance in dress is perhaps the most tempting and the hardest to resist. The American people, especially American women, are being almost constantly lectured about their extravagance in dress. It does not seem probable, however, that many of the wage-earning women who furnished detailed schedules of expenditures for clothing to the Bureau of Labor Statistics had been guilty of the sin of extravagance, as 42 out of the 53 spent less than \$150 a year on clothes. All right-thinking people condemn extravagance. It is very difficult, however, to determine what constitutes extravagance in dress. The "creations" in form and color which are made by manufacturers and offered for sale by retailers point to the need for a Clothing Administrator to protect the public from involuntary extravagance and conspicuous ugliness and discomfort in dress. It does not seem clear that the working women themselves should be left unaided to cope with the style makers in solving the problems of what constitute sufficiency, comfort, and commendable adornment in dress, and what amount should be spent each year, on the average, to attain these ideals.

It does seem essential that emphasis be laid on the importance, especially to the working girl, of becoming clothes of good quality, kept scrupulously neat and clean. Expenditures for clothing of the right kind are really an investment on the part of the wage-earning woman. Self-respect and success in life depend in large measure upon proper clothes.

A SPECIAL STUDY OF CLOTHING EXPENDITURES.

As part of the present investigation into the cost of living in the District of Columbia an effort was made to ascertain, as nearly as

possible, the necessary cost of clothing for working women in different occupations. As noted above, most of the women wage earners in Washington are engaged in occupations such as store, office, and Government service, which require standards of dress somewhat higher than those existing in mill towns or industrial sections of manufacturing cities.

Thus, in considering the question of clothing costs, it seemed reasonable to limit attention to women engaged as saleswomen, clerks, stenographers, and in occupations of this character. Also it seemed desirable to limit this special analysis to strictly self-supporting women, living away from home, and between the ages of 19 and 35 years. The great majority of working women fall between these ages, and it is at that period of life that the character of her dress is of vital importance to the average woman whether or not she is at work.

Out of the total of 600 women covered by the investigation there were 53 who fell within the limitations mentioned and for whom information in sufficient detail was obtained to permit of careful analysis.

Eighteen of these 53 women were employed in stores, 17 in Government work, 13 in business offices, and 5 in telephone offices. Most of them were living as boarders in working girls' homes, private families, or boarding houses; but a few were renting rooms separately and doing their own food purchasing and cooking.

The total yearly incomes—including earnings, incomes from other sources, and gifts of new clothing—of these 53 women ranged from \$258 to \$1,096, and their yearly expenditures for clothing ranged from \$22 to \$260. The following table shows in detail the clothing expenditures of these women, classified by income groups:

CLOTHING EXPENDITURES OF 53 WOMEN FOR THE YEAR 1916.

Annual income.	Number of women.	Number spending on clothing per year—							
		Under \$25	\$25 and under \$50	\$50 and under \$75	\$75 and under \$100	\$100 and under \$125	\$125 and under \$150	\$150 and under \$200	\$200 and over.
\$200 and under \$300.....	4		3	1					
\$300 and under \$400.....	5		1	3	1				
\$400 and under \$500.....	9	1		1	2	3	2		
\$500 and under \$600.....	13			2	3	3	3	1	1
\$600 and under \$700.....	7			2	2		3		
\$700 and under \$800.....	7				2			2	
\$800 and under \$1,100.....	8						1		5
All groups.....	53	1	4	9	10	6	12	5	6

It is evident from this table that, even with a fairly homogeneous group of women, there are wide variations in the amount spent for

clothing. Thus, of the 13 women listed in the \$500 to \$600 income group the clothing expenditures varied from \$50 to \$75 at one extreme to more than \$200 at the other extreme.

These variations in expenditures measure more or less accurately the degree in which these women were well or badly clothed. And an analysis of not only what these women spent, but also of what they got for the money, throws light on the question of the expenditure essential to maintaining a condition of dress that may be described as one of physical comfort, social decency, and agreeable outward appearance.

The following comments on this subject, it is to be emphasized, are based primarily upon the experience and opinions of the particular group of women referred to, verified to some extent by a study of store prices. The information was secured through the formal schedule obtained from each woman, supplemented in many cases by later interviews to secure data regarding the length of time clothing of different qualities may reasonably be expected to be worn, and also to secure expressions of opinion as to what they considered necessary in order to feel themselves well dressed. The prices quoted are those which were in force in 1916 and the early part of 1917.

THE COST OF BEING WELL DRESSED.

The majority of women, whose incomes are small, whose credit accounts are limited, and whose deficits, if incurred, must be met by themselves, are forced to keep their expenditures for clothing at about the same figure year after year. With some articles of clothing a system of purchases in alternate years is possible, but in the present study of the clothing expenditures it was found that, for almost all women, expenditures for the following items of dress repeat themselves each year: Hats, shoes, gloves, stockings, corsets, underwear, and certain miscellaneous articles. These items must be bought every year, the amount of "hold-over" being quite small. One woman, who, because of a \$150 doctor bill, was able to spend only \$22 for clothing, expended a small sum on each of these items except underwear, which was carried over from the previous year.

With outer clothing, such as suits, coats, sweaters, dresses, shirt waists, and dress skirts, the same uniformity of expenditure does not exist. For some of these items the plan of alternate years of purchase is a very satisfactory arrangement. Many of these women are highly skilled in the art of making their clothes last, but not a little complaint was heard that clothing bought nowadays does not have the wearing qualities of that bought a few years ago.

In order to allow for the optional factor, a consolidation has been made of these variable items under the heading "outside clothing,"

which includes suits, coats, sweaters, dresses, shirt waists, and dress skirts. The following table shows the average amounts spent by these 53 women for "outside clothing" and also for the separate items of dress which are common to all women and of which, as a rule, a supply must be purchased each year.

AVERAGE YEARLY EXPENDITURE FOR ITEMS OF CLOTHING, BY INCOME GROUPS.

Annual income.	Number of women.	Outside clothing (suits, coats, sweaters, dresses, waists, dress skirts).	Other articles of dress.							All clothing.
			Hats.	Shoes.	Gloves.	Stockings.	Corsets.	Underwear.	Miscellaneous.	
Under \$300.....	4	\$19.78	\$5.19	\$7.59	\$0.77	\$2.74	\$2.25	\$3.13	\$2.99	\$44.42
\$300 and under \$400...	5	32.63	4.45	7.10	1.23	3.42	1.91	4.62	8.80	64.15
\$400 and under \$500...	9	45.80	9.33	12.06	3.19	6.02	2.48	7.11	10.79	96.77
\$500 and under \$550...	8	47.50	10.31	13.50	2.88	5.53	4.13	5.22	9.99	99.35
\$550 and under \$600...	5	72.48	13.80	16.69	4.46	6.20	2.30	7.05	19.21	142.19
\$600 and under \$700...	7	57.55	12.71	14.29	2.62	3.88	2.93	6.37	7.42	107.77
\$700 and under \$800...	7	66.78	13.47	16.71	5.32	6.89	3.79	11.39	16.82	141.17
\$800 and under \$1,100..	8	99.34	19.06	21.25	6.00	7.25	6.06	9.94	32.23	201.13
All groups.....	53	57.58	11.59	14.20	3.32	5.53	3.41	7.18	14.27	117.49

In the income groups under \$400, the average expenditure for every item of clothing is below that which would permit of physical comfort and decency. Among the women with annual incomes from \$400 to \$800, considerable differences are found in the average amounts spent for "outside clothing" and miscellaneous items, but the average amounts spent for hats, shoes, gloves, stockings, corsets, and underwear vary only slightly between groups.

OUTSIDE CLOTHING.

Suits and coats.—The majority of working women consider a suit a necessity. Twenty-eight of the 53 women had expenditures for suits in 1916, and from later interviews with women on this subject it would appear that the others were wearing suits which were brought in 1915 or earlier. In these interviews the opinion was general that it was not economical to buy suits lower in price than \$25, and many felt that it was better economy to pay from \$30 to \$35. Among those who bought suits in 1916, 8 paid between \$16 and \$20 (suits evidently marked down), 10 paid from \$25 to \$32.50, and 5 paid over \$32.50. Most of the women interviewed on the subject were fairly well agreed that a suit of average price (\$25 to \$30) could reasonably be expected to last two years, and some reported that they wore suits of a higher price for three years.

The practice of buying suits and coats in alternate years seemed to be agreed upon in theory, if not always carried out in actual prac-

tice. The prices paid for coats ranged from \$25 to \$40, and they are worn from two to three winters. As a general rule, the women seemed to be able to wear coats longer than suits, barring radical changes in style. Some women planned to alternate the purchase of spring suits with winter coats. Others bought winter suits, and lightweight coats or sweaters. This latter was possibly a cheaper arrangement, but from the standpoint of health and comfort is less commendable, as every woman needs a warmer wrap for extreme weather than is furnished by a suit coat.

Shirt waists.—The black and white, or dark blue and white clothing required by the principal stores, which usually applies to the office force as well as to the saleswomen, creates a great demand for white shirt waists. Most of the women reported that six to eight white waists, for which they paid \$1 to \$1.50 each, were required for a season, with no assurance that they would last over until the beginning of the next season. Others bought about the same number at \$2.50 to \$3 each, and expected them to wear for two years. Still others bought one or two rather expensive silk waists, which could be washed easily, and would wear for one or two years. Aside from work waists, almost every woman planned to have at least one dress waist, perhaps of georgette or crêpe de chine, to wear with her suit. For this she usually paid from \$5 to \$8. Very often this waist was worn with her suit to theaters and parties, thereby taking the place of an evening dress. Thus, shirt waists for the average woman may reasonably be expected to cost from \$6 to \$15 a year.

Dresses and skirts.—When a suit is made to wear two years, one additional skirt or a one-piece dress was regarded as almost a necessity. Such a skirt usually cost from \$5 to \$10 and was worn not less than two years. One-piece dresses, however, were worn by the majority of girls, who expected a dress which cost about \$15 to last one season.

The one-piece dress for summer was used by some women, but more common was the wearing of separate white skirts with white waists. The choice in white skirts varied from one \$6 to \$7 white corduroy skirt for dress wear, which will last two to three years, to three or four wash skirts at \$2 to \$3 which will wear for one season and possibly for two.

The question of afternoon and party dresses is highly individual. One woman who apparently found the greater part of her recreation in dancing stated that two light party dresses at not less than \$16.50 each would be needed each year. These, she said, would soon become soiled and would not stand dry cleaning more than once or twice. The great majority of women, however, expressed themselves as well satisfied with one dress for party or afternoon wear. This would cost

about \$25 and would wear two years at least. Some girls related with pleasure their ability in "fixing over" old party dresses so that they could be worn for three or four years. As mentioned before, however, the girl who had to economize closely usually dispensed with a party dress and substituted the wearing of a dress waist with a suit.

HATS, SHOES, GLOVES, STOCKINGS, UNDERWEAR, AND MISCELLANEOUS.

Hats.—The great majority of these women, who spent sufficient on clothing to be well dressed but not sufficient to be classed as extravagant, purchased two or three hats a year, usually at a total cost of from \$10 to \$15. The actual number of hats obtained, however, can not always be reconciled with the total expenditure for this purpose, as some women are able to, and do, make their own hats. Of the women included in this special study, 12 did all or a part of their own millinery work, one reporting four hats at a total cost for material of \$8.08, and another, four hats at a cost of \$6 for material.

Shoes.—Even in this selected group of women, the character of work performed makes a difference in the expenditure for shoes. Although the saleswoman would naturally need more shoes than the woman of sedentary occupation, three pairs of shoes a year was the usual number, with either two or four pairs not unusual. For high shoes, the women interviewed felt that about \$6 was the minimum price which should be paid for shoes, and many felt that this minimum price was entirely too low for economy. Under these circumstances, it is not surprising that the averages for shoes should run from \$12 to \$17 a year.

Gloves.—In the case of gloves, two or three pairs seemed to meet the normal requirement. These were usually purchased at a total yearly cost of from \$2.50 to \$5. Where \$2.50 or less was spent for two or three pairs of gloves, it is evident that only lisle, chamoisette, or silk gloves were used. The amounts ran higher when good kid gloves were bought.

Stockings.—Over half of the women in this special study bought between 5 and 10 pairs of stockings during the year, and slightly over one-fifth purchased between 10 and 15 pairs. The price per pair varied considerably. One of the women interviewed stated that she never paid more than 25 cents a pair for stockings and that she got along very nicely without any silk stockings. Another had found that three pairs of silk stockings at \$1 per pair, mended immediately when necessary, would wear for one year. Another stated that she wore silk stockings all the time and that they were absolutely essential to her feeling of being well dressed. Still another said that she felt entitled to a pair of silk stockings "now and then" when she found

them at reduced prices. Of the total of 53 women, about equal numbers got their hosiery for less than \$2.50, \$2.50 to \$5, \$5 to \$7.50, and \$7.50 and over, with the general average being between \$5 and \$6.

Corsets.—Of the 53 women in the groups selected, 21 had bought one pair of corsets during the year, and 21 had bought two pairs. The number buying more than two pairs was negligible. No such uniformity existed as to price. Two dollars to \$5 was the yearly amount spent by the majority, although a considerable number spent less than \$2 and a few spent more than \$5 per year.

Underwear.—Articles of underwear seem to have "hold over" qualities with some individuals, but among these women the general upkeep of underwear seemed to require a yearly expenditure of between \$5 and \$10. This amount covers nightgowns, white petticoats, corset covers, and all other lingerie, but \$10 per year is not sufficient where silk petticoats are considered necessary to the standard of living. Although silk petticoats were reported by some, a great many did not regard them as essential.

Miscellaneous.—The miscellaneous items—such as umbrellas, rubbers, handbags, handkerchiefs, neckwear, aprons, and kimonos—usually averaged about \$10. Where the amount spent on these items ran much higher than this it was due to the inclusion of furs and jewelry.

SUMMARY OF CLOTHING COSTS.

From the above analysis of clothing needs and expenditures the following summary may be drawn as to the approximate cost of clothing for a working woman who is well, but not extravagantly, dressed. The conclusions are based on the experience and opinions of the group of women referred to above.

As regards external clothing, it would appear that the average wage-earning woman who is well dressed usually chooses these items of her wardrobe from the following-priced articles: Suit or coat (alternate years), \$25 to \$30; shirt waists, \$6 to \$15; one-piece dress, \$15; wool skirt, \$5 to \$10; summer skirts, \$3 to \$5; party dress (worn for two years), \$25.

If close economy is necessary, a skirt at about \$5 may be worn with separate waists in lieu of a \$15 one-piece dress; or a dress waist, worn with a suit, may be substituted for an evening dress; or a winter coat may be worn for three seasons, or an evening dress for three or four years. In view of the range of choice, it appears that a woman may reasonably be expected to secure the outside clothing necessary for a good appearance at an expenditure of from \$70 to \$75.

As regards articles of dress other than outside clothing, the necessary expenditures would be distributed roughly as follows: Hats,

\$10 to \$15; shoes, \$12 to \$17; gloves, \$2.50 to \$5; stockings, \$3 to \$7; corsets, \$2 to \$5; underwear, \$5 to \$10; and miscellaneous, approximately \$10. Allowing for individual variation in prices and choice, this means an annual expenditure of from \$50 to \$60 for these articles, which as a rule have to be replaced each year.

Combining these two amounts—outside clothing \$70 to \$75 and other articles of dress \$50 to \$60—the total yearly expenditures would range from \$120 to \$135, averaging approximately, say, \$125.

In arriving at this sum, the assumption has been, of course, that the working woman purchases most of her wardrobe and need not devote her evenings and Sundays to the making of her own clothes. It is to be expected that such a woman will spend considerable time repairing, and to some extent, making over her clothes, but it does not seem reasonable to demand that a woman, with a full day's work to do, should spend her off-time working overtime at what would really be a second "job."

Nor in making the above computations has any allowance been made for discounts allowed by some stores on purchases made by employees. Such a system applies only to store employees and, at best, is not sufficiently general among the stores of Washington to make much difference in the clothing expenditures of working women as a class.

LAUNDRY.

Very closely related with the cost of clothing is the expenditure for laundry. Among the total of 600 wage-earning women covered by the Washington study, various laundry arrangements were found. Many of the women living at home received laundry free, others paid for it in connection with their board and lodging, and not a small number did all or a part of it themselves. Of those who had a definite expenditure for laundry, an average of 50 cents a week was about the minimum. Women whose work demanded a freshly laundered waist every day found a considerably larger expenditure necessary. From previous investigations on this subject it seems to be agreed that no wage-earning woman should be compelled by economic necessity to spend her evenings in laundry work, and if this condition is not to exist, her earnings must be sufficient to leave from \$30 to \$35 available for her yearly laundry expense.

COMPARISON OF STANDARD COSTS WITH AMOUNTS ACTUALLY SPENT.

The amount just derived—\$125—as the approximate yearly expenditure necessary for maintaining a working woman in a "well dressed" condition in the city of Washington is somewhat higher than the minimum standards arrived at by other investigations in other cities. Part of this difference is due to the increased cost of

clothing since those investigations, part to the higher clothing standards arbitrarily set by conditions in Washington city, and part to the fact that most of the other investigations have been illiberal in their estimates of the clothing needs of a woman and optimistic in their estimates of clothing costs.

Thus, the New York State Factory Investigating Commission, in 1915, in submitting its conclusions regarding the clothing costs of working women, states that "the matter may be summed up by saying that a girl may respectably clothe herself on between \$85 and \$90, and that she can maintain a fairly good appearance with about \$100."¹ The specimen list of clothing submitted by the commission is as follows:

Union suits, 3 at 50 cents ; 3 at 75 cents	\$3. 75
Corsets, 2 at \$1.50	3. 00
Corset covers, 6 at 25 cents	1. 50
Underskirts	1. 50
Stockings	3. 00
Wash dresses, 2	7. 00
Party dress	15. 00
Skirts, 1 at \$2.50, 1 at \$5	7. 50
Shirt waists, 6 at 75 cents	4. 50
Shoes, 2 pairs at at \$3.50, plus \$2 for repairs	9. 00
Heavy waist	2. 00
Hats, 1 at \$5, 2 at \$2.50	10. 00
Coat, winter, one-half of \$12	6. 00
Coat, spring or rain, one-half of \$8	4. 00
Gloves	1. 50
Rubbers, 2 pairs at 65 cents	1. 30
Umbrella	1. 00
Night dresses, 2 at 50 cents	1. 00
Handkerchiefs	. 60
Miscellaneous	4. 85
	88. 00
Highly desirable additions:	
Suit, one-half of \$15	7. 50
Slippers, one-half of \$1	. 50
Gloves, white, for parties	1. 00
	97. 00

Aside from the question of the sufficiency of the items listed, a checking up of the prices allowed in this table showed that, in most cases, it was impossible in Washington either in 1916 or 1917 to obtain the articles specified at the prices given.

The New York commission's standard of \$88 per year may thus be taken as providing only the barest minimum for "decent" clothing.

¹ Fourth report of the New York State Factory Investigating Commission, 1915, vol. 4, appendix 7, pp. 1529-1531.

Thus, it is of striking significance to note that, even with this low minimum as a standard, 42 per cent of the 600 wage-earning women included in the Washington investigation had a yearly expenditure of less than that amount, and in many cases the expenditure was very much less. If the \$100 standard, proposed by the New York commission as permitting "a fairly good appearance," and supported by the Wisconsin commission in 1916,¹ is taken as a minimum, then no less than 52 per cent of the 600 wage-earning women in Washington fell below that amount.

Finally, if the sum of \$125, arrived at in the present study, is taken as the approximate yearly amount necessary for good dressing, then 68 per cent of the Washington wage-earning women are found to have spent less than that amount in 1916.

A detailed analysis of this subject is given in the following table, which shows, by income groups, the number and per cent of women whose yearly expenditures for clothing fell within each classified amount.

EXPENDITURES OF 600 WASHINGTON WAGE-EARNING WOMEN FOR CLOTHING IN THE YEAR 1916.

Annual income.	Number of women.	Number spending on clothing per year—

¹ Wisconsin Industrial Commission. Cost of living of wage-earning women in Wisconsin, 1916.

This table does not seem to bear out the generally current opinion that the wage-earning women of Washington as a class are inclined to gross extravagance in the matter of clothing. Of the total of 600 women 82 per cent spent less than \$150 per year for this purpose; 93.5 per cent less than \$200; and only 6.5 spent as much as \$200. In some cases the larger annual expenditures represented a year of unusually heavy expense, due to some exceptional combination of circumstances, while in a very few extreme cases the large expenditure was plainly the result of unwise selection of clothes or of inexcusable extravagance. These latter cases occurred principally among women who were assisted by their families. Indeed, with the incomes shown in the preceding table, no flagrant extravagance in dress can very well exist.

RISK AND AVOIDANCE OF TNT POISONING.

BY ARCHIE RICE.¹

Between 7,000 and 17,000 cases of TNT poisoning, resulting in between 135 and 475 fatalities, will probably occur among workers in American shell-loading plants during the production of the 78,000,000 rounds of cannon ammunition already ordered by the United States Government for use in the European war. These estimates, based on two standards of experience in munition plants in the United States, may be expected to hold, unless radical improvements be made in health-conservation practices.

About 5 per cent, or from 350 to 850, of the cases of poisoning will happen to workers within the first two days of their exposure; 75 per cent, or from 5,250 to 12,750, of the cases will become manifest after four to eight weeks of employment; and 20 per cent, or from 1,400 to 3,400, of the cases will develop after three months, five months, even seventeen months or more, of apparent immunity in TNT department work.

The fatalities may be expected to result within a few weeks, or may not take place until a number of months after the victim has been attacked.

These are not alarmist statements. They are deductions based on actual records compiled not during a hurried official investigation that was perhaps anticipated, but during 20 months of daily observation at a plant that did approximately one-tenth of all the TNT shell-loading work performed in the United States for various foreign governments allied against Germany.

At first glance these figures might appear unwarrantably large. But it should be understood that in the munition district there is a very great shifting of labor. The labor turnover at most munition plants is so great that it is not unusual to have from 2 to 30 different persons for each job during one year's operations.

There are interesting local problems often largely responsible for this remarkable unsteadiness of the labor supply. This article, how-

¹ Mr. Rice has been for two years connected with an American munition plant using hundreds of tons of TNT, has been among and interviewed scores of TNT workers, has himself been mildly poisoned with TNT, and has had access to voluminous confidential British reports on TNT poisoning in English munition factories. In October of 1916 he presented before the annual convention of the American Public Health Association a paper on "Munition-plant Poisons."

ever, concerns only the TNT risk. That risk might with reasonable and very inexpensive precautions and with proper medical supervision be reduced 80 to 90 per cent or even more, resulting in the preservation of life and in the safeguarding of human efficiency for labor's needs.

The sessions of the American Public Health Association's annual convention, held in Washington in October of 1917, were concluded with a six-hour discussion participated in by health officials, Federal officials, and munition makers. At that time it was intimated by representatives of the largest manufactories of TNT that there is comparatively little TNT poisoning, and that the slopping of molten TNT upon the outside of projectiles during the loading process is an unavoidable feature requiring handwork in the removal of the poisonous explosive substance.

A supplementary conference of health officials and munition makers was held in New York City during two days in December. Its purpose was finally to consider and perfect for the Council of National Defense a health and hygienic code for the munition industries. The longest and most vigorous discussion concerned TNT poisoning.

Federal officials and health officers generally voted in favor of a clause proposed as a humanitarian protection to workers known to have had an attack of TNT poisoning. The munition makers as a group voted it down. Efforts were later made for a compromise that would provide the worker with a definite memorandum that might aid him in illness later arising and after his leaving the company's employ. That effort also failed.

Opposition seemed to be of two kinds. It was argued that munition workers should not be told the real danger as it would make them unduly apprehensive. The other objection was that workers should not be given any memoranda to be used for self-protection of health or as a valuable guide to physicians possibly called upon later to treat them at places far from the plant, because such memoranda might sometime be used by adventuring lawyers as bases for troublesome suits for damages.

Contention was made for the employers that the proper procedure should be to educate all the doctors of the country in the diagnosis and cure of TNT poisoning. That might be accomplished after several years, but in the meantime TNT victims would multiply, and needlessly.

In the prediction of between 7,000 and 17,000 cases of TNT poisoning and between 135 and 475 TNT fatalities there is a wide range. This difference is due to the application of two standards. The smaller numbers, 7,000 cases and 135 deaths, are based on the general

record throughout 20 months of productive operations at the plant studied. The larger numbers, 17,000 cases and 475 deaths, are based on the record of that plant during its first seven and a half months of operations. Even during that earlier period the plant used many protective devices, some of which have not yet been introduced in other plants.

TNT poisoning is comparatively a new problem, and information on the subject is lacking or inadequate. How insidious TNT poisoning really is was not suspected until an alarming number of cases developed among munition workers in England. There tens of thousands of women are employed in the munition plants, all of which are directly under Government control, with stricter supervision of workers than has thus far been possible in the United States.

Even assuming that other American plants, during the making of munitions for the Allies, attained the degree of protection against TNT exposure that was achieved by the plant studied, then during the period of such loading there were in the United States probably 1,800 cases of TNT poisoning altogether and 43 fatalities, a majority of them perhaps not recognized as TNT poisoning and occurring at considerable distances from the plant where the workers were poisoned and perhaps weeks after they had left its employ.

That this general subject may be readily understood by persons not familiar with the manufacture of explosives or with the assembling of munitions or with medical phraseology all technical words and details are purposely avoided. For brevity various highly explosive compounds composed in whole or in part of trinitrotoluol will all be designated by the commonly used three-letter symbol TNT.

High-explosive shells are steel projectiles having a cavity which is loaded with a powerful but relatively shock-proof chemical substance that explodes by percussion of an interior metal fuse when the shell strikes. The detonation of the bursting charge must not occur in the gun or near the gun but at the instant of contact with the distant objective. The projectile, after a long curving flight, strikes anywhere from 1 to 28 miles from the cannon that hurled it. The detonation of the interior high explosive rends the shell asunder in hundreds of destructive fragments, thereby widely distributing the damage. For this reason a safe and effective bursting charge is of great importance.

Ordinary powdered sulphur, which in itself is harmless, becomes sulphuric acid when chemically treated. Ordinary harmless white chunks of niter (sometimes called saltpeter or nitrates), yielded by the inexhaustable shallow mines of Chile's highland plateaus, become nitric acid when chemically treated with sulphuric acid. Ordinary harmless sweet glycerin, which is a four-times-refined by-product

from the foul-smelling refuse grease of a soap factory, becomes, when chemically treated with nitric acid, the frightfully destructive nitroglycerin, which is an innocent-looking, oily fluid resembling white-sugar sirup such as is used for hot cakes. When nitroglycerin is soaked up in fine sawdust and placed in paraffin-treated paper tubes it is known as dynamite, and each tube as a stick of dynamite.

Nitric acid chemically combined with toluene, which is a coal-tar by-product of gas works and of dye works, becomes tri-ni-tro-tol-u-ol, hence its abbreviation TNT. But pure trinitrotoluol is not the only bursting charge loaded into steel projectiles and now known as TNT.

USE OF AMATOL IN ENGLAND.

In England 70,000,000 shells are reported to have been loaded with amatol. This is a chemical compound of nitric acid and ammonia, with a one-fifth admixture of trinitrotoluol. Ammonal, alumatol, and some other mixtures, each containing not less than one-tenth trinitrotoluol, are also used. Bearing in mind that in England all these substances of minor trinitrotoluol content are called TNT, it becomes evident that while England loaded 70,000,000 shells with amatol, the workers were handling only about as much real TNT as would be required in America for 14,000,000 shells. Among approximately 100,000 workers in all manner of munition plants in England there were discovered up to the end of the year 1916 a total of 53 TNT fatalities. The use of trinitrotoluol alone might have made the death toll several times as great. England also had 181 TNT jaundice cases. If TNT alone had been used there would have been five times as much handled and possibly a corresponding increase in TNT jaundice cases.

The record of TNT poisoning in England does not sufficiently convey an idea of the general danger of TNT for those who handle it. Amatol, as used in shell-loading plants in England, is a moist, dustless mixture of somewhat the consistency and appearance of vanilla ice cream or lemon water ice. In that form it issues from a machine and is mechanically squeezed into the shell, about as dental cream is squeezed out upon a toothbrush, and without the early incidental scattering of dust such as occurs with pure TNT. Each bursting charge of amatol, which in itself is one-fifth pure TNT mixed with four-fifths ammonium nitrate, is finally sealed over in the shell and the detonating-fuse cavity lined with molten TNT in amount not one-tenth as great as the shell would receive if loaded with pure TNT. Where less TNT alone is used and the process produces less dust there must be less contamination of the breathing atmosphere, and for this reason there is probably less TNT poisoning risk in England than in America for a like number of shells loaded.

Pure TNT is a canary yellow, powdery substance, consisting of tiny crystals almost as fine as dust. It melts at 80° centigrade (176° F.) and becomes a reddish-brown fluid resembling maple sirup. It can be dissolved in ether, in acetone, and in some other substances. It is bitter to the taste, and its presence in the atmosphere, even in scarcely detectable dust or perhaps only as invisible fume, may readily be noted by a bitter taste if the mouth be occasionally opened as in talking. This quick effect through the mouth and probably upon saliva that may later be swallowed indicates perhaps the manner in which is caused much of the TNT catarrh of the linings of the stomach and intestines. Severe frontal headache and sometimes vomiting follow soon after some comparatively short exposures to TNT atmospheres.

There were 169 cases of TNT poisoning at the plant studied. These cases consisted of 137 workers who had but the one attack, 12 who had two attacks, and 2 who had four attacks. There were three fatalities, and two of them resulted after a second attack, indicating that there was individual susceptibility and that these workers should not have been subjected again to TNT risk without careful medical supervision.

In England, where the summers are much cooler and there is relatively less escape of TNT to menace the worker, it is claimed that the number of initial cases of TNT poisoning has been materially reduced, and therefore the productive efficiency of the plant force improved, by serving free to the workers milk or hot cocoa. Possibly somewhat similar results might be achieved, and more cheaply and practically, when milk is difficult of purchase near isolated munition plants, by having all workers rinse out their mouths several times a day with warm water to remove all saliva impregnated with TNT. In England, moreover, no TNT worker is now employed longer than two weeks without being shifted for a like period to some department not exposed to the poison. The most precise clothing regulations are enforced, and neither food nor tobacco can be brought beyond the house where absolutely all clothing is removed and changed both before and after work. After a few experiments in that country it was claimed that the entry of TNT poison was not so much by inhalation of the dust and fume or by the swallowing of dust, as by actual absorption through every part of the skin or of the mucous membrane exposed to TNT dust or fume or vapor. Some deny that surface absorption of TNT is the principal means by which the poison enters the system.

TNT is not an immediate poison. It is not a direct cause of death. Its grave danger lies in the fact that it so impairs certain organs that death ensues because of the destruction of some necessary function

of the body. This article makes no claim to presenting any medical solution for the problem of TNT poisoning, but it does claim to present some new facts as to TNT risks and in a novel manner.

Imagine a loading plant with a daily possible output of 10,000 to 15,000 rounds of ammunition of three-inch caliber. A three-inch shell is but one-twentieth of an inch larger in diameter than the famous French 75-millimeter shell that is to be most extensively made by the United States. Such a plant would employ perhaps 1,000 persons, but only 300 of them would be required in actual TNT departments, 300 in production departments where workers are only occasionally exposed to TNT, and the balance of 400 workers would not be at all exposed to TNT hazards.

WASTE OF TNT.

Applying the general experience at the plant studied, such a works would lose in waste at least 400 to 600 pounds of TNT a day, and more likely from 960 to 1,440 pounds in vapor, in fume, in dust, in dirtied scrap particles, and in unrecovered spattered bits. This loss would occur mostly in proximity to the 300 TNT workers. In bulk that much powdered TNT would be about three to twelve barrellfuls.

With the 78,000,000 shells contracted for up to Christmas of 1917 the probable total loss of TNT in the loading processes incident to the making of the new Government ammunition would be at least 3,120,000 pounds, with the conserving methods used at the plant studied, and probably 7,488,000 pounds, with the percentage of waste existing at most of the other loading plants in America.

The difference between these extremes in probable TNT waste on loading contracts for the Government is 4,368,000 pounds of TNT. And TNT was formerly sold at approximately \$1 a pound. Under such conditions it would appear that for those manufacturing TNT for the loading plants the greater the waste of TNT assumed as permissible or unavoidable the greater the amount of TNT that would have to be purchased by the Government, which means the American people.

As most United States war contracts are based on actual cost of materials, plus 10 per cent allowed the contractor as profit, there is no great incentive to exercise the most exacting economy.

If the Government would take adequate precautions to lessen the amount of TNT permitted to escape and be wasted it would at the same time be lessening the TNT risk for the workers. Also there would be a saving of about \$4,000,000 in TNT values. The expenditure of a very small percentage of such a saving would give ade-

quate plant and Government provision for a reduction of the TNT risk to the lowest possible percentage.

In a changing force of about 500 men at the plant studied there were during 20 months, in addition to the 169 cases of TNT poisoning and 7 or more not recorded because of insufficient data, 55 production accidents, and 80 accidents that occurred in construction, repair, and outside work or duties.

That means that 56 per cent of all the medical cases at the shell-loading plant were due absolutely to TNT poisoning, that 18 per cent were due to accidental injuries incident to production work, and that 26 per cent were connected with ordinary construction and repair work and the usual slips, knocks, and hurts where much rough manual labor is performed. Perhaps the most serious of the accidental injuries was a broken leg. One man had an arm broken in cranking a car. TNT poisoning caused three known fatalities.

The point is that medical protection for TNT workers is a much more important feature than was even suspected, and should include preventive measures suggested by a carefully observing resident physician. In all other cases at the plant medical protection implies only curative treatment after the accident has happened.

FOUR KINDS OF TNT POISONING.

TNT poisoning manifests itself in four different ways.

In its simplest form it is merely a local irritation of the exposed skin of the hands, face, or arms, with tiny watery eruptions somewhat like those caused by poison ivy. This eczema usually responds readily to simple medical treatment on the surface and does not interfere with the worker's employment, although occasionally causing some itching. The skin cases at the plant studied were only about 5 per cent of the whole number of TNT afflictions, and there appeared to be but one skin case with long-persisting effects.

The commonest form of TNT poisoning is that affecting the stomach. The stomach and intestinal effects are probably caused by TNT, in fume¹ or dust, or both, and perhaps in vapor, entering through the mouth and the nasal passages and also repeatedly swallowed in impregnated saliva or with foods touched by hands soiled with TNT. The result is that the membranous linings of the stomach and the intestines become affected with a catarrhal condition, probably due to the irritant effect of the poison. There are griping pains as in other cases of gastritis. Many of these TNT cases are accompanied by some constipation. It may be argued that the poisoning induces constipa-

¹ By fume, as here used, is meant that rather intangible essence that is not a vaporous emanation or an obvious dust. One readily detects by the fume the proximity of a glue factory, a tannery, a cesspool, even in a dry atmosphere.

tion, or that failure to keep the bowels free increases susceptibility to TNT by stopping natural channels for eliminating poisons from the system. In a milder form this stomach condition is expressed in violent frontal headache, nausea, and the usual quinine-like, bitter taste in the mouth, and is sometimes caused by a comparatively slight exposure to TNT. Such an attack lasts only 24 hours or so. Records at the plant studied showed that about 60 per cent of all the TNT cases were classified as TNT affecting the stomach. With this condition there may have been other symptoms not recorded or determined.

Another form of TNT poisoning is anemia, manifested by a progressing loss of color. This develops gradually, and reaches no obvious climax as in the skin eruptions or the griping stomach pains, both of which conditions are quite evident to the affected worker. TNT anemia is different from the deadly, pernicious anemia. The latter is the result of a lessening of the red corpuscles in the blood, but TNT anemia is said, in England, to show on post-mortem examination a lessening in the red coloring matter in the marrow within the bones. It is thought to be one of the most dangerous and insidious forms of TNT poisoning, but tendencies toward its development ought to be easily detected by the physician while making daily strolls through the TNT departments.

Perhaps the form of TNT poisoning most often having fatal results, unless it be detected in time and properly diagnosed and prescribed for, is TNT jaundice. At its worst, this develops into the always fatal acute yellow atrophy of the liver. This is a condition characterized by profound destruction of the liver cells.

Two of the TNT deaths among the workers at the plant studied were diagnosed independently by different physicians as acute yellow atrophy of the liver, and a third TNT fatality is believed to have been a TNT jaundice development rather than a TNT anemia case. Both anemia and jaundice caused by TNT are probably due to cumulative absorption of TNT fume, dust, or vapor.

Susceptibility to TNT poisoning and immunity from it vary as widely as do the dispositions and personal and hygienic habits of the individual workers. But there are persons with certain medically discoverable weaknesses and tendencies who should never be employed in TNT departments. Among those who should for their own safety be most emphatically forbidden to work in TNT atmospheres are persons using alcoholic beverages and persons who have been addicted to their use. This is so because alcohol has already affected stomach linings or the liver or is weakening these points of greatest vulnerability to TNT attacks. Persons habitually breathing through the mouth should also be excluded from TNT work.

TYPICAL CASES OF POISONING.

The following are some typical cases of poisoning of TNT workers:

A. A., an American, age 21, after five months' continuous employment and immunity in the melting department, had a gastritis attack from TNT poisoning and was ill one week, being prescribed for by the consulting physician. He then resumed the same work, apparently all right. Two and a half months after his first case he had a second attack, one and a half months later he had a third attack, and two months later a fourth attack. After 20 months in the melting department, latterly as foreman, he quit to become a Government inspector in another plant. Apparently he had suffered no permanent ill effects. He was a tall, healthy young man of exemplary habits and never drank.

L. A. T., a Frenchman, age 21, after several weeks' employment in the boring department, had an attack of TNT gastritis and TNT skin poisoning. He was away from work one week under the doctor's care. On his return to the plant he was assigned to a department handling only smokeless powder and brass cases in a building apart from TNT atmospheres. Because the pay there was less than he had been getting he shifted, after a few days, back to his old job. There, in the boring room, 17 days after his initial attack, he developed such a condition of face poisoning and swelling that he quietly quit work and disappeared. Three weeks afterward he died at his home in Canada, 400 miles from the plant. He drank.

W. S. T., an American, age 31, after several weeks' work in the boring department, developed a very severe case of TNT poisoning, with symptoms at first worse than those shown by two others who died. He went to his home in a town about 10 miles from the plant and was there visited by the company's doctor, whose instructions he and his attending wife followed carefully. Practical nursing and dietary during three weeks helped to restore him to an apparently normal condition. He then returned to the plant and was assigned to the carpentry force, with which he continued to work in good health for many months.

S. N., a Pole, age 20, after several weeks' employment in the melting department, quit work and disappeared. A fortnight or so later the company doctor heard a rumor that this man was very ill at his home in a small town 8 miles from the plant and that his relatives attributed his illness to a TNT attack which had made him decide to quit work. He was being treated by the village doctor. Two months after the original effects of the TNT poisoning this worker died of acute yellow atrophy of the liver, having had the later progressive symptoms peculiar to TNT poisoning. He had been and was addicted to beer drinking.

J. A. W., an American, age 55, had been employed many weeks in the boring department when he developed a case of TNT gastritis and other symptoms of TNT poisoning in a bad form. He lived on his farm about 15 miles from the plant. He remained there ill 20 days and under medical treatment, then returned to the plant and was assigned to carpentry work, which was mostly in the open air. Somehow he was briefly exposed to TNT again and got another attack. He then quit the plant altogether and went back to live on his farm, showing pronounced evidences of TNT jaundice, which became worse, his eyes being almost completely yellow and his face swollen. He was in the same condition, apparently doomed, but still able to be up and about 17 months after his initial attack. He had been and was a very heavy drinker. This second attack was not reported to the plant doctor.

H. F., an American, age 27, after seven months' employment at shellacking the bored-out cavity in the TNT charge in the shells had TNT gastritis, and five months later had a second attack while at the same work. Following these attacks he experienced unusual physical weakness and tired so easily that he had to sit down to rest several times during a mile walk to or from the cars. His personal theory was that by continuing while at work to chew tobacco, which he disliked, he rid his mouth of TNT-impregnated saliva. Eight months after his second attack and while at the same daily task he reported that his undershirts still showed each week deep TNT perspiration stains under the arms and that his wife had to bleach out these large reddish-brown blotches by soaping them and laying them in the sun before she ventured to hang the garments on the line where they might be seen by the neighbors.

W. P. W., an American, age 23, after three months' service in the cooling department quit work when the week ended and two days later called on the company doctor for TNT treatment, explaining that he had an attack two days previously. The doctor told him to come the following day for further treatment. The patient never returned. Not until nine days later did the doctor locate him, in a private boarding house in a city 9 miles from the plant and 14 miles from the doctor's office. The patient was ill abed. His landlady, who was attending him, was admonished not to let him get up or go out. When the doctor visited the place next day the patient was gone. The landlady reported that she had been unable to deter him from leaving, that some friends had come, and that they had all gone off together for a day's celebration at a fair in a city 20 miles away. On his return the next day the patient was removed to a hospital. There he continued to grow worse. Four weeks after his initial indisposition he died of acute yellow atrophy of the liver,

suffering toward the end considerable pain and the usual state of coma preceding death. He was addicted to beer drinking and the use of other alcoholic beverages.

C. D., an Englishman, age 28, after three months' work in the melting department had an attack of TNT poisoning and was transferred to a department where he was unexposed to TNT. There he continued to work, but 11 months after his case of TNT poisoning he still found himself unable to retain urine beyond a few moments following the first urge, and could never sit long in a movie show or elsewhere without having to get up and hurry out. This might have been due to some other bladder condition, but his kidneys were not very strong when he began the TNT work.

CASES OF APPARENT IMMUNITY.

J. W., an American, age about 40, was employed in the TNT departments during a period altogether of 20 months—as foreman and as night superintendent and then as head of the melting and pouring department. Daily he touched TNT with his bare hands. Often he ate sandwiches while his hands were unwashed of TNT and his mouth unrinsed of TNT. Later he came in proximity to TNT fume and more TNT vapor than before. The obvious immunity of this veteran powder man, who had worked for years in a dynamite plant, was often cited as an example of how almost anybody could avoid TNT poisoning by leaving liquor alone and taking good care as to health and hygienic habits. Then, after 17 months of immunity, this man got his first case of TNT poisoning, a gastritis attack. He prescribed for himself, and he neither quit work nor reported to the doctor. He swallowed two fresh raw eggs and took a laxative every day during the continuation of the perceptible effects of the TNT. Two weeks later he was similarly poisoned the second time. Two weeks after that he was poisoned the third time, and in another two weeks he was poisoned the fourth time. Each case he treated in his own way and continued with his work. He was a total abstainer, but earlier in life had indulged in alcoholic beverages.

J. J., an American employed as a driller in the boring room, worked in TNT atmospheres altogether a total of 872 hours, including one day of 12 hours' service and six days of 10 hours' application to the work. A few weeks after the period of the long working days he experienced an attack of TNT gastritis in the cold weather two days before Christmas. He was cared for at home, and did not report to the plant doctor. Except for the seven long workdays mentioned, all his service, and especially all of that following the time of his attack, was on a basis of six days a week and eight hours a day.

R. G., an American, age about 40, worked 48 consecutive weeks as a driller in the boring department, exposed to its fine dust and to its fume conditions, during a total of 2,622 working hours, without experiencing any ill effects from TNT. At first, when conditions were not good, he worked seven days a week three different weeks, putting in 74, 71, and 70 working hours those weeks. Afterwards, when conditions were improved and work was on a six-day and eight-hour basis, he put in 51 consecutive weeks, and was not affected by TNT. In that time there were two or three days of the hot and humid season when the thermometer just outside the rather closely walled and cement-bulkheaded boring room indicated 100 degrees in the shade.

M. P., an Italian, age 40, was continuously employed 20 months in the TNT melting and pouring department, but had frequent daily periods in the fresh air while passing to and from the TNT magazine. He was daily exposed to TNT dust while opening fresh boxes of the fine powder and to contact with TNT while placing in boxes scraps of TNT castings. He was also exposed to TNT vapor while personally cleaning out the big iron kettles in which the TNT is melted. Yet he was never affected by TNT in any apparent or self-discoverable manner. The only sign of his TNT employment was the regularly yellow-stained palms of his hands. Asked what he did to avert ill effects and keep himself in such evident prime physical condition, he replied: "Never drink; oh, my God, no! Never eat the sandwich with TNT on the hands. Never eat before wash the face and the hands. Wear the gloves, sure. When clean the kettles tie the handkerchief across the mouth, the nose. Eat plenty good grub. Sleep good."

At the plant studied about 95 per cent of the various and changing workers dwelt in more than 12 different towns, scattered from 2 to 12 miles from the place of their employment.

MEDICAL SUPERVISION.

At the end of 20 months of productive operations only about 7 per cent of the workers who had had TNT attacks remained in the company's employ. During those 20 months this plant had four different doctors. In the first nine months 108 TNT cases were observed and treated by a doctor whose office was in a town 5 miles from the plant and in a direction opposite to the general trend of workers' dwelling places. Three of those cases terminated fatally, and another will probably end the same way. At least seven other cases did not receive medical attention.

With the readjustment of the plant to further improve conditions, based on experience gained, patients were no longer conveyed by a

plant motor to this doctor at a distance. A young resident physician was secured for the plant, who observed and treated 43 TNT cases during his seven months' service. Two cases escaped medical notice. Another young doctor succeeded the first plant doctor and resided at the plant three months. During that time he observed eight cases of TNT poisoning. Several others did not report to the doctor. A third young plant doctor then succeeded to the work. He was resident during only the last month of this study, and he observed and treated but one case of TNT poisoning. Four or more other TNT cases occurred without reporting or seeking medical attention.

At no time was there preexamination of the physical condition of the workers, especially of those assigned to TNT departments. There was no touring by the doctor of TNT departments for a daily or weekly or any other casual observation of the appearance of individual workers. Much of the time about 70 per cent of the workers in the drilling department had bluish lips.

These conditions, it should be noted, existed at a plant where unusual efforts were made to conserve the efficiency of the workers, to protect them from dust and fume, to give them workrooms adequately warmed in the frigid season, and abundantly ventilated and well screened against mosquitoes and flies in the hot and humid season, and finally to pay them well and not to work them longer than eight hours a day. It is obvious that the risks must be greater at other plants similarly employing large numbers of shifting and little-known workers to load TNT into projectiles, but not observing similar precautions.

Very naturally it may be asked: If such conditions with respect to TNT exist in the munition industry of the United States why have they been permitted to continue? The answer is that the munition makers themselves have not yet appreciated the danger of TNT poisoning. TNT is comparatively a new commodity for extensive production in America, and the possibilities of its insidious influence upon certain peculiarly susceptible workers have not been studied or classified as an industrial problem.

As an illustration of how little is definitely known on some of these war subjects it may be mentioned that a month before Christmas of 1917 it was not generally known, even among ordnance officers, in the United States that a high explosive called amatol had already been used for three years in England and that 70,000,000 projectiles had there been loaded with amatol as the bursting charge. When a group of practical ordnance officers visited the plant studied and there witnessed the first shell loading with amatol ever attempted in the United States, the whole process was viewed with interest and surprise, and when those demonstration loads were given their

firing test at a Government range and produced a very high percentage of satisfactory bursts there was yet more enlightenment upon a subject that is three years old in England. TNT poisoning is being carefully studied in England and its risks lessened.

What effect work weariness may have in increasing susceptibility to TNT was not determined at the plant studied. But during the 20 months the record of incidence of TNT poisoning cases showed that 24 cases occurred Mondays, 15 occurred Tuesdays, 24 occurred Wednesdays, 16 occurred Thursdays, 32 occurred Fridays, 52 occurred Saturdays, and 6 occurred Sundays.

That Saturday showed 66 per cent more cases than any other day and that Friday was the next highest risk day seem more than a coincidence. It may indicate accumulating poison in the system or work weariness after four or five days of continuous exposure. A partial explanation may lie in the fact that at this plant the workers were paid off every other Friday, and that the chief and most easily available amusements were those offered by the numerous saloons sprinkled closely about the munition plants or in all of the towns where munition workers dwell. In England experiments made with TNT purposely taken into the human system in larger than a daily work-exposure possibility showed TNT in the urine within about two hours after taking. The presence of TNT continued to be manifest up to about 24 hours after taking, but after that only decreasing traces of TNT were detectable. This might indicate that when the human system is given a weekly respite of 24 hours from TNT exposure the body then has a chance to readjust itself in preparation for another period of exposure. The comparatively few Sunday cases here recorded were due to the infrequency of Sunday work.

Records seemed to indicate that the hot or perhaps the humid weather greatly increased the risk of TNT poisoning. It may be that because TNT has a great tendency to absorb moisture the atmosphere in hot and humid weather is more than usually impregnated with TNT as vapor.

Nothing of value was deducible from the insufficient data available as to comparative racial susceptibility among the TNT workers. A majority of the TNT workers were Americans, but no percentages as to race were compiled. After varied experience native Americans were preferably employed for TNT work. Of the 151 individuals making up the 169 TNT poisoning cases 105 were Americans, the next highest numbers being 18 Poles, 16 Italians, and 8 Russians. No women and no Negroes were employed, and only a few men of 18 and 19 years of age, and but two or three of them in the TNT departments.

COMPARATIVE WORKING RISKS.

One very helpful conclusion was reached as to TNT risk. The relative percentage of risk was determined for the several departments. So far as their possible exposure to TNT poisoning is concerned, the employees at a shell-loading plant may be divided into three classes. The first and almost unexposed class consists of the office force, the machinists, electricians, tinsmiths, carpenters, firemen, guards, yardmen, and chauffeurs—altogether comprising about 40 per cent of the plant force. They have nothing to do with production-department work and rarely have occasion to incur personal risks of TNT poisoning.

The second and only occasionally exposed class consists of all those workers engaged in plant-production tasks but not employed in any of the TNT departments. This group forms about 30 per cent of the plant force, comes occasionally in contact with some TNT fume or dust, and furnishes less than one-tenth of all the TNT poisoning cases.

The third and regularly exposed class includes all those workers in the TNT departments, a group generally about 30 per cent of the plant force. This class of workers comes constantly in contact with TNT or its dust or fume and furnishes more than nine-tenths of all the cases of TNT poisoning.

This narrowing of the TNT problem is a partial reply to the sweeping objections of some munition makers to proposed medical examinations and frequent inspections. The chief contention by such objectors is that it would be handicapping, delaying, and expensive to have to examine all the tens of thousands of workers in the munition plants.

Workers in the TNT departments of a shell-loading plant may be divided into four groups, according to the nature and sequence of their tasks.

In the first TNT group are those engaged in melting the powdered TNT and then stirring it and pouring it into the steel projectiles. This is a process that necessarily liberates considerable TNT vapor and much TNT fume, and also there is a relatively small escape of TNT dust into the atmosphere, incidental to the opening and emptying of the original boxes. About 40 per cent of all the TNT workers are needed in this melting and pouring department. In the plant studied the melting department, when operating under its improved conditions, showed that in a year's operations every 100 jobs yielded 64 TNT poisoning cases. To make this risk rate clearer: Here, let us say, is a department regularly requiring 100 workers a day. The personnel of the working force may and it does change, but there are only 100 jobs, even if 1,000 different persons be employed

to keep those jobs filled. The number of TNT poisoning cases produced by the 100 jobs in a year is the risk rate in that department. Some workers may have remained only one day, others may have worked weeks or months; still others may have continued throughout the year. But no matter what the varying individual experience or susceptibility, the number of TNT poisoning cases produced by those 100 jobs is here called the risk rate. If the 100 jobs could have had a new set of 100 workers each day the risk rate would have appeared very small. If the 100 jobs could have had the same 100 men throughout the year there would have been more TNT cases, and the risk rate would have appeared much larger.

In the second TNT group are those engaged in cooling the bursting-charge of TNT that has been poured into the shell, removing the petticoated funnel from the shell orifice, stripping the protective paper wrapping from the outside of the shell, and shearing or cutting off with bronze saws the excess chunk of protruding TNT above the filled shell cavity. In this process there is a little vapor, much TNT fume, and more TNT dust and contact than occur in the melting and pouring department. The cooling department requires about 10 per cent of all the TNT workers. In the plant studied, the cooling department, under improved conditions, showed a yearly risk rate of 33 TNT poisoning cases for every 100 jobs.

In the third TNT group are those employed at or about machine-run drills used in boring within the TNT charge in each shell a central cavity for the reception eventually of the detonating fuse. This boring process creates quantities of very fine TNT dust, produces some TNT fume, but is not accompanied by any TNT vapor, except such as may be in the air because of very fine dust converted in humid weather. The boring department requires the services of about 20 per cent of all the TNT process workers. In the plant studied, the boring department, after adopting improved methods, developed a yearly risk rate of 33 TNT poisoning cases for every 100 jobs, the same risk as in the cooling department. However, this risk rate for the boring department would perhaps be too low in ordinary circumstances. It was developed during more than a year's operations with an unusually well selected class of workers.

In the fourth and last TNT group are those employed in scraping free the particles of TNT adhering to the threads in the orifice of the filled shell and thereafter engaged in shellacking the TNT cavity by means of a long-barrel air-pressure pistol that sprays on the shellac. This is a departmental process that liberates a great amount of TNT fume, a medium amount of TNT dust, and a considerable amount of tiny TNT crystals. About 30 per cent of all the TNT process workers are employed in this department. In the

plant studied, the charge-shellacking department, operating under improved methods, had a yearly risk rate of 17 cases of TNT poisoning for every 100 jobs. This implied a risk about half as great as in the boring or in the cooling department and about one-fourth as great as in the melting and pouring department.

The TNT risk rate for all the other production departments combined was 3 TNT cases in every 100 jobs during a year.

Conditions at every shell-loading plant should be so amended that the risk rates just cited as obtaining in the TNT departments under improved conditions should not be exceeded and, wherever possible, should be lessened.

The earlier risk rates, and these were under conditions better than at most loading plants, were: In the melting and pouring department 84 as against the improved-period rate of 64; in the cooling department 81 as against 33; in the boring department 131 as against 33; in the charge-shellacking department 125 as against 17; in the non-TNT departments 8 as against 3.

The improved conditions included operations under further perfected sanitary conditions, with dust and fume removal by means of vacuum devices, the reduction of work periods to eight-hour shifts, a 30 per cent increase in pay and a reduction of 24 per cent in the actual number of workers employed, a materially larger plant output and at a reduced cost rate, and a lessening of the TNT risk 24 per cent in the melting and pouring department, 60 per cent in the cooling department, 75 per cent in the boring department, and 86 per cent in the charge-shellacking department, with an accompanying reduction of 78 per cent in the TNT risk rate for all the other production departments combined.

In four of the five instances cited the risk rate was reduced between 60 and 86 per cent. In the melting and pouring department it appears to have been reduced only 24 per cent. This very fact may reveal a condition of great importance in a study of the manner in which TNT poisoning affects the worker. The melting department is where TNT escapes mostly in vapor. In that department, in addition to pouring molten TNT into shells, a few of the workers are also occasionally employed in melting imperfect TNT charges out of shells rejected by scrutinizing inspectors. But during the improved period at this plant the melting department also melted the TNT charges out of 250,000 shells that had been unsatisfactorily loaded by other companies.

What this means in TNT vapor liberation will appear. During those 20 months of operations this plant showed a generally uniform unrecovered waste of 2.31 per cent of all the TNT handled in

the various stages of the loading processes. Just how much of this escaped in vapor or in fume or in spattered particles of molten and then cooled TNT, or in unrecoverable dust, is not known, but it is known that during the melting out of those 250,000 charges 10 per cent of the TNT was not recovered and presumably was lost in vapor in the open-shed annex in which the work was performed.

During the first period, which lasted $7\frac{1}{2}$ months, there were 340 jobs in the production departments, 503,020 shells were loaded, 20,121 pounds of TNT was somehow dispelled or wasted and lost, 115 cases of TNT poisoning occurred, the average daily output was about 2,000 complete rounds of cannon ammunition, and the greatest single day's output was 6,300 complete rounds.

During the improved period, which had continued $12\frac{1}{2}$ months when this study terminated, there were 260 jobs in the production departments, 1,242,422 shells were loaded, 250,000 shells had their loads melted out, 49,697 pounds of TNT were dispelled or lost in the loading process, and 45,750 pounds of TNT escaped in the melting-out processes, 54 cases of TNT poisoning occurred, the average daily output was about 4,000 complete rounds of cannon ammunition, and the greatest single day's output was 10,256 complete rounds.

CLIMATIC HANDICAPS IN MUNITION DISTRICT.

Climatic conditions seem to have significance in TNT liability. How much they affect the process work and how much the resisting power of the worker exposed to unusual weather conditions while in transit to and from work remain to be determined.

But because the plant studied happens to be practically at the heart of the district where TNT is used in loading shells it is a matter of special interest to know just what are the variable climatic conditions under which practically all such work will have to be performed during America's manufacture of high-explosive shells.

Charts are given at the end of this article showing both periods of operation, the maximum and the minimum temperature each day of the 20 months, the measurable rainfall and the snowfall or the trace of either occurring any day, and, in encircled figures, the number of TNT poisoning cases occurring on the days indicated.

Health and comfort for the workers and productive efficiency for the whole shell-loading industry may be better planned when it is known that those who go into this necessary work, either men or women, or both, will have to work in a zone that had 120 frigid days in the year ending in September, 1917, 12 of them when the temperature ranged from 10° F. to a little below zero. During this year there were 80 hot and humid days when the temperature mounted

above 80°, 12 of the days having temperatures between 90° and 98° in the shade and two degrees hotter in the TNT departments. Rain fell 120 days, more than one-third of those days in hot weather, and the total rainfall for the year measured 50 inches. The total depth of snowfall during the year was 52 inches, and there was snow on the ground about 40 days.

Most of the shell-loading plants are in unattractive and comparatively isolated neighborhoods, poorly supplied with habitable quarters, and there is usually long daily transit to and from work, in dirty or cold or poorly ventilated and overcrowded vehicles. Rents are unwarrantably high because of the unfounded belief that munition workers are paid fabulous wages. At the loading plant studied the maximum pay for workers in the TNT departments rose to \$3.25 to \$4 a day, which was about double the amount similar manual labor had been paid in that neighborhood before the war.

In order steadily to produce the enormous number of high-explosive shells needed these munition-zone problems must be better understood, and it is especially necessary, if women have to go into this industry, that general conditions be improved.

Look carefully at the charts. The frigid periods are diagonally crossmarked with parallel lines and framed by heavy dark lines. The hot and humid periods are perpendicularly crossmarked and framed by wavy lines.

For example, note the last column of the first chart and trace across from the first column opposite the ninth day of the month. It shows that September 9 had a maximum temperature of 77°, a minimum temperature of 62°, a rainfall of 0.08 of an inch, and 22 cases of TNT poisoning occurring that day. It was not a hot day, but it was preceded by a very hot day with rain, indicating much humidity, and for 10 days preceding that unusual outbreak of TNT poisoning there had been continuous hot and humid weather. Incidentally it should be known that September 9 was a Saturday immediately following one of the plant's usual semimonthly Friday pay days.

Look further down on the chart of the later period and opposite the caption "Shell output per poison case." The amounts given to the right show the relative number of shells loaded any one month to each case of TNT poisoning developed. In October there were 95,000 shell loadings but no case of TNT poisoning. The poison risk during that fine-weather fall season was remarkably small; but the risk increased with the increase of winter rains. The monthly ratio was about 30,000 loadings to each poisoning in January and February, with a poorer showing in March. That was a time when the plant was working on two different contracts for shells of pre-

cisely the same character and only distinguished by tiny differences. It was a period of much confusion and crowding. It may be that these annoying conditions reacted upon the workers to an extent that the worry affected their physical state.

Some of the biggest output days occurred when the product was moving smoothly along through the departments and workers could be heard occasionally singing snatches of song. Possibly one of the causes for the large risk rate in the melting and pouring department was the presence there for many months of a diminutive foreman of the military martinet type, skilled in TNT and energetic and educated, but possessed of a most remarkable aptitude for insulting and irritating workmen, and to such an extent that his personality was responsible for many men's quitting or refusing to work in that department.

In April and May of the second period there were altogether eight cases of TNT poisoning. Five of those eight cases occurred in the melting and pouring department, and it was during those two months that 225,000 loads were melted out of shells.

This article might now be concluded with a summary of general recommendations thought advisable for adoption by all the shell-loading plants, but enough has been suggested in the general treatment of the subject of TNT poisoning to show that it is a great industrial and medical problem, and that involved with the possible saving of several hundred lives is the possible saving for the Government of some \$4,000,000 in TNT values.

Following are the charts mentioned above, showing weather conditions for each day during 20 months at the shell-loading plant studied. This establishment is located in the heart of the munition district and is considered one of the safest plants engaged in handling high explosives in the United States.

In explanation of the charts it may be stated that chart No. 1 covers the first $7\frac{1}{2}$ months of the period under consideration, during which the employees worked 10-hour shifts. Many health-protective devices were used during this period and labor fluctuated greatly. The second chart represents $12\frac{1}{2}$ months of improved conditions, with 8-hour shifts. Maximum and minimum temperature are indicated by the lower figures in each daily square, while the upper figures show the inches of snowfall or rainfall, those on the left showing rain and those on the right, snow. A trace of snow or rain is represented by a T.¹ Frigid periods—that is, periods when the minimum tem-

¹ This record was compiled and arranged by Archie Rice, of New Brunswick, N. J. The snowfall measurements and other climatological data were taken from records made by the New Jersey State Agricultural College.

perature was 32 degrees or lower—are diagonally cross marked by parallel lines and surrounded by heavy black lines, and hot, humid periods are perpendicularly cross marked and surrounded by wavy lines. In the lower sections of the chart are summarized by months the number of cases of TNT poisoning, the total number of shells loaded, and the average for each case of poisoning, together with cases of burns and accidents, the number of frigid and of hot, humid days, and other weather conditions.

CHART 1.—TNT POISONING CASES AS RELATED TO WEATHER CONDITIONS DURING 7½ MONTHS IN A SHELL-LOADING PLANT WITH 10-HOUR SHIFTS.

[Upper left-hand figures in squares show inches of rain and right-hand figures inches of snowfall; T=trace; lower figures show maximum and minimum temperatures.]

DOPE POISONING IN THE MAKING OF AIRPLANES.

BY ALICE HAMILTON, M. D.

INTRODUCTION.

For the most part the manufacture of airplanes is quite devoid of risk to the health of the workers, consisting as it does of carpentry, upholstering, varnishing, and metal work. There is only one point at which poisons are encountered and that is when the substance called "dope" is applied to the linen which covers the body, wings, rudder, etc. The purpose of the dope is to tighten the fabric so that it is absolutely smooth fitting and to render it waterproof. A good dope must be flexible and durable and must possess the property of making the fabric taut.

A great many varieties of dope have been used for this purpose and even now new ones are brought forward from time to time and tested, so that it is probable that formulas now in use may be changed within a short time. Any description of the doping of airplanes applies necessarily only to the present time, and it must be understood that the compounds used may be different six months from now. At present the base for dopes is almost always a cellulose compound, either the acetate or the nitrate. Neither of these is at all poisonous, but both must be dissolved in various volatile compounds which are more or less poisonous, exerting their action on the central nervous system or on liver, kidneys, and heart muscle, or on the constituents of the blood. These compounds will be described in detail later.

It was during the year before the war that physicians first heard of industrial poisoning in connection with airplane doping through reports in German medical journals. A new and startling form of poisoning had appeared in certain of the Johannisthal airplane works and some of the cases were fatal. Soon after the appearance of these reports, similar cases were published in British medical journals. Dope poisoning continued to be reported from both countries up to the early months of 1915, when information from German sources ceased. The British reports, however, appeared from time to time up to January, 1917, at which time the use of that particular form of dope was largely discontinued in England.

The form of poisoning described by the British and German physicians and physiologists, who made their observations quite independently, was the same in both countries. It consists in an acute degeneration of the liver with lesions in kidneys and heart muscle. In England it is known as toxic jaundice and in symptoms and pathology it is very like the toxic jaundice caused by trinitrotoluol poisoning. All of the early cases of dope poisoning were cases of toxic jaundice, but later, when medical examinations were made of all the dopers in order to detect the early stages of poisoning, it was found that there are other less serious and striking types of dope poisoning, characterized chiefly by nervous disturbances.

Although the airplane industry in the United States has been expanding greatly since the beginning of the war, no case of dope poisoning has come to the knowledge of the medical profession. It is of course possible that scattered cases may have occurred and failed to be recognized or reported, and it is also possible that the American dopers have so far escaped poisoning because they did not work long or continuously or in an atmosphere heavily charged with fumes. It may be that as the number of men engaged in doping increases and their work grows more continuous, instances of dope poisoning may appear as they did in Germany and England, unless at the outset precautions are taken to prevent such an occurrence. For these reasons, the Bureau of Labor Statistics instituted an inquiry into the work of doping airplanes as it was done during the spring and summer of 1917, in order to discover what kinds of dope were used, what precautions taken, and whether there was any evidence of dope poisoning in American airplane works.

In the course of this inquiry 18 factories were visited, situated in Illinois, Michigan, Ohio, Florida, New York, New Jersey, Rhode Island, and Massachusetts. The greater number of these were small, some of them only experimental, and they employed no more than one man each in doping and usually for only part time. A few employed as many as 10 dopers. The industry was in process of rapid expansion and hardly any of the plants were at that time in permanent quarters: all were planning to enlarge if their expectations as to Government contracts were fulfilled. This means that the conditions found during the spring and summer of 1917 were temporary and in most cases have already changed. It is fair to say that at that time the doping rooms were passably ventilated, considering the amount of work that was being done, but in many instances the ventilation provided would not be sufficient if doping were continuous and a dangerous kind of dope were used.

The men in charge of these works all realized that there are risks involved in doping, but few of them knew which kind of dope is

the most dangerous, and most of them were willing to trust to natural ventilation to carry off the fumes. As the visits to these plants were made during mild weather, when the windows could be opened, conditions were at their best. No doping room was seen so small and crowded and close as to make one fear for serious poisoning among the dopers, but in cold weather and during a rush of work the state of things would be very different.

Before describing the factories visited it will be best to discuss the various dopes in use in this country, for, obviously, much more scrupulous care must be taken with a decidedly poisonous dope than is necessary with one less poisonous.

DESCRIPTION OF AIRPLANE DOPES.

There are at present three kinds of dope in use for airplanes. The first is the one which was in general use before the war, cellulose acetate dissolved in a mixture of solvents, the most important compound of which is tetrachlorethane. This dope has the advantage of being relatively noninflammable and therefore adapted for use on war planes. The second is acetate of cellulose dissolved in a mixture which does not contain tetrachlorethane, but consists of acetone, alcohol, and benzol. The third is cellulose nitrate dissolved in amyl acetate with usually acetone, or other ketones, alcohols, and benzol. Cellulose nitrate is inflammable and the surface doped with it must be covered with a noninflammable varnish, but even so, nitrate dopes are not considered appropriate for war planes, though they are very generally used for training planes.

These solvents differ very much in their poisonous properties for human beings, but all, with the possible exception of acetone, come under the head of volatile poisons, which produce their effect when breathed or when absorbed through the skin, as well as when swallowed.

PHYSIOLOGICAL EFFECTS OF DOPE SOLVENTS.

TETRACHLORETHANE ($C_2H_2Cl_4$).

K. B. Lehmann,¹ probably the greatest expert on volatile industrial poisons, determined by experiment the actual toxicity of this compound, several years before general attention had been called to it by poisoning in the aircraft industry. In 1911 he administered tetrachlorethane to cats, through the skin and by inhalation, and found that it set up serious disturbances of metabolism, with decided loss of weight. Bile coloring matter and albumen appeared in the urine, and sometimes hemoglobin. There was solution of red blood cor-

¹ Lehmann, K. B., *Archiv. für Hygiene*, 1911, vol. 74.

puseles and basophilic granulation: fatty infiltration and degeneration of the liver; the heart muscle was yellowish; the kidneys congested. Minute hemorrhages took place into mucous and serous tissues.

Lehmann found that if there was not more than 1 to 2 milligrams of the vapor to a liter of air, the cats could breathe it for a relatively long period—six or seven hours a day for 18 days spaced over four weeks—and show no more serious symptom than loss of weight and drowsiness. If the strength of the fumes was increased, the symptoms were like those following chloroform inhalation, only it is more toxic than chloroform. Tetrachlorethane is the most poisonous of the chlorine derivatives of the hydrocarbons, being four times as toxic as chloroform and nine times as much so as carbon tetrachloride (tetrachlormethane).

In December, 1913, in an airplane factory in Johannisthal,¹ four out of a force of eight dopers were affected with hematogenous jaundice of a severe type and one died. The dope was applied to the wings by spraying as well as by painting and the work was done in a poorly ventilated room. The formula of the dope was secret, but analyses carried on in the University of Berlin showed it to consist of acetate of cellulose in a solvent containing 60 per cent of tetrachlorethane.

Heffter and Joachimoglu,² of the Pharmacological Institute of the University of Berlin, made experiments on dogs, using two commercial dopes, "Aviatol," which contained as much as 84 per cent of tetrachlorethane, and "Quittner's Emaillite B," also a tetrachlorethane mixture, and then pure tetrachlorethane. They administered the compounds by rubbing into the skin and by exposing the animals to the vapors. From dopes and from the pure substance they obtained the same results, namely, loss of weight, vomiting, bile and blood in the urine, death with fatty degeneration of the liver and hemorrhages into serous and mucous surfaces and into the heart muscle. When inhalation experiments were made, there was, at the beginning, a narcosis, slower in onset and less marked and less lasting as the days went on, the animal gradually becoming somewhat accustomed to the effects. After several days of inhalation, the other symptoms described above appeared and the course of the case and the changes found after death were the same no matter how the poison was administered.

The fatty degeneration of the liver found after such experiments is more marked than that produced by any substance except phosphorus and it resembles that of phosphorus poisoning by being asso-

¹ Jungfer, *Zentralblatt für Gewerbehygiene*, 1914, vol. 2, p. 222.

² Grimm, Heffter and Joachimoglu *Vierteljahresschrift für gerichtliche Medizin*, 3 Folge, 1914, vol. 48, Supplementheft, p. 192.

ciated with a yellow, flabby heart muscle and with acute degenerative change in the kidneys. There is also a striking resemblance to delayed chloroform poisoning, in which acute hematogenous jaundice is found. Tetrachlorethane has more than seven times the blood-dissolving power—for mammalian blood—than chloroform has.

During 1914 several instances of poisoning among dopers in airplane works were reported in German medical literature. Jungfer¹ told of one factory where 10 men were poisoned and 1 died. This man had worked only two months, with a dope containing 40 per cent tetrachlorethane. Some months later Grimm² wrote of a factory with 15 dopers, all but one of whom had suffered from the effects of the dope and the one who had escaped had been at work only four weeks. Two had died. They were using Aviatol and Emaillite.

Grimm gives the details concerning 18 cases of dope poisoning, with two deaths, the symptoms being as follows: Gastric disturbances—nausea, inclination to vomit, tenderness over the stomach—16; jaundice, 8; bile in urine, 9; anemia—hemoglobin from 60 per cent to 80 per cent—5; muscle tremors, 5; numbness, 3; abnormal reflexes, 4; nephritis, 2; slight motor paralyses, 3; heart weakness, 1. Those who had nervous symptoms had no gastrointestinal symptoms. The dopes contained 40 per cent, 60 per cent, and 84 per cent tetrachlorethane.

He says that after these distressing occurrences, two Johannisthal plants gave up the use of these dopes, but even so, four months later one of the workmen developed toxic jaundice. This long latency and the delayed development of the symptoms of poisoning have also been noted in connection with trinitrotoluol poisoning, as described in the discussion by the British Royal Medical Society.³ Men and women who had been away from the TNT works for weeks or months have had typical toxic jaundice, which in one case was fatal.

Koelsch,⁴ writing in 1915, divides cases of tetrachlorethane poisoning into two groups, (a) those with pronounced gastrointestinal symptoms, nausea, vomiting, abdominal cramps, enlarged liver, and jaundice; (b) those with slight abdominal symptoms or perhaps none, but with nervous disturbances of various kinds, headache, paresthesia, trembling hands, reflex disturbances, slight paralyses. He speaks of two cases belonging to the first group that were mistaken for lead colic. He also mentions as a symptom an increased

⁴ Koelschen, *Münchener medizinische Wochenschrift*, 1915, vol. 62, p. 1567.

appetite for food, coincident with a loss in weight. One of his cases belonging to the second group had only slight gastric symptoms, pain in the stomach and slightly yellowish skin. His chief complaint was of drowsiness persisting all the time he was at work, feeling of crawling in the throat, tremors of the hands, and various neurasthenic symptoms. One employer had used amylacetate dope at first but his men complained that it made them cough and their eyes smart and water, so he had substituted tetrachlorethane and after four weeks one of them developed acute inflammation of the liver.

The use of tetrachlorethane was forbidden in the Tetlow department (Kreis) temporarily by order of the factory inspection department till the effects could be more closely studied.

This report of Koelsch's cases in 1915 is the last that has come to us from Germany. At that time the factory inspectors and sanitarians were strongly in favor of prohibiting the use of tetrachlorethane dopes. We do not know whether this was done. If it was not, then the enormous expansion of the aircraft manufacture of Germany during the last two years must have been attended with a great deal of industrial poisoning.

Great Britain's experience has been very similar; but in her case we have been able to follow it to its logical end, the abandonment of tetrachlorethane dopes. The first report of poisoning from this substance in the airplane industry was in October, 1914, when a man died of acute jaundice in an airplane factory in Hendon. He was 36 years old and had worked 11 weeks when he was found to have jaundice and an enlarged liver. Three weeks later he died and the liver was found to be shrunken and green. Inquiry revealed 10 more cases of inflammation of the liver in the same plant, all men. Their ages were between 23 and 58 years, with four of them over 45 years. The shortest period of exposure before illness came on was three weeks, the longest, 16 weeks. All these cases were of the gastric type and all had jaundice. Indeed at that time no other type of dope poisoning would have been recognized.

Dr. T. M. Legge, chief medical inspector of factories, suggested that the dope was probably responsible for the illness, and experiments made on animals showed that the poisonous constituent of the dope was tetrachlorethane, capable of producing degeneration of liver and kidneys.

The second fatal case in England was a girl of 19 years, who died with all the symptoms of acute yellow atrophy of the liver. She began work in August, was jaundiced in December, and died January 2. The third, a girl of 17, had a similar history. She had worked four months. The fourth was a woman of 34 years who had been

working overtime, through the fall months. She began to feel sick in December, became jaundiced, and died in coma the first day of the year. The fifth death, reported early in 1916, was that of a man of 60 years, employed in taping, who died 13 days after he first consulted a doctor, complaining of diarrhea, vomiting, and great prostration. He had worked barely three weeks.

In February, 1916, "toxic jaundice" was made a notifiable disease in Great Britain, and "dope poisoning" was brought under the workmen's compensation act. It was stated by the Home Office then that 43 cases were known to have occurred, and seven deaths, five of them of women. The report for that month warns of the dangers to tapers, who do not use a great quantity of dope, but whose faces must be near it all the time, because the work is fine. No near-sighted person should be employed in taping. At least three deaths have occurred among tapers.

The dopes in use in Great Britain were made with cellulose acetate, dissolved in benzol, acetone, methyl alcohol, and tetrachlorethane. Wilcox,¹ senior scientific analyst to the Home Office, exposed rats to the vapor of all four of these substances. Those that were in the vapor from dope reacted in the same way as those in tetrachlorethane vapor. They grew drowsy and slept all day, not reviving entirely when taken out at the end of eight hours. After a week of this treatment they were drowsy and could not coordinate their movements, but revived later and ate normally. They did not, however, gain in weight. The rats kept in acetone vapor, and those in methyl alcohol and those in benzol, were also drowsy, but they would revive quickly each day, feed well, and gain weight, nor did they show any incoordination of muscles. All were finally killed, and while the last three groups showed no organic lesions, those exposed to tetrachlorethane vapor had fatty degeneration of the liver and kidneys. The animals which had breathed dope vapor showed the same changes, only less marked. Other rats exposed to the vapor for as long as five weeks showed decided shrinking of the liver. These experiments, as did the similar ones in Germany, established the fact that it was tetrachlorethane in dope that was responsible for this new form of industrial poisoning.²

Tetrachlorethane dopes continued to be used in Great Britain, but under far better conditions than formerly, for the Home Office insisted on more ample ventilation, to be provided by means of down

¹ Wilcox, in *Lancet* (London), 1915, vol. 1, p. 544.

² Wilcox gives as the distinctive features of this form of hematogenous jaundice in man: A slow, insidious onset; long duration of the disease after the onset, longer than in acute yellow atrophy of the liver; the absence of marked fever, distinguishing it from infectious jaundice, Weil's disease; the absence of such anemia as would be found in arsenical poisoning. The jaundice is deeper than that which accompanies delayed chloroform poisoning.

suction, since the vapors of tetrachlorethane are heavier than air. The Home Office inspectors found that a plenum system of ventilation simply resulted in a wide distribution of the poisonous fumes, so that workmen who were not employed in doping were forced to breathe dope fumes. They insisted that the air in the doping room must be changed 30 times an hour, and that all work, except doping, must be excluded from the doping room, and that doping of all kinds, including taping, must be done in this room. According to their observations as small an amount as 10 or 12 per cent of tetrachlorethane in dope is dangerous.

In August, 1916, a member of the Government stated in Parliament, in response to a question, that: "Considerable progress has been made in the production of satisfactory dopes of a nonpoisonous kind, and the Admiralty and War Office have recently issued instructions to contractors specifying various nonpoisonous dopes which meet their requirements. The effect of these instructions is that the use of dope containing tetrachlorethane is no longer permitted for military or naval air service unless nonpoisonous dopes can not be obtained. Of eight doping schemes approved seven are now supplied by the trade."

The latest information from England, in a letter from Dr. T. M. Legge, chief medical inspector of factories, written January 10, 1917, is to the effect that tetrachlorethane dope has been eliminated in aircraft works, and there has been little or no trouble among dopers since then. The Home Office, however, still thinks it necessary to insist on the same forms of artificial ventilation in doping rooms and on the fortnightly medical examination of dopers, inasmuch as the new dopes contain volatile poisons, though not as dangerous as tetrachlorethane.

The best solvent for cellulose acetate, if tetrachlorethane can not be used, is a mixture of methyl acetone (or methyl alcohol, methyl acetate, and acetone), benzol, and alcohol. By far the most toxic compound in such a dope is the benzol.

BENZENE OR BENZOL (C_6H_6).

This solvent, a coal-tar product, is a more powerful poison to the central nervous system than any substance used in airplane dope. Very rapidly fatal cases of industrial benzol poisoning have been reported in the literature, showing that a few minutes' exposure to heavy fumes may mean death. Less dense benzol fumes cause dizziness; roaring in the ears; excitement like that of alcoholic intoxication, sometimes angry, sometimes foolish, followed by the same depression and discomfort that come after a bout of drinking.

The amount of benzol in airplane dope is not likely to be more than 12 or 15 per cent, and we would not therefore expect severe

acute poisoning from its use. The milder forms of acute poisoning just described would be more probable and perhaps also the symptoms of chronic benzol poisoning, such as is seen among rubber workers. This chronic poisoning causes disturbed digestion, loss of weight, loss of appetite, tendency to fatigue after slight exertion, vague nervous symptoms, weakness, lowered resistance to infectious diseases. It is probable that the underlying disturbance is a profound anemia, for it is characteristic of benzol that it has a destructive action on the constituents of the blood, both the red corpuscles and the white. It also injures the blood vessels and in severe cases of both acute and chronic poisoning there may be hemorrhages under the skin or from mucous surfaces.

Industrial poisoning occurring among the users of cellulose acetate dope which has no tetrachlorethane might be due to other solvents in the dope, but the presence of benzol must always be taken into consideration, for it is the most dangerous of the solvents used.

ACETONE: OR DIMETHYL KETONE ($\text{CO}(\text{CH}_3)_2$).

This is the principal solvent used in these cellulose acetate dopes. It may be present as chemically pure dimethyl ketone, or as the so-called methyl acetone, a mixture of methyl alcohol, methyl acetate, and acetone.

Pure acetone is probably the least harmful compound used in dope solvents. Koelsch¹ could find no proof of danger in the use of acetone in industrial processes, no effect upon the workmen except possibly burning of the eyes and headache. Kobert,² the great authority on poisons, says that no case of acute poisoning from acetone, either deliberately or accidentally absorbed, is on record and he believes that such an occurrence is hardly possible. My own experience has been with men using acetone in the making of certain kinds of smokeless powder. They look upon it as completely harmless, not one of them attributing to its use any disturbance of health. In one factory I was told that they often used acetone to wash out a foreign particle from the eye, and in another, the factory physician told me that he took acetone for dressing minor injuries when his iodine gave out and found it a good substitute.

METHYL ALCOHOL OR WOOD ALCOHOL (CH_3HO).

In single large doses methyl alcohol is less poisonous than ethyl (grain) alcohol, but in small repeated doses it is decidedly more poisonous.³

¹ Koelsch, Concordia, 1912, vol. 19, p. 246.

² Kobert: Die Intoxikationen, p. 95.

³ Nicloux and Placet, Comptes rendus de la Société de Biologie, 1912, vol. 2, p. 63.

It is often claimed by industrial users of wood alcohol that the effects following the breathing of fumes are caused by the impurities contained in commercial wood alcohol, and that the pure alcohol is harmless, but this has been conclusively disproved by Reid Hunt, who found the chemically pure article producing all the characteristic symptoms of wood alcohol poisoning.

Pohl² says that the chronic poisoning of wood alcohol is quite different from that of the other alcohols. Ethyl, butyl, and amyl alcohol may be tolerated by animals for months, but methyl alcohol given in repeated doses can be tolerated only a few weeks. The animals cease to feed, then they fall into a coma lasting for days, and finally die, the liver having undergone extensive fatty degeneration.

In human beings the most striking effect of wood alcohol is on the eye. Lewin³ says that this action on the eye is more characteristic and occurs with greater certainty than does the effect of almost any other poison, and this is true whether the alcohol be swallowed or breathed. There is often a conjunctivitis, which may later be purulent; the pupil dilates and does not react to light or to accommodation; the sight is blurred; the field of vision decidedly contracted especially for certain colors. Ophthalmoscopic examination shows distension of the retinal vessels with dark blood, blurring of the disk, in severe cases marked retinitis with edema.

The clouded vision comes on suddenly and may pass away in the open air, returning again in the atmosphere of the work-room. Exposure to heavy fumes is sometimes followed by permanent impairment of sight, even total blindness. There are many cases of industrial poisoning from wood alcohol reported in American medical literature that resulted in partial or complete blindness or in death.⁴

Accompanying the eye symptoms there is usually more or less headache, a feeling of weariness and of muscular weakness, pain in stomach and back, dizziness. If the fumes are heavy, the symptoms are more serious—abdominal cramps, nausea and vomiting, chills, uncontrollable drowsiness, even coma. Delirium is rare. In ordinary wood alcohol poisoning fainting does not occur, but there is dizziness, confusion, roaring in the ears, blurred sight, staggering gait. Occasionally the fumes cause bronchial irritation, even bronchopneumonia.

Tyson, H. H., and Schoenberg, M. J., Journal American Medical Association, 1914, p. 915.

It is an unsettled question what proportion of wood alcohol constitutes a dangerous amount. Denatured alcohol in the United States usually contains from 4 to 10 per cent of wood alcohol and it is generally assumed that this is within the poison limits. Yet the denatured alcohol of Germany which contains only 2 per cent has caused trouble among the workers using it. According to Goldschmidt¹ there has been a great deal of complaint of ill health among workmen using denatured alcohol, so much so that petitions were sent to both the Bundesrath and the Reichstag, asking for a governmental inquiry into the harmfulness of alcohol denatured in this way. Lewy,² writing in 1891, gives much the same information concerning the use of denatured alcohol in industry in Austria. The Austrian formula for this alcohol calls for the addition of 2 per cent wood alcohol and one-half per cent pyridin bases.

Lewy states that the reports of sickness caused by the use of this denatured alcohol in industrial establishments in Bohemia induced the Austrian Ministry of the Interior to undertake an inquiry, the results of which confirmed the reports of ill health and blindness following work with denatured alcohol. The poisonousness of the pyridin bases and of the impurities contained in crude wood alcohol are admitted, but the effect of methyl alcohol itself is said to be predominant and to be regarded as the principal effect. In Germany and in Austria, countries in which the industrial use of denatured alcohol is very widespread, mixtures containing as little as 2 per cent of wood alcohol have been found to be dangerous.

These are the principal substances that make up the solvents for cellulose acetate when tetrachlorethane is not used. Small quantities of other compounds may be added to act as stabilizers for the dope. For instance, from 2 to 5 per cent of ethylchloracetate ($\text{CH}_2 \text{ Cl COO C}_2 \text{ H}_5$) is said to have this stabilizing effect. Ethylchloracetate has a markedly irritating action on the eyes. Other compounds which may be used for this purpose are benzyl acetate, benzyl benzoate, and acetanilid, none of which would probably be harmful when used in this way. Hexachlorethane, said to be far less poisonous than the tetra compound, is sometimes used, and also paradichlorbenzol. This last is decidedly irritating to the skin, but it is doubtful whether so small an amount as 4 per cent would do any harm.

Coming now to the cellulose nitrate dopes, which are commonly used for training airplanes, we find that the solvent that bears the same relation to cellulose nitrate as tetrachlorethane does to cellulose acetate is amylacetate, commonly called banana oil. Combined with it may be acetone, amyl alcohol (the so-called fusel oil), methyl

¹ Goldschmidt, Weyl's Handbuch der Hygiene, vol. 8, p. 830.

² Lewy, Medizinisch-chirurgische, Rundschau, 1891, vol. 32, p. 508.

alcohol, grain alcohol, and benzol. Of these, acetone, methyl alcohol and benzol have already been described.

AMYL ACETATE ($C_7H_{14}O_2$).

Amyl acetate is familiar to varnishers and workers in shellac and lacquers under the name of banana oil. Many men object very much to its heavy, sweet odor, and irritating effect on eyes and throat. It is probably because of this penetratingly sweet odor that the men attribute any unpleasant effects they may experience in the use of cellulose nitrate dopes to the banana oil, though there may be much stronger volatile poisons present, such as benzol or methyl alcohol, their presence being masked or covered over by the amyl acetate.

Amyl acetate has toxic properties, but they are slight. We have no evidence of dangerous acute symptoms following the breathing of large quantities of vapors nor of organic diseases following long continued exposure. Koelsch¹ of the Bavarian Department of Labor (*Landesgewerbearzt*), made a special study of amyl acetate, which he published in 1912. As he was able to find very little written about it, he made inquiries of the factory inspectors in Bavaria who came in contact with workers in lacquers, metal varnishes, in bookbinding, leather works, varnishes for frames, pencils, and pen handles. These inspectors told him that it was comparatively harmless, causing in rare instances drowsiness, dizziness, and headache, cough, feeling of tightness in the chest, and nausea. All these symptoms were worse in new men, as they quickly became accustomed to the vapors. They knew of no chronic organic trouble resulting from the use of amyl acetate.

Koelsch interviewed five workmen himself, all dopers in an airplane factory, using amyl acetate-acetone dope. One of them complained of weariness and occasional nausea and headache which he attributed to the odor of banana oil. The others had no complaint to make. Then he experimented on himself, vaporizing amyl acetate and breathing the fumes. The result was an inclination to cough, a feeling of heat in the head, and a slightly more rapid pulse. Later he grew dizzy, somewhat drowsy and confused and tired, with quick deep respirations. Going home at the end of the experiment, he found it difficult to mount the stairs.

To test it further, Koelsch made experiments on rabbits, exposing them to an atmosphere containing 0.5 to 1 per cent amyl acetate. The acute symptoms of air hunger and nervous irritation passed away quickly when the animals were taken out into fresh air. Guinea pigs exposed day after day to such an atmosphere for 10 hours each day, developed marked nervous symptoms, ataxia, motor paralysis, but not persistent after removal to fresh air. After many days (237 and

¹ Koelsch, *Concordia*, 1912, vol. 19, p. 246.

340 days) they lost appetite and grew thin. Two that died had fatty liver and edema of the lungs with areas of pneumonic consolidation.¹

Lehmann² finds the same comparative harmlessness of amyl acetate. He could not succeed in narcotizing rabbits completely with it, and death did not follow even so large a dose as 35 milligrams per liter of air. There was a good deal of irritation of the mucous membrane of nose, throat, eyelids and bronchial tubes, while larger doses produced alteration in gait, and partial narcosis.

His human experiments were slighter than Koelsch's. Two healthy young physicians breathed air with 5 milligrams of amyl acetate to the liter for half an hour. At first they felt an irritation of the throat, nose, and eyes, then dry burning in the throat, but no headache or nausea or change in pulse, and only a slight sense of weariness.

The smarting, burning, watery eyes complained of by men using nitrate dopes in airplane work are attributed by them to the fumes of amyl acetate, but it is evident from what has been said above that methyl alcohol may be the ingredient responsible. As for the general symptoms, it would be impossible to say which of the several volatile poisons, all of them with effects on the central nervous system, is the most active agent in any one case.

To sum up, workers in amyl acetate may be expected to complain of smarting eyes, running from the eyes, dryness of the throat, sense of tightness in the chest, and inclination to cough. More rarely they may feel drowsy and tired and vaguely nervous. Such symptoms as nausea, headache, vomiting, gastrointestinal distress, do not seem to be characteristic effects of amyl acetate. Nor have we so far any evidence of chronic organic disturbances in human beings as a result of long-continued exposure, though experiments on animals point to the possibility of such occurrences.

AMYL ALCOHOL OR FUSEL OIL ($C_5H_{11}OH$).

Marshall³ gives the following list of alcohols with their fatal doses, calculated per kilogram of animal weight.

	Grams.
Methyl alcohol (CH_3OH)-----	6.00
Ethyl alcohol (C_2H_5OH)-----	7.75
Propyl alcohol (C_3H_7OH)-----	3.75
Butyl alcohol (C_4H_9OH)-----	1.85
Amyl alcohol ($C_5H_{11}OH$)-----	1.50.

¹ Heffter and Joachimoglu in connection with their experiments on dopes tested also amyl acetate on two dogs. The animals showed irritation of the conjunctiva and at first they lost weight, but recovered. Killed on the ninth and eleventh days they showed no anatomical changes.

² Lehman, K. B., *Archiv für Hygiene*, 1913, vol. 78-79, p. 200.

³ Marshall, quoted from *Memoires des Poudres et Salpêtres*, 1912, vol. 16, p. 128.

Fusel oil is therefore four times as toxic as wood alcohol and five times as toxic as grain alcohol.

Salant,¹ who tested amyl alcohol and ethyl alcohol on animals found an even greater disparity between them. For frogs the minimum fatal dose of amyl alcohol is only one-seventh to one-eighth that of ethyl alcohol, and for rabbits one-fourth. It is a poison to the central nervous system, causing symptoms like those of ordinary alcohol, but it is more rapid in its effects, severer, and accompanied by a more decided fall in blood pressure.

All the three varieties of dope are in use at present in the United States. The large numbers of airplanes for use in training aviation are covered with nitrate dope. The war planes which are just beginning to be constructed will probably be covered with acetate dope free from tetrachlorethane. Cellulose acetate dope with tetrachlorethane as solvent is still used in a few American factories, but it is probable that if sufficient quantities of other solvents can continue to be produced the use of tetrachlorethane will be abandoned in the near future. The United States Signal Corps gives the preference to the tetrachlorethane-free acetate dope for war planes. This is, however, the situation at the present moment. When the inquiry was made for the Bureau of Labor Statistics between April and September, 1917, only two kinds of dope were in use to any great extent, namely, cellulose acetate tetrachlorethane dope and cellulose nitrate-amylacetate dope, for at that time the airplanes in course of manufacture were either for training purposes or were purely experimental. The majority of factories used nitrate dope.

DOPE POISONING IN AMERICAN AIRPLANE WORKS.

Doping is simply painting fabric with liquid dope. Usually five or six coats are applied and there is an interval of an hour or so between coats to allow for drying. If only one part is to be doped the men go outside during this hour and do other kinds of work, but if there are several they pass on to another part and work continuously. Obviously the larger the number of parts drying the heavier the fumes in the doping room. The British regulations advise drying the doped parts in a room separate from the doping, but so far this is not done in American plants.

In one large doping room the foreman had placed all the wings that were drying in a vertical position instead of horizontally, as is done in most places, because he said that in this way not only was drying quicker, but the heavy fumes of the tetrachlorethane would sink to the floor and not poison the air.

¹ Salant, Proceedings Society Experimental Medicine & Med., New York, 1909-10, vol. 7, p. 134.

"Taping" is applying narrow strips over the stitches in the linen, the dope being used to glue the strips fast to the fabric. Some men prefer this to "big work," doping wings, but others say that holding the head close to the fabric, as one must in taping, makes one breathe in more fumes. An experienced man can save himself a good deal from the fumes in doping by placing himself in such a way that they are drawn from him, not toward him. He begins work at the end nearest the exhaust, not the far end, so that as he works back the fumes are always between him and the outlet.

When the atmospheric humidity is high, drying of the dope is delayed. The best conditions for doping are a temperature between 75° and 85° F., with a fairly low humidity and no strong currents of air. Nevertheless it is evident that these conditions are not necessary, for much of the doping in this country is still done out of doors, or in open sheds, at the mercy of the weather. No scientific air conditioning is thus far provided in any plant.

The bureau of statistics and information of the New York State Industrial Commission, in their bulletin for June, 1917, publish a report of an inquiry "into the danger of the aeroplane industry from a hygienic standpoint." The investigators were Dr. Lester Roos and Dr. Rosalie Bell, of the medical inspector's staff. They visited eight factories in the State of New York, three of which were very small, the others employing, respectively, 5, 6, 7, 12, and 40 to 50 dopers. In two factories tetrachlorethane dopes were used, with six men engaged in doping. In two of the smallest factories the nature of the dope was not ascertained, and in the other four, employing some 65 dopers, nitrate dopes were used with acetone as solvent, or mixtures of acetone and such substances as benzol, amyl acetate, fusel oil and alcohol.

Examination was made of 52 of these dopers and it is noted that some disturbance of health was present in 35. In some it was very slight, no more than a dark colored urine, or slight anemia, or yellowing of the skin, or reddening of the eyelids. About nine of the 35 could be so classed. The remaining 26 gave histories of symptoms of ill health referable to the central nervous system or to the gastrointestinal or urinary system as follows:

Dizziness.....	14
Headache.....	6
Drowsiness.....	6
"Overcome by fumes".....	4
Attacks of semiconsciousness.....	2
Attacks resembling alcoholic intoxication.....	2
Sense of weariness.....	1
Nausea.....	12
Vomiting.....	4

Loss of appetite.....	1
Burning in the stomach.....	1
Dark colored urine.....	1
Change in odor of urine.....	1
Burning micturition.....	1

Jaundice was observed in two and a third gave a history of former jaundice. One of the men with jaundice had dark urine. "Almost one month previously he was attacked with acute vertigo, syncope. He became nauseated and vomited. All the symptoms except the vertigo lasted for one day. One week ago he suffered a similar attack. On both these occasions he was compelled to remain at home. He complains at the present time of feeling weak, and having a highly colored urine. Physical examination shows a marked jaundice." This man was using cellulose nitrate dope free from tetrachlorethane.

The second case, less markedly jaundiced, had the following history: After one week's work with tetrachlorethane dope, he was attacked with dizziness and severe nausea. "Symptoms simulating alcoholic intoxication lasted twenty-four hours. Two weeks later while at work he was overcome for a period of two hours with an attack of vertigo and sleepiness. After three weeks more he had a similar attack and again showed symptoms resembling acute alcoholism for about three hours. He has highly colored urine at all times. Physical examination shows a slight jaundice." The dope in this instance contained tetrachlorethane.

In studying these cases, it is hard to determine which is the dope solvent responsible for the various symptoms. As we have seen, the characteristic effects of tetrachlorethane are gastrointestinal disturbances and jaundice. Nervous symptoms may also occur. The characteristic effects of solvents used with nitrate of cellulose are found chiefly in the nervous system. Benzol especially may cause a rapidly developing condition resembling alcoholic intoxication. The odor of amyl acetate is nauseating to some men, and both fusel oil and methyl alcohol fumes may cause vomiting, headache, dizziness.

No evidence of serious illness was discovered among these New York workmen, and no case of typical toxic jaundice, such as is described by British and German authors.

My own experience, covering three factories in which dopes with tetrachlorethane as the solvent were being used at the moment and in which about 15 dopers were employed, did not reveal any instance of toxic jaundice. The histories related to me did not even indicate an early stage of this disease; rather the symptoms were those of temporary intoxication and were referable to the central nervous system. I also interviewed men who had formerly used tetrachlorethane dope, though at the time they were working with the nitrate. They de-

scribed cases of poisoning in their own experience, or among fellow workmen, but these too were nervous in character, never jaundice with gastric trouble.

In view of the comparative newness of tetrachlorethane in industry it may be of value to describe the symptoms experienced by these dopers who had used it, even if the type of illness from which they suffered was light. Drowsiness, especially in hot weather, was more often mentioned than any other one symptom, and it was most troublesome in the early morning, passing away as the day went on. It was also worse after a holiday, the man having to go again through the process of accustoming himself to the fumes. One doper said that he was always drowsy for a while on starting work, then it passed away, but when he quit and went out into the open air the drowsiness would come over him again. Other men said they would fall asleep as soon as they reached home.

Several men told of having been made faint by the fumes so that they could work no longer that day, but always in these cases there had been some unusual circumstance that had encouraged absorption of the fumes. The room was closed and airless, or the weather very hot and humid. One man had lain down on the floor to paint the under surface of a wing, and thus breathed in the fumes which because of their heaviness always tend to fall to the floor. In another instance described doping was being done in a greenhouse and the men worked in a narrow aisle with wings stacked close on either side, drying or in course of doping, and the sun beat on the glass roof and walls.

The nervous symptoms were sometimes fairly severe, resulting in loss of consciousness, with temporary respiratory failure. Two men were doping wings in a room that had no artificial ventilation, and one of them was taken with dizziness and faintness and fell to the floor. The other, stooping to help him, upset the pail of dope, spilling some of it on the clothes of the prostrate man. Both had to be carried out into the open air, but the second man revived fairly quickly; the first was unconscious for a short time and had an alarming respiratory failure, so that artificial respiration had to be resorted to and his dope-soaked clothing removed before he revived. However, by the time the doctor arrived he was breathing again, and neither man experienced any lasting result from the accident, though both felt weak for several days.

Nausea and headache are likely to follow one of these attacks of dizziness and faintness, but symptoms of abdominal disturbance of any seriousness were apparently not present among the dopers I had an opportunity to interview.

Constipation was complained of only occasionally. Two men spoke of an increased craving for food at the same time that they were losing weight. Men who use tetrachlorethane dope for many weeks or months are said by fellow workmen to have a dull, "dopey" look in the eyes, which makes them recognizable at once.

The men using acetone-amylacetate-benzol-methylalcohol dopes did not complain nearly so often of dizziness, drowsiness, or attacks of faintness as did the tetrachlorethane men. For instance, there were nine men among the latter who gave a history of having been overcome by fumes once or oftener, while only three of the former gave such a history, yet there were more than four times as many men employed using these dopes as there were using tetrachlorethane dopes.

Some of the men using amyl acetate dopes complained of headache during the first hours of work, of cold hands and feet, of itching eyelids, watery eyes, feeling of dryness in the throat, and that vague sensation of drowsiness, slight nausea, and weariness, which they describe under the term "dopey."

There seems to be a general impression among the men who use tetrachlorethane dopes that they are less harmful than the dopes containing amyl acetate. The disagreeable odor of the latter and its irritating effect on the eyelids and on the throat are experienced at once, while tetrachlorethane, with its less overpowering odor, has no immediate effect, and seems to the workmen comparatively harmless. This opinion is shared by some physicians also, but it is quite wrong. Amyl acetate, though disagreeable, is not at all a dangerous poison, while tetrachlorethane is a slow, insidious poison to the cells of the liver and kidneys. Nevertheless, it is not at all unusual to hear a foreman say that he tried at first to use an amyl acetate dope, but had to give it up and take one with tetrachlorethane as a solvent, because his men could not stand the banana oil.

It must be remembered that the effect of these volatile solvents on workers in American airplane factories has not really been tried out. They have been exposed to fumes only at intervals and for short periods. Fifty-three dopers were asked as to the number of weeks or months they had been employed and all but five had worked less than a year. Seventeen had been doping for less than one month, 12 from one to three months, and 11 from three to six months, leaving only 13 who had worked over six months.

This is one reason why there has been no serious poisoning from volatile dope solvents in this country up to the present time. Another reason is found in the fact that much of the doping has been done in the open air, or under a shed with open sides, and so the fumes from the solvents were rarely heavy. Naturally since our entrance into

the war these conditions have changed, and we have no reason to think that we shall escape the experience of the British and the Germans with toxic jaundice if we continue to use tetrachlorethane dopes and do not adopt vigorous measures for the protection of dopers from fumes, for from now on there will be many men at work doping throughout their full shift, and they will be in rooms filled with dope-covered fabric. Nor are the other solvents free from danger. Indeed their poisonousness may prove to be greater than we now think.

The following is a brief description of conditions in the airplane industry in the United States as they were found in the spring and summer of 1917.

Of the 18 factories visited, 2 were not yet completed and it was not possible to find out anything about their plans of work, not even the variety of dope they intended to use. Five of the remaining 16 were using acetate dope with tetrachlorethane as solvent, the other 11 were using dopes with acetone, amyl acetate, benzol, and various alcohols—ethyl, methyl, or amyl.

About 75 men were employed as dopers, but the number in some factories was to be increased very soon and probably 90 is more nearly correct at this time of writing. However, even now not all of them are employed all their time in doping. The five factories using tetrachlorethane dopes are not the largest, and employ all told only about 16 men in these departments. Dopers are always men, and it is very rare to see a woman in the doping room, though occasionally she may work there at an emergency job of covering or repairing. No lads were seen in this employment, and no man under 21 years. Though we have no reason to believe that women are more susceptible to dope poisoning than men, the British experience proves that immature workers, those under 20 years of age, are decidedly more susceptible than adult men and women, so it is a matter for congratulation that thus far we have not employed boys and girls in our doping rooms.

In describing the ventilation systems now in use in doping departments it is necessary to bear in mind the temporary character of many of the present plants. Naturally, it is hardly worth while to install expensive artificial ventilation when the intention is to move soon into larger quarters. Six factories were in this condition; they were soon to be abandoned, while four more had just moved into new quarters and were not yet fully established. Five that were in permanent quarters had installed various forms of artificial ventilation, which it may be well to describe in full.

No. 1 and No. 2 have slotted floors with down suction. In No. 1 the doping room is large, about 160 by 30 feet, and the ceiling at the

peak is 18 feet high. There is a row of windows on one side, almost touching each other, and the panes in the middle were open at the time the visit was made, a cool day in early June, yet the air was oppressively heavy with banana oil. The floor, which was decidedly dusty, is built with three-quarter-inch cracks between each seven boards, the boards being 4 inches wide. These cracks are everywhere partly filled with dust and threads of fabric. There is a solid floor about 2 inches below the slotted floor, and the shallow space between has dirt and threads partly filling it. An elaborate double system of pipes is installed to supply and remove air. The intake system runs along the middle of the ceiling, sending in air heated to about 90° F. in a horizontal stream, while the pipes for removal of the air are placed along the floor. There are nine oblong pipes, about 18 inches by 8 inches, which run from the floor level to a larger pipe placed along the ceiling at the side, which meets in the center of this side wall a main pipe connecting also with a similar branch from the other side of the room. Here there is supposed to be a motor fan to produce suction, but at the time the visit was made no draft was perceptible at any point in the floor and the fumes were certainly not being carried off.

No. 2 has the same system, but in much more satisfactory form. Here the doping room is only partly separated from the main room by walls that stop short about five feet from the ceiling, which at this point, is about 20 feet high, while at the sides it is 11 feet. Four windows are on one side, two at one end. The floor has one and a half inch cracks every four feet and three inches below is the solid floor. In the outer wall of the room is a very powerful fan which exerts suction on the interfloor space, and this suction is so efficient that a small piece of paper poked through a crack is caught at once and appears in a few moments flying from the fan. The air is said to be changed every minute and certainly no fumes were perceptible at that time.

A simpler form of this kind of ventilation, which seems to work admirably, was found in a factory using tetrachlorethane dope—the two described above use amyl-acetate-acetone dopes. This doping room is separated from the rest of the factory but has a wide doorway into the main room closed only by a heavy canvas curtain. There are six windows on one side, and the room is 22 by 50 feet, the ceiling about 12 feet high. The air intake is from the upper sashes of the windows. The air is removed by down suction in the following way: Along the whole length of the floor in the middle of the room runs a wooden flue, about a foot high and 3 feet across, with cracks about three-fourths of an inch wide and 4 feet long at intervals. The suction is provided by a motor fan placed outside the

room at one end, and as soon as it is started the rush of air through the cracks in the flue is strong enough to make the heavy canvas curtain closing the door belly inward. Wings for doping are placed diagonally across the flue, which is not wide enough to impede the doper as he works. There are also two electric fans on the inner wall for use in very hot weather.

Three factories now building are to have some form of down suction through a slotted floor. Only one of these will be using tetrachlorethane dope.

In two plants there is a simple but effective system of ventilation by means of a fan so placed as to draw the air from near the floor level. One of these plants is situated on the sea coast and the doping shed has an unobstructed supply of air off the water. Doping is done in the second story of a building at the water's edge. This room is about 150 feet by 45 feet and the ceiling is 20 feet high. There is a wide double door at each end, one of them opening out toward the sea. Just in front of the door space, which is 8 feet high and 6 feet wide, is an old airplane propeller. The fan is set low, about 2 feet from the floor. Doping is done at the end of the room near the fan and then the wings are moved back to dry. The fan was running at the time, and the air was very fresh. The only spot where tetrachlorethane could be smelled was close to the doper.

In another factory no doping was being done at the moment, so that it was not possible to be sure how efficient the system actually was. The air intake here is from windows in the saw-toothed roof, and the suction fan, about 3 feet in diameter, is placed at the floor level opposite these windows. Seven wings were drying there and the odor of amyl acetate was not at all disagreeable.

Three fairly large plants depend entirely on window ventilation, though one of them uses the dangerous tetrachlorethane dope. In all three places the management is well aware of the risks involved in doping and expects to install an artificial system of air removal after the output has increased to the point where constant employment in the doping room will be required. At present dopers work for only a few hours a day.

As a rule, doping is carried on in a room or a building quite separate from the other workrooms, but in three plants it is done in the same rooms with the construction or sewing and covering. However, two of these factories were at the time they were visited still in temporary quarters. It does happen sometimes that simply as a matter of convenience a large wing may be doped in the assembling room, because it is difficult to get it into the doping room. In this case, of course, a good many workers who are not doping are obliged to breathe dope fumes. Last summer on a very hot day a woman work-

ing about 30 feet from a large wing that was being covered with amyl acetate dope fainted and was unconscious for about 20 minutes, although the assembling room is fully three stories high, and the manager thought the ventilation was abundant. Such an accident is quite unnecessary and should not be permitted. Doping should be confined to one room.

As long as a factory is in the experimental state, doping is often done out of doors, or in an open shed, very satisfactorily as far as the air supply for the workers is concerned. Sometimes these makeshift arrangements are not so good. One company used tetrachlorethane dope in a shed huddled down beneath a hill which cut off the air on one side and there were buildings close enough on two other sides to shut off the air on those sides. Another company was using an old paint shop on a crowded city street, and another an abandoned garage, surrounded by city buildings. But all these will either close down or secure better quarters, and in the meantime the exposure to dope fumes is so intermittent and short that it is doubtful if any real risk is incurred. If such conditions were to persist after construction had reached the degree it is expected to, then there would be a serious menace to the health of the dopers, especially where tetrachlorethane dopes are used.

Fumes are the dangerous feature in doping, but personal cleanliness should not be entirely neglected, and it is to be hoped that it will receive more attention in the future than it has up to the present. Only one plant visited had really adequate washing facilities for dopers—that is, hot water, soap, and towels. Eating in doping rooms is not usual, but sometimes men do take their lunch there, and this should, of course, always be forbidden.

The working day is usually nine hours. One plant was employing a night shift for 5 nights in the week, 12 hours a night. Since acetone-amyl-acetate dope is used here, the risk involved in such long hours is not so great as it would be if tetrachlorethane dope were used.

RULES FOR PREVENTION OF DOPE POISONING.

British experience is embodied in a series of recommendations for the control of doping in airplane factories, and it must be remembered that though these recommendations were framed to protect users of tetrachlorethane dopes, they have continued to be applied in airplane works even since the use of these dopes was abandoned and safer dopes substituted.

The following is an extract from Form 356, issued by the factory inspection department of the British Home Office in February, 1916:

DOPE POISONING.

Continued incidence of poisoning in aeroplane factories has led to the addition of the main symptom caused by tetrachlorethane—toxic jaundice—to the diseases which, if contracted in a factory, must be notified to the factory department. The occupier is required to report every such case to the district inspector and to the certifying surgeon, and the medical practitioner in attendance has also to report it to the chief inspector. (S. 73, Factory Act, 1901, and Order of Nov. 27, 1915.)

Not every symptom set up by tetrachlorethane, it should be observed, is reportable. The requirement is limited to the serious sign of jaundice, and in view of its unmistakable character the difficulty of compliance should be small.¹

The size of the aeroplane wings unfortunately makes it impracticable to remove the vapor completely, at the point of origin, by local exhaust which would carry it off without allowing any to pass into the air of the room. Reliance, therefore, in minimizing the noxious effect has to be placed on dilution of the air so as to keep down the tetrachlorethane and other vapors to a nontoxic proportion. The standard needed for securing this is 30 changes of the air of the doping room per hour. Where this standard has been secured and maintained for all processes in which tetrachlorethane in dope may be used, illness, if not altogether prevented, has ceased to cause serious anxiety. On the other hand, where it has fallen short of 20 changes, toxic jaundice has not failed eventually to show itself, except in the few factories where use of dope has been so intermittent as never to have exposed the workers to a toxic dose.

The means of ventilation must be mechanical, preferably by volume or propeller fans with free discharge to the open air. Owing to the high specific gravity of the vapor, the fans should be fixed at the floor level, or below this level where space allows the construction of large ducts under the floor. Air inlets, of the hopper type, the total area of which should be not less than three times the discharge area of the fans, should be provided at the side of the room opposite the fans at a height of about 10 feet above the floor level. Exceptionally, however, where the fresh air is supplied by a satisfactory plenum system, or direct from the erecting shop over a partition of sufficient height, screening the doping room from the rest of the shop, such air inlets may be unnecessary.

Owing to varying conditions of construction in different factories, it is impossible to standardize methods of ventilation for doping rooms, but in new works, or extension of existing plants, plans of proposed ventilating arrangements should be submitted to the inspector for dangerous trades, Home Office, before the work is put in hand.

At the commencement of the war, several cases occurred among persons employed in fabric making, erecting fittings, etc., before exhaust ventilation and separation of the process of doping from others was recognized as indispensable. These two conditions have now been secured for doping the wings, but recent experience has shown that insufficient attention has been paid in some factories to the necessity of exhaust ventilation in all processes in which tetrachlorethane dope is constantly used. This applies especially to taping—now sometimes found carried on in the general erecting shop without

¹ On the other hand, "dope poisoning," i. e., any illness attributable to the ingredients of the dope, has been added to the schedule of diseases to which section 8 of the Workmen's Compensation Act, 1906, applies.

any precautions—to which operation the three last fatal cases have been mainly due. Notwithstanding the comparatively small amount of dope used the close application required brings the face right into the fumes. And it is the same with the fuselage and other components—struts and landing gear. One attack was traced to the doping on one occasion of especially large wings in the general erecting shop because (it was alleged) the doping room proper could not accommodate them. There was a tendency in some premises before the great development of the industry was fully realized, to make the doping room too small. This should be avoided in future construction, but the risk involved by such a procedure as that described makes it incumbent on the occupier to improvise for any exceptional occasion a special exhaust system.

Pending the introduction of an efficient substitute for tetrachlorethane, it is most important that occupiers should (in addition to provision and maintenance of a high standard of exhaust ventilation) consider and apply as far as they can the following further suggestions for safeguarding the health of the workers, which are the outcome of experience gained in various works:

(1) *Exclusion of other work from the doping room.*—The need for this has already been pointed out on page 2.

(2) *Alternation of employment.*—Considerable periods of overtime or long spells in doping or taping have been noted as having preceded some of the fatal attacks. Obviously, as poisoning is a matter of dosage, and the effect of tetrachlorethane is cumulative, the object aimed at by ventilation is defeated if hours of workers are prolonged beyond that for which the ventilation has been designed. In factories where alternation of employment has been arranged, e. g., two days doping and two in other work, or one week in and one week out, improvement in health has resulted. And when such an arrangement is adopted occasional necessary overtime might, it is suggested, be undertaken by those on the out turn rather than by those who have already worked a full day in doping.

In addition to the alternation referred to, in one factory the women engaged in doping are made to spend half an hour morning and afternoon in the open air, so that no spell of work in contact with the fumes lasts longer than two hours.

(3) *Periodic medical examination.*—A fortnightly medical examination has served useful purpose, both in reassuring the workers and also in enabling those showing premonitory symptoms to be suspended or transferred to other work. The objective signs, however, which the surgeon has to guide him are few, and he can be materially assisted by information from the foreman or matron as to the state of health of the workers in the intervals between his examinations. After each visit the surgeon should state in writing the names of those (if any) whom he considers should be—

(a) Suspended as definitely suffering from dope poisoning necessitating absence from work until they are quite well, or

(b) Transferred temporarily to other work as a precautionary measure on account of equivocal signs.

Medical supervision on these lines has been adopted on their own initiative or on suggestion from the factory department in several aeroplane works, and the same course should be pressed in all where doping is continuous. It is important that it should be carried out by a medical practitioner who is familiar with the nature of the work and the symptoms to which it may give rise, preferably by the certifying surgeon, as he is in touch with the department and is thus kept informed of the latest observations on the subject. A health

register and instructions as to the conduct of the examination will be sent by the medical inspector to the medical man whom you appoint for the purpose as soon as notice of his name is received here.

A worker suffering from effects of dope should be excluded from all contact with it until he is quite well, a medical certificate to that effect being obtained. Instances are known in which premature resumption led to recurrence of symptoms in an aggravated form.

Instruction to workers.—Certain apparently small points have been noticed which have a bearing on liability to attack. Some instruction to new workers as to how they can best avoid inhalation of fumes without interfering with work is called for, especially bearing in mind the youthfulness of some of them.

(1) Doping should be commenced at the end of the wing nearest to the exhaust fans, and should proceed backwards from that point.

(2) In some factories the wings, as soon as the doped surface is "tacky," are carried to a drying room or closed chamber (separately ventilated) thus diminishing largely risk from inhalation of fumes. Where no such arrangement exists, the wings should be placed to dry in a position between the workers and the exhaust draft, but not so as to obstruct the fans.

(3) After doping, the safest position for the worker is that nearest to the fresh air inlets, but frequently men and women are seen standing close to the exhaust, and therefore breathing the air which is most highly charged with the noxious vapor; the reason being that either the flat top of the outlet duct has been found a convenient place to keep dope pots, brushes, etc., or the light is better there than at the far side. Short sightedness, unless corrected by glasses, should debar from taping if not from doping.

(4) Work should not be commenced on an empty stomach, and where tetrachlorethane is an ingredient of the dope a worker "must not be allowed to take a meal or to remain during the times allowed to him for meals in any room in which such substance is used." (Factory Act, 1901, S. 75.) Hence the need for provision of a properly equipped meal room on lines suggested by the health of munition workers' committee.¹

Even if, as is hoped, discovery of an efficient substitute enables use of tetrachlorethane to be eliminated from the dope, exhaust ventilation will still be necessary to prevent the effects (fortunately much less noxious) from such solvents and diluents as benzene, acetone, and methylated spirit, which must necessarily continue to be used.

SUMMARY.

In the manufacture of airplanes there is one process which may involve danger of occupational poisoning, the application to the fabric of a water-proofing, tightening mixture, known as dope. This is usually a cellulose compound, the nitrate or the acetate, dissolved in various volatile substances, which are more or less poisonous to human beings.

Cellulose acetate dope was formerly made with tetrachlorethane as the principal solvent. It is now made also without tetrachlorethane, dissolved in a mixture of acetone, alcohol, and benzol. Cellu-

¹Memorandum on Industrial Canteens, Cd. 8133, 1915, price 1d. See Bulletin of the U. S. Bureau of Labor Statistics No. 222, pp. 29-36.

lose nitrate dope is made with amyl acetate and acetone and usually various alcohols and benzol.

Dope poisoning which appeared in airplane factories in 1913 in Germany and England was caused by the presence of tetrachlorethane in the solvent. This poison is very like chloroform but four times as powerful. Acute poisoning causes drowsiness, confusion, dizziness, sometimes loss of consciousness, or nausea and vomiting and gastric pains. Repeated exposure to the fume causes more pronounced gastrointestinal symptoms and may set up an acute degeneration of the liver with jaundice. This condition, known as toxic jaundice, was the form of dope poisoning which occurred in airplane factories in Germany and Great Britain, and in several instances proved fatal. The British have in consequence recognized such dope poisoning as an occupational disease and have substituted for military and naval airplanes a dope free from tetrachlorethane.

The other solvents for cellulose acetate are acetone, alcohols (wood alcohol and grain alcohol), and benzol. These are all volatile and produce, when inhaled or when spilled on the skin, some disturbance of the central nervous system, but none has the effect on the liver and other organs which is exerted by tetrachlorethane. Benzol is the most poisonous and when inhaled in large quantities it may cause death, but in the proportion used in dope solvents such severe poisoning would not be looked for. The milder forms of acute poisoning would be more probable—dizziness, headache, slight symptoms of drunkenness, with excitement or depression, and, if exposure is long continued, symptoms of slow chronic poisoning with anemia, tendency to hemorrhages, and nervous and nutritional disturbances.

Acetone is the least dangerous of these solvents; indeed, there is no proof that acetone as used in industry is at all harmful. Methyl alcohol (or wood alcohol) may cause serious symptoms, even when present in small amount, for some people are very susceptible to it. The symptoms of chronic poisoning are much more serious than in chronic poisoning from grain alcohol, and may involve the eyes, causing permanent impairment or even loss of sight.

Cellulose nitrate dopes contain as solvents amyl acetate, acetone, or other ketones, various alcohols (ethyl, methyl, and amyl), and benzol. Amyl acetate has a disagreeable odor and an irritating action on eyes and throat, but so far as is known at present, it is not a dangerous poison. Amyl alcohol is said to be more rapid in its effects than grain alcohol and from four to seven times as poisonous.

In American airplane works the dopes used until very recently have been chiefly cellulose acetate dissolved in tetrachlorethane, or cellulose nitrate dissolved in amyl acetate and acetone. As cellulose

nitrate dope is inflammable and can not be used on war planes, and as tetrachlorethane is a dangerous poison, a third variety of dope has now come into use, which is made with cellulose acetate dissolved in a mixture of acetone, alcohol, and benzol. In the future it is probable that this dope will be used for war planes, while cellulose nitrate dope will continue to be used on airplanes being manufactured for training purposes.

There has been no serious dope poisoning in American airplane works as yet, and no authenticated case of tetrachlorethane poisoning resulting in toxic jaundice has ever been reported in this country. This is probably to be explained by the fact that though tetrachlorethane was used in our factories, the amount of dope used was usually small, doping was not continuous, and much of it was done in the open air. Moreover, dopers were continually shifting; not many remained more than a few months in the work.

The enormous increase in airplane manufacture in the United States is coincident with a gradual abandonment of tetrachlorethane as a dope solvent, so that we have no reason to expect that toxic jaundice will appear among the dopers in our factories. It is quite possible, however, that there may be more or less serious poisoning from benzol and from methyl alcohol, and it may prove that the other solvents used in nitrate and acetate dopes are not as harmless as we now think them. It is only prudent to assume that such danger is present and to provide carefully for the removal of fumes from doping rooms. The British requirements for artificial ventilation and for the medical supervision of dopers—requirements framed when tetrachlorethane was the solvent used—have remained in force now that the safer dopes have been substituted.

American airplane works are at present in process of building or remodeling. In many instances artificial ventilation is being installed; in others only natural ventilation is provided. There is little reason to expect serious poisoning among the users of dopes in these factories, but there will be opportunity for the slow, chronic effects of long-continued exposure to large quantities of amyl acetate and smaller quantities of benzol, wood alcohol, amyl alcohol, etc., among dopers, and this should be prevented by good exhaust ventilation. Doping should be strictly confined to one building. No other work should be carried on in the room. Dopers should be taught to avoid fumes by starting their work at the end nearest the exhaust vent and working back from there, for in this way the fumes will be continually drawn away from the air they breathe. Medical supervision, with periodic examination of the dopers, is

very desirable, since these poisons are comparatively unfamiliar and much valuable information as to their effects on industrial workers could be gained in this way.

In any factory where tetrachlorethane dopes are used the dopers should be protected not only by a good system of down-draft exhaust ventilation, but by shortening the hours of work, by alternation of doping with outdoor work, and by providing periodic medical examination, with authorization to the physician to suspend from work those who show premonitory symptoms of poisoning.

TRADE AGREEMENTS IN THE WOMEN'S CLOTHING INDUSTRIES OF CHICAGO.¹

BY BORIS EMMET, PH. D.

By reason of their geographical location, the Chicago women's garment industries never experienced the great superabundance of immigrant labor so characteristic of the New York garment trades in the days of unrestricted foreign immigration. This does not mean that Chicago garment manufacturers have ever felt any real shortage of workers. On the contrary, in spite of their great distance from the principal point of immigration, Chicago employers have always been able easily to secure workers, a fact evidenced by high peaks of seasonal employment² which are made possible only by the presence of a liberal supply of labor.

The cessation of immigration affected the Chicago garment industries less radically than it did similar industries in New York City. As yet no shortage of labor has been experienced. In connection with this latter statement, however, attention must be called to another difference in conditions between New York and Chicago, namely, the presence of a considerable amount of war work in New York City. To date relatively little of this war work requiring the services of needle-trade hands has found its way to Chicago.

The women's garment industries of Chicago, however, are gradually beginning to draw Government contracts. This fact tends to reveal to all concerned the effects of an almost total interruption of immigration. Those of the employers who, in addition to enjoying a normally busy season, have received or are about to receive Government contracts are beginning to wonder where the labor supply will come from when the busy spring season arrives. A similar state of mind exists among the officials of the women's garment workers' unions. Although many of their members are working only part

¹ This article is a preliminary summary of one of the phases of a study of trade agreements to be published by the bureau. Similar articles dealing with trade agreements in the women's clothing industries of New York and Philadelphia appeared in the issues of the MONTHLY REVIEW of December, 1917, and January, 1918, respectively.

² Cf. Bul. No. 183, U. S. Bureau of Labor Statistics, pp. 45-49.

time at present, the union offices receive daily inquiries regarding wages and hours from employers about to embark on Government work which will require the services of garment workers. There is no doubt that with the appearance of the busy spring season in these trades, and with increased numbers of orders for Government work which are bound to come, a real shortage of skilled labor will be experienced in the women's clothing industries of Chicago.

CLOAK AND SUIT INDUSTRY.

Sporadic attempts were made by the International Ladies' Garment Workers' Union to introduce collective bargaining into the cloak and suit industry in Chicago, but down to September, 1915, none of these attempts met with success. As a matter of fact, no really effective organization of the workers in the trade existed prior to the summer of 1915.

Early in the fall of 1915, after a threatened general strike, conferences were held between representatives of the union and representatives of the two cloak and suit manufacturers' associations. These conferences resulted in an agreement to submit all the differences to a board of arbitration, consisting of one representative of the union, one of the manufacturers' associations, and a third member agreeable to both sides. Such a board of arbitration was immediately organized, and as a result of hearings, at which both sides were represented by counsel, an award was made on September 24, 1915. This award became the trade agreement of the industry, to be in force from September 24, 1915, to July 1, 1917.

The basis of the 1915 award was stated by the board to be "the conditions prevailing at that time in the New York cloak and suit industry under the so-called protocol agreement." The board felt the necessity of creating "an approximate uniformity to conditions prevailing in other communities, and particularly in the city of New York." Certain differences between the Chicago and New York markets, however, had to be recognized. These were: (1) The difference in the nature of the business, the New York market being the predominating one—a market which more than any other was responsible in determining the conditions of manufacture and sale; (2) differences in the relations among the employers themselves, attributable to the fact that the New York manufacturers were better organized and more able to cope with questions arising out of the introduction of uniform labor conditions.

As finally formulated the agreement is between the joint board of Locals 18, 44, and 81 of the International Ladies' Garment Workers'

Union and two manufacturers' associations—the Chicago Cloak and Suit Manufacturers' Association and the Northwest Cloak and Suit Manufacturers' Association. The first-named association has a membership of 25 and employs from 1,500 to 1,800 workers; the second has a membership of 33 and employs between 800 and 900 people. The agreement provides for a 50-hour week, restricts overtime greatly, prohibits employers from operating their shops more than six days in any one week, and grants to the week workers seven legal holidays annually with pay. It specifies minimum weekly rates of wages for the week workers and minimum hourly rates for the pieceworkers. It obligates the employers to maintain safe and sanitary shops and prohibits home work and "team work" or inside contracting. Outside contracting is declared to be permissible, provided the standards of labor maintained by the contractors are equivalent to those specified in the agreement. Each employer is to maintain a preferential union shop—that is, a shop "in which the standards of the agreement are maintained and wherein preference in employment and lay-offs is given to members of the union." Employers retain the right of absolute discharge during the first two weeks of employment, but discharges occurring after the trial or two-week period are made subject to review by the duly constituted authorities for the adjustment of grievances.

The methods for the adjustment of grievances are as follows: Any complaint of either employer or employee is to be adjusted, in the first instance, by the union representative on the premises, called the shop chairman, and the employer. If these two can not agree, the controversy is submitted to an adjustment committee, consisting of a representative of the employers' association to which the employer concerned belongs and a representative of the union. Cases upon which the latter two can not agree are submitted for adjustment to a committee of three, one of which represents the employers, one the union, and the third member or umpire is chosen by mutual consent. In cases of inability to agree upon a third person, the latter is appointed by the board of arbitration created by the agreement. This board, consisting of three members, one representing the employers, one the union, and a third an impartial person, is given jurisdiction in all controversies arising under the agreement. It is also the court of final appeals. Decisions of the adjustment committee referred to above, if not satisfactory to either of the parties, may be appealed to it. All decisions of the board of arbitration are to be final.

The agreement prohibits the occurrence of strikes and lockouts and expressly states that all differences of opinion arising between

employer and employee are to be adjusted peaceably in the manner above indicated.

On July 1, 1917, the agreement was renewed by mutual consent for a period of one year. At the same time, certain demands of the workers upon which the parties themselves could reach no satisfactory settlement, were submitted to arbitration. The findings of the board of arbitration in this connection were announced on August 21, 1917, and were as follows:

FINDINGS OF THE BOARD OF ARBITRATION, AUGUST 21, 1917.

1. HOURS AND REGULATION OF WORK.

The regular working week shall consist of 49 hours; 9 hours on each of four week days, 8 hours on one week day, preferably Friday, and 5 hours on either Saturday or Sunday, dependent upon which of those days the employee observes.

Overtime shall be allowed only during the periods of from February 15 to May 15 and August 15 to November 15. It shall not exceed $12\frac{1}{2}$ hours per week, to be distributed at not to exceed $2\frac{1}{2}$ hours per day on week days and 4 hours on Saturday or Sunday, except that from August 15 to September 15 there shall be no overtime on Saturday or Sunday.

Overtime on sample work may be required during all the months of the year, instead of during the limited period above provided.

Whenever the Jewish New Year or Day of Atonement falls on a week day and a holiday is granted, then the preceding or following Saturday or Sunday, as may be determined by the employer, shall be considered as a full working-day and not as a half day.

Whenever overtime is allowed under the foregoing provision it shall be the duty of the employee to work such overtime, provided notice thereof be given on the preceding day.

Overtime for week workers shall be paid at the rate of one and one-half times the regular weekly wage.

If pieceworkers are required on any day to work more than one hour overtime, they shall be allowed 30 cents for supper money, whether they actually expend the same or not.

2. WAGES.

[The changes in wage rates are shown in footnote on p. 70.]

3. SANITARY CONDITIONS.

The matter of enforcing the use of air irons is reserved for further consideration.

4. RELATIONS BETWEEN EMPLOYERS AND EMPLOYEES.

The following additional provisions are made:

Each employer shall promptly notify the business agent of the union of the names and addresses of all contractors, subcontractors, and subsidiary shops with whom he is in any manner dealing, and of persons to whom raw material is given or sold, or who are purchasing such material wholly or partly upon

the credit or responsibility of such employer, for the purpose of manufacturing or of selling the finished product to the employer. The board of arbitration, however, reserves the right to amend or change this requirement, and further or otherwise to regulate the relations between, and the obligations of, the employer, for the contractor, subcontractor, subsidiary shop, and also persons from whom the employer purchases made-up garments.

If after notice from the union that the subcontractor fails to observe the standards, the employer fails at once to withdraw the work then in the hands of the subcontractor, and on complaint the charge of failure to observe the standards is upheld, the employer shall pay to the union for all work done in such shop after such notice on the scale fixed by this agreement.

A reorganization in good faith shall be taken to mean a bona fide reorganization of the employer's business, necessitated by the permanent curtailment of his business, or a fundamental change in the character of the business.

A reorganization shall not be effected, however, unless 30 days' notice of the intention to reorganize shall be given to the business agent of the union.

5. PENALTIES.

The board of arbitration reserves the right to make award as to penalties to be enforced against either side, or the member thereof, for violation of the agreement.

6. EXCEPT AS TO WAGES, THE FOREGOING MODIFICATIONS SHALL BE EFFECTIVE AS OF AUGUST 19, 1917.

AS TO WAGES OF WEEK WORKERS.

Any week worker who from and after July 1, 1917, shall have received less than the minimum fixed by this modification, shall receive the difference between the amount received and such minimum for such back period.

AS TO PIECEWORKERS.

It is the intention that the increases hereby granted shall be retroactive as of July 1, 1917. It has been represented, however, that through error or agreement in some instances, the garment price has been calculated on a basis in excess of that fixed by the original award, and that perhaps in some instances it has been calculated on a lower basis. The price adjuster shall, in the first instance, determine whether any such miscalculations have been made, and if on such determination it is found that the workers have been paid less than they would have been entitled to under the new basis, they shall be paid an additional sum, based on the difference between the old and the new scale. If, however, it is found that they have already received pay based on the new basis, or in excess thereof, then no back pay shall be paid in such instance. The determination shall be made as to each garment on which complaint of underpayment on the new basis is made.

An examination of the findings shows that the principal changes introduced by the decision of the board of arbitration of August 21, 1917, were a reduction in the hours of labor; increases in the weekly

and hourly rates of wages¹; registration of contractors with the union in order to enable union officials to determine if agreement standards are maintained in the contractors' shops.

Collective bargaining in the Chicago cloak and suit industry is not confined to establishments of the members of the two manufacturers' associations mentioned. In addition to the trade agreement with the latter, the union has at the present time, about 50 oral agreements with as many individual establishments. These employ about 1,000 workers. The terms of these agreements are practically the same as those of the agreement with the two employers' associations.

The representatives of the employees concerned are unanimous in their approval of the existing methods of collective bargaining. With a few exceptions, the members of both the employers' associations are heartily in favor of the existing trade agreement "as the best possible method for dealing with the employees" and as "the only method to standardize labor costs in the industry." When discussing the value of the agreement employers generally refer to the highly unsatisfactory conditions which existed in the industry prior to the introduction of collective bargaining. They emphasize the fact that the industry is highly seasonal and extremely competitive. A stoppage of work during the busy season may, they say, easily

¹ The following table shows the weekly and hourly rates of wages prior to and after the decision of August 21, 1917:

Weekly and hourly rates of wages prior to, and after, the decision of Aug. 21, 1917.

result "in ruining the business of the entire season," because a failure to deliver the goods on time means "a customer lost forever." The present system protects the employer from disastrous stoppages during busy seasons, not only because such stoppages are prohibited by the agreement, but because definite channels are provided through which the employees are certain to secure an impartial adjudication of their grievances.

In discussing the present workings of the trade agreements in the Chicago cloak and suit industry mention should be made of the methods used for the adjustment of piece-rate controversies which occur almost daily in every shop, and which in the past have been the most fruitful source of strained relations between employee and employer, having resulted frequently in lockouts and strikes.

The agreement specifies that all rates to be paid to pieceworkers shall be agreed upon in advance by individual employers in consultation with, and with the approval of, a committee of their employees, and shall be adjusted as nearly as possible on the minimum basis specified by the agreement for "each hour of continuous work by a worker of average skill." It is the duty of the employer and the price committee of his employees to endeavor to agree upon the piece rates to be paid. In case of disagreement the matter is referred to two officials, one representing the manufacturers' associations and the other the unions. If neither the employer and his employees nor the officials last mentioned are able to reach an agreement, the dispute is then referred to an impartial price adjuster, who is selected and paid jointly by the two employers' associations and the unions. In his work of adjustment he is assisted by officials representing the two parties, but is not obliged to be guided by their opinion. He is expected to render an independent judgment which is final and obligatory on both parties. The agreement provides that disputes regarding piece rates are not to result in a cessation of work on the garment in question. If the service of the impartial adjuster can not be obtained immediately it is the custom for the employer and the price committee representing his employees to agree upon a low flat rate per garment, subject to back pay on the basis of the final rate determined by the adjuster.

The decisions of the impartial adjuster are made informally, on the premises of the establishment in which the controversy occurs, and in the presence of the officials of both parties, the last named acting, as already stated, in an advisory capacity only. A record of each adjustment is made, showing the number of style and the piece rate arrived at by the adjuster.

It is the usual practice of the impartial price adjuster to set four separate rates on each style of garment, to wit, for the operating,

for the finishing, for the under pressing, and for the off or final pressing. The finishing and pressing operations do not vary greatly with the changes in styles and are seldom the cause of serious piece-rate controversies. Only occasionally are the services of the impartial price adjuster required to establish piece rates for finishing or pressing. Where the employer and his price committee of employees are unable to agree such rates are usually set by the two officials representing the employer and the unions. The most serious controversies regarding piece rates occur in connection with the operating processes, for the reason that changes in styles affect the amount of labor involved in the operating far more than they affect the amount involved in finishing and pressing.

No time studies to determine the actual amount of labor involved in specific operations are ever made. As a matter of fact, however, specific time allowances, acquiesced in by both parties and utilized by the impartial adjuster in the determination of piece rates, do exist, although not committed to writing. Rates based upon established and mutually satisfactory time allowances exist for all of the basic operations on cloaks and suits, such as the making of plain bodies, ordinary collars, sleeves, belts, buttonholes, sewing on plain trimmings, pockets, etc. Basic standard piece rates, definitely acquiesced in by both parties, exist also for all the finishing and pressing operations. All these are in force from season to season and vary only with the so-called "qualitative" character of the establishment. The establishments under the agreement are unofficially classified, according to the general quality of their merchandise, into "cheap," "medium," "good," and "high grade" shops; the higher the quality of the shop the higher the piece rate set for the same basic operation. This qualitative classification of shops has been in operation in the trade so long that controversies regarding it seldom arise.

In setting a new rate each specific new feature is carefully and separately examined and a time allowance on it established. The method of appraising each minor feature separately has, it was said, a tendency to counterbalance errors made; an overestimate in the time allowance on one may easily be compensated by an underestimate on another. The amount of time required to make the standardized parts of the garment, known in advance, is supplemented by an estimate of the aggregate time required to make all the features. The sum total of time thus arrived at is multiplied by the hourly rate specified in the agreement, and the result constitutes the final piece rate set by the adjuster.

It was declared repeatedly by persons concerned in these adjustments that the personality of the adjuster determines to a great ex-

tent the confidence of the persons affected in the fairness of his decisions, and thus ultimately the success or failure of the entire system of piece-rate making. During the first six months of the application of the system not less than five adjusters were found unsatisfactory and were discharged. Besides enjoying the confidence of employer and employee, the adjuster, it is said, must be an expert at the trade and possess considerable tact and diplomatic ability, as arbitrary methods in the handling of such matters are extremely undesirable and are to be used only as a last resort.

The trade expertness of the present adjuster enables him to arrive at his decisions independently, and there is therefore no tendency on his part "to split the difference" as is sometimes done by industrial arbitrators. This fact is repeatedly referred to by employers and employees as being responsible for their confidence in the fairness of his adjustments. It is stated that the piece rates set by him, although based upon estimates, usually enable the workers to earn easily the hourly rates specified in the agreement without compelling the manufacturer to cease the production of the garment because the labor cost set upon it by the impartial adjuster would make its manufacture unprofitable.

Although the rates set by the impartial adjuster are objected to from time to time by one of the parties, the number of such instances on record is small. Generally speaking, it may be stated that thus far no great difficulties have been experienced by the respective organizations in making the parties to the controversies comply with his decisions. The confidence of the employees in the fairness of the scheme is greatly augmented by the fact that the decisions of the impartial adjuster are final. The finality of the adjudication makes it impossible for the controversy to "drag on too long."

DRESS AND WAIST INDUSTRY.¹

A general strike, which lasted for about 10 weeks, took place in the dress and waist industry in Chicago in 1916. The strike was carried on under the auspices of the International Ladies' Garment Workers' Union, because the workers of the trade were organized in 1915 as its Local No. 100.

At the time of the declaration of the strike, the union presented the following demands: (a) A 48-hour week; (b) 6 working days per week; (c) restriction of overtime; (d) 7 legal holidays annually with pay to week workers; (e) equal distribution of work during

¹ Unlike the dress and waist industry of New York City, which is highly specialized and confined exclusively to the manufacture of dresses and waists, the Chicago dress and waist industry manufactures also house dresses, kimono's, and white goods. It is estimated that the industry at the present time employs about 7,000 workers.

dull seasons; (*f*) minimum weekly and hourly rates of wages;¹ (*g*) safe and sanitary workshops; (*h*) union recognition and the application of the preferential union shop; (*i*) the presence in each establishment of a representative of the union elected by the workers; (*j*) election by the workers in each establishment of a piece-rate committee to settle piece prices with the employer; (*k*) prohibition of strikes and lockouts; (*l*) peaceful adjustment of grievances by a committee on adjustment to consist of three members, one representing the workers, one the employer, and an umpire selected by mutual consent; (*m*) the maintenance by contractors employed by members of the employers' association of labor standards equivalent to those demanded of the employers themselves.

While the strike was in progress the union modified some of its demands, particularly those referring to minimum rates for week workers. The original demands were in most instances reduced by \$1 and, for some occupations, by \$1.50 per week.

At the beginning of the strike as well as while it was in progress the workers were ready and willing to submit their demands to arbitration. The employers, however, flatly refused to have any dealings with the union. Efforts made by local public authorities, as well as by a representative of the conciliation division of the Federal Department of Labor, were without avail. The employers applied to local courts for the issuance of injunctions to restrain the union from picketing and from paying strike benefits. Four injunctions were thus obtained. These resulted in wholesale arrests of picketers and members of the union and finally broke the resistance of the workers.

¹The following table shows the rates of wages demanded:

Occupation.	Weekly rates demanded in—	
	Waist, dress, and skirt industry.	Kimonos and white goods industry.
Cutters:		
Full fledged.....	\$27.50	\$22.00
4 years' experience.....	25.00	(a)
3 years' experience.....	22.50	20.00
2 years' experience.....	20.00	17.00
1 year's experience.....	17.00	15.00
Pressers.....	23.00	(b)
Sample makers.....	16.00	(b)
Examiners.....	13.00	(b)
Finishers.....	12.00	(b)
Cleaners.....	9.00	(b)
Operators.....	c. 40	c. 35

a No rate.

b 20 per cent increase.

c Per hour.

The union has at the present time no trade agreement with the organized manufacturers of the dress and waist trade of Chicago. It has, however, 42 trade agreements with as many establishments, the owners of which do not belong to any employers' association. The 42 establishments in question employ about 800 workers, and are distributed as follows: Dresses and skirts, 31 shops; kimono and house dresses, 8 shops; waists, 3 shops. The terms of the agreements with the individual establishments are essentially the same as those demanded by the union from the organized employers.

WATERPROOF-GARMENT INDUSTRY.

This industry employs about 600 workers. The raincoat makers, who constitute the principal group of workers in the trade, are organized as local 54, of the International Ladies' Garment Workers' Union. This local has, at the present time, six trade agreements with as many employers, employing in the aggregate about 200 workers.

The trade agreements are in writing. Each is to run for one year from the date of signing, and provides for the following: (1) Employment of none but members of the union; in cases of inability of the union to supply the needed help, employers are permitted to hire nonunion workers, provided the latter are willing to join the organization; (2) 49-hour week; (3) restriction of overtime; (4) time and one-half for overtime, and double time for Sunday work; (5) five legal holidays annually, with pay; (6) except during the first eight days of employment, no workers are to be discharged without sufficient cause, said cause to be communicated to the union office; (7) business agent of the union to have free entrance into employers' shops at any time on legitimate business; (8) specific minimum rates of wages; (9) equal division of work during dull seasons; (10) safe and sanitary workshops in accordance with the State laws; (11) nonemployment of workers under the age of 16; (12) prohibition of strikes and lockouts; (13) peaceful adjustment of all differences by a committee of two representing the union and the employer, and in instances of failure to agree, by a third and impartial person satisfactory to both sides.

The six agreements cover slightly over one-third of the waterproof-garment workers of Chicago, the remaining two-thirds being employed in one establishment, which is, at the present time, manufacturing military raincoats. This establishment is employing nonunion help, mostly girls, and does not maintain union conditions of labor. As a matter of fact, by the introduction of an elaborate sub-

division of labor, it has done away altogether with the services of skilled raincoat makers.

The fact that the latter establishment—the largest and the leading one of the trade—is securing relatively lower labor costs by the employment of nonunion help constitutes, in the opinion of the union officials, a perpetual menace to the existence of the raincoat-makers organization. Some of the employers, who at the present time are dealing collectively with the union, have informed the latter that unless the greater portion of the trade is unionized and labor rates throughout the industry are equalized, they will not in the future be in a position to renew the existing agreements.

LABOR AND THE WAR.

UNIFORMITY IN FEDERAL LABOR POLICY.

In order that labor policies may be made uniform all agencies for the provision, distribution, housing, and otherwise caring for workmen in war industries have been centered in the Department of Labor and the Secretary of Labor made in effect the labor administrator of the Government. This program of war-labor administration has been formulated as a result of conferences between the Department of Labor and the Council of National Defense, and has the approval of the President.

Among the agencies which are already in existence within the Department of Labor for carrying out the work are the following: (1) System of labor exchanges; (2) machinery for the adjustment of labor disputes; and (3) investigating bodies, as, for example, the Bureau of Labor Statistics. New agencies will be provided (1) for the training of workers; (2) for determining priority of labor demands; (3) for dealing with the dilution of skilled labor; (4) for securing proper conditions of labor; (5) for safeguarding living conditions, including housing and transportation; and (6) for purposes of publicity.

Supplementing these agencies the Secretary of Labor, as proposed, has called to his assistance an advisory labor council, i. e., a corps of advisers and administrators representing capital, labor, and the public.

The members of the advisory council have been appointed by the Secretary. Representing the public are ex-Gov. John Lind, of Minnesota, and Prof. L. C. Marshall, of the University of Chicago; representing employing interests are Mr. Waddill Catchings, of New York and Alabama, president of the Sloss-Sheffield Steel & Iron Co., and Mr. A. A. Landon, of Buffalo, N. Y., general manager American Radiator Co.; and representing labor are Mr. John B. Lennon, ex-president of the International Tailors' Federation, and Mr. John J. Casey, former United States Representative from Pennsylvania. Miss Agnes Nestor, president of the Chicago Women's Trade-Union League, represents the interests of women workers.

Unity of action between the departments of the Government in labor matters is assured by the intention of the Secretary to increase

the membership of the council by the appointment of representatives from the War and Navy Departments and from the Shipping Board.

STATEMENT BY THE COUNCIL OF NATIONAL DEFENSE.

The statement issued by the Council of National Defense is as follows:

As a result of a series of conferences on the subject of labor policies, the Council of National Defense submitted to the President a program for war-labor administration. This program has been approved by the President and he has, accordingly, requested the Secretary of Labor to undertake this administration and to provide for this purpose the following agencies:

1. A means of furnishing an adequate and stable supply of labor to war industries. This will include:

- (a) A satisfactory system of labor exchanges.
- (b) A satisfactory method and administration of training of workers.
- (c) An agency for determining priorities of labor demand.
- (d) Agencies for dilution of skilled labor as and when needed.

2. Machinery which will provide for the immediate and equitable adjustment of disputes in accordance with principles to be agreed upon between labor and capital and without stoppage of work. Such machinery would deal with demands concerning wages, hours, shop conditions, etc.

3. Machinery for safeguarding conditions of labor in the production of war essentials. This is to include industrial hygiene, safety, women and child labor, etc.

4. Machinery for safeguarding conditions of living, including housing, transportation, etc.

5. Fact-gathering body to assemble and present data, collected through various existing governmental agencies or by independent research, to furnish the information necessary for effective executive action.

6. Information and education division which has the functions of developing sound public sentiment, securing an exchange of information between departments of labor administration, and promotion in industrial plants of local machinery helpful in carrying out the national labor program.

Some of these agencies already exist in part in the Department of Labor. For example, the mediation service, the system of labor exchanges, and the Bureau of Labor Statistics can be utilized to the extent they are found useful in carrying out the new program.

It is the purpose of the Secretary of Labor to undertake the work outlined above on an adequate scale. He will call to his assistance as advisers and administrators a well-balanced corps of men of high standing, representing capital, labor, and the public. These persons will assist him in formulating and efficiently executing policies which will command the approval and support of employers, employees, and the public throughout the United States. The Secretary and his advisers will give early attention to the question whether congressional action shall be requested.

The Secretary of Labor will bring this new service into touch with the needs of the various departments of Government, including the Shipping Board, in order that labor policies may be made uniform and that the service thus established under the President's order shall adequately meet the needs of the present emergency.

PROGRAM OF THE ADVISORY COUNCIL APPROVED BY THE SECRETARY OF LABOR.

On January 16 announcement was made of the appointment of the advisory council. The council at once began sessions, and on January 28 its program of labor administration was approved by the Secretary of Labor. This program may be outlined as follows:

AGENCIES OF ADMINISTRATION.

A broad outline of the administration of the new work provides for the organization of six new agencies or services within the Department of Labor, in addition to the three industrial-service agencies which are already in existence and ready to function for the purposes in hand. The six supplementary services or agencies to be created, in addition to the conciliation service, the United States Employment Service, and the investigating bureaus of the department, are the following:

1. A Conditions of Labor Service to administer conditions of labor within business plants, such as safety, sanitation, etc.
2. An Information and Education Service to promote sound sentiment and to provide appropriate local machinery and policies in individual plants.
3. A Woman in Industry Service to correlate the activities of various agencies dealing with this matter.
4. A Training and Dilution Service.
5. A Service of Housing and Transportation of Workers.
6. A Service of Personnel (which may possibly be fused with the Information and Education Service.)

The scheme of organization accepts the continuance of such agencies as the industrial-service sections of the Bureau of Ordnance, the Shipping Board, the Quartermaster Corps in the War Department, and of such other departmental bureaus as may have set up satisfactory industrial-service sections as a part of their own organization. The facilities of these bureaus will be utilized, but their activities will be centralized and cleared through the appropriate controlling sections of the Department of Labor.

PLAN OF ORGANIZATION.

The administration is centralized under the Secretary of Labor. The Secretary will be assisted by his "policies board," made up of his advisory council, the heads of the industrial service sections of other governmental departments or bureaus, and the heads of the existing bureaus of his own department.

The industrial service sections of the other governmental departments or bureaus are to be organized on the same general scheme that governs the organization of the new service sections established within the Department of Labor. The chiefs of the various subsections of the industrial service sections of the other governmental departments will clear their activities through the head of the appropriate service established in the Department of Labor.

The general plan of utilizing the functions of the different industrial service sections in other governmental departments which are now in existence or will be created has back of it certain fundamental reasons:

- A. It will be possible to get under way with the new administration much more rapidly if existing agencies are utilized than it will be if they are

supplanted. Promptness in getting under way is desirable both as a means of deserving the confidence of other departments of Government and as a means of facilitating the successful conduct of the war.

- B. The departments of Government which have set up or which may set up industrial service sections have entered into contracts with various firms. In many cases these contracts are so drawn as to give these departments a very considerable control of the conduct of the plants. This is particularly significant in the case of labor matters. More efficient action in dealing with these firms on labor matters can, of course, be secured by the contracting department than by some other department.
- C. These industrial-service sections are rapidly acquiring an efficient personnel. It is not too much to say that they are combing the country for the best men in certain lines. It will be much easier to retain this personnel in the existing organization than it will be to transfer it to another, and the personnel problem is a very serious one in labor administration.
- D. Quite aside from their industrial-service sections, as such, these other departments have in their inspection forces a large personnel which can be used, and, indeed, is being used, in labor administration. For example, in the Ordnance Department their inspectors make daily or semiweekly or weekly reports concerning conditions of living, conditions of labor, labor turnover, etc. These inspection staffs could not be used to as good advantage if the administration of labor were divorced from the administration of production.
- E. The system of control charts established by such bureaus as Ordnance furnishes accurate data on which administrative action may be taken, in that these charts make possible the determination of the precise character of difficulties which arise in industrial plants. It is not too much to say that very heavy expenditures by an agency outside of these production departments could not secure as accurate information concerning conditions as can be secured in ordinary administrative routine within the production department itself. This is only another way of emphasizing the fact that we must think not in vague terms of "labor," but in terms of "labor in production."
- F. The plan proposed accords with generally approved theories of business administration. It secures the necessary *centralization of control* together with the wise *decentralization of administration* by agencies which come into direct touch with the problem at issue.
- G. The plan in no way limits the freedom of the Department of Labor to set up such supplementary agencies as may be necessary. There will accordingly result a well-rounded administration and not a piecemeal administration.
- H. The plan definitely locates responsibility and power of decision. These rest with the Secretary of Labor. The various activities of the industrial service sections of other departments are cleared through the bureau heads of the Department of Labor.
- I. The plan is flexible in character. If, as time goes on, it should appear that these sections should lose their identity and thus become *merged* in an administration under the Department of Labor, there is nothing to prevent such action being taken. On the contrary, fusion would have been facilitated by a period of teamwork.

IMPORTANCE OF THE NEW WORK.

The advisory council states that a perfect administration of labor matters in accord with the plan outlined above is not sufficient to meet the emergency which faces the country, and continues:

"Labor matters do not stand by themselves. They are phases of production, and no centralized administration of labor can be adequate which does not go hand in hand with the centralization of administration of production, and failure to secure such centralization spells failure to secure a sound situation in labor, and failure to prosecute the war vigorously."

FARM-LABOR SPECIALISTS TO AID FARMERS IN SECURING HELP.¹

To cooperate effectively in the farm-labor problem with the United States Department of Labor, State councils of defense, State commissioners of agriculture and labor, and other official State and local agencies concerned with supplying needed farm labor, the Department of Agriculture has divided the country into four farm-labor divisions: (1) New England and Northeastern States, (2) Southern States, (3) North Central States, and (4) Western States.

Each of these divisions is in charge of a representative of the Department of Agriculture, known as a supervising farm-help specialist, who supervises the work of the department's farm-help specialists assigned to the farm-labor work in single States or two or more adjoining States. These farm-help specialists will cooperate directly with State agencies, central and local employment agencies of the United States Department of Labor, and with the county agents and community farm-help committees.

The farm-help specialists through preliminary labor surveys will endeavor to ascertain the prospective needs for extra labor in each community. They will work with State and local agencies to supply labor deficiencies from local supplies, if possible, or from the nearest point where labor can be secured. All local sources of labor first will be drawn upon. In cases of necessity, however, arrangements will be made, through the Department of Agriculture and the Department of Labor, for interstate movement of help.

It is pointed out that the farmer in need of labor should proceed as follows: He should report his need to his county agent or to a member of the community farm-help committee. If possible, his need will be supplied from lists of men available in the county. If local labor is inadequate, the county agent or committee will report to the State farm-labor specialist, who, in cooperation with the State officials, will draw on the nearest available labor within the State.

The plan contemplates appointing a State farm-help specialist for each of the large agricultural States.

¹ From Official Bulletin for January 10, 1918.

HOURS OF LABOR IN RELATION TO OUTPUT IN BRITISH MUNITION FACTORIES.¹

In Memorandum No. 20 on "Weekly hours of employment," issued under date of October, 1917, by the health of munition workers committee of the British ministry of munitions, it is urged "that the time is now ripe for a further substantial reduction in the hours of work." In view of the importance of this subject in connection with labor conditions in the United States, the text of this memorandum is given herewith in full.

WEEKLY HOURS OF EMPLOYMENT.

MEMORANDUM No. 20.

1. The committee have had under consideration the recommendations made in regard to the maximum weekly hours of employment of men, women, and young persons, which were set out in their Memorandum No. 5 on "Hours of work" (issued January, 1916). When the committee commenced their labors, two years ago, they were faced with an almost complete absence of any scientific data as to the relation of hours of employment to output. They had accordingly to rely upon the general evidence of employers, workers, and other persons of experience. As explained in Memorandum No. 1 on "Sunday labor," this evidence was practically unanimous as to the need for a weekly period of rest. There was, however, revealed a marked divergence of opinion as to the limits within which weekly hours of employment should be kept. It was a matter of urgent importance that some guidance on this subject should be offered forthwith. On the other hand, it was clear that in the absence of exact and reliable data any recommendations put forward at that time must necessarily be tentative and provisional in character. Moreover, if they were to be of practical value and to secure any wide measure of acceptance it was necessary that they should satisfy two essential conditions. First, they had to be such as would be regarded as reasonable and moderate by the great mass of employers and workers, and in the second place, while taking account of the probable duration of the war, they had to have regard to the immediate urgency of output at the time. Any recommendations which might involve even a temporary diminution of output would have been doomed to failure. It was evident, in fact, that any reduction of hours proposed must be gradual, and the committee accordingly based their recommendations on what appeared

¹ Health of munition workers committee, ministry of munitions. Memorandum No. 20. Supplementary to Memorandum No. 5 (hours of work). Weekly hours of employment, October, 1917 [Cd. 8801]. 7 pp. Price, 1d. net.

Of the previous memoranda on the subject of hours of labor and output, the following are reproduced in Bulletin 221 of this bureau: Memorandum No. 1, Sunday labor; Memorandum No. 5, Hours of work; Memorandum No. 12, Statistical information concerning output in relation to hours of work (report by H. M. Vernon, M. D.). In Bulletin 230 are reprinted portions of an interim report (February, 1917) of the Health of Munition Workers Committee, which relate to "The comparative efficiencies of daywork and night work in munition factories" and "The causes and conditions of lost time," the latter by Thomas Loveday, M. A. A summary of Memorandum No. 18, "Further statistical information concerning output in relation to hours of work, with special reference to the influence of Sunday labor," is given in the MONTHLY REVIEW for November, 1917, pp. 61 and 62.

to be immediately practicable rather than on what was ultimately desirable or might be defensible on a physiological basis. Further, they found it necessary to confine themselves to suggestions as to the maximum limits within which employment should be restricted, and they did not endeavor to set out the extent to which, in their opinion, it was necessary or desirable to reduce these limits to meet varying industrial conditions.

2. The committee are of opinion that their cautious action and advice has been justified by events, and they are glad to take the present opportunity of recognizing the sympathy with which their recommendations were received, as well as the active and continuous efforts which have been made by the departments concerned to secure their general adoption. The limits of the weekly hours of employment then suggested were—

(a) For men, that the average weekly hours of employment should not exceed 65-67 (exclusive of meal times), i. e., a 13-14-hour working day.

(b) That boys under 18 should be allowed to work the same hours as men, provided that—

(1) The hours of boys under 16 should be limited to 60, so far as possible.

(2) Substantial relief at the week ends should be insisted on.

(3) Night work should be limited, as far as possible, to boys over 16.

(c) That for women and girls employment should be restricted within the normal legal limit of 60, i. e., a 12-hour working day, though within these limits moderate daily overtime might be allowed, and that the employment of girls under 18 at night should be limited as far as possible.

3. The committee are of opinion that the time has now come when these recommendations may properly be reviewed in the light of the following facts: First, the experience gained and the new evidence collected during the past two years; secondly, the strain involved by three years of war conditions, a strain which is likely still to continue for a considerable period; and, thirdly, the rapid increase in the number of women workers and in the variety of processes on which they are employed.

4. From the commencement of their work the committee have attached the highest importance to the collection of exact data affecting the problems at issue. The field to be covered is a very wide one, while the process of collection is slow and laborious. The committee, however, consider that the data which have already been collected on their behalf by Dr. Vernon and others are of great practical value and merit the most serious attention. The results of these investigations are the more valuable in that they have been undertaken solely in a spirit of scientific investigation and with no preconceived opinions. The selection of factories for inquiry was based solely on the likelihood of reliable data being forthcoming. Further, in none of the operations studied was there any change in the nature of the operation or the type of machinery during the period under review. The data were so chosen as to eliminate any possible disturbance due to increasing skill. There is no reason to suppose that the data quoted below were vitiated by any artificial restriction of output.

5. The results of Dr. Vernon's investigations, which covered a period of over a year, are set out in memorandum No. 18. Although that memorandum has already been submitted to the ministry and published, it appears desirable shortly to set out again the principal results of his investigations in so far as they concern the relation of weekly hours of employment to output. The following are the four sets of data which bear on this subject:

(A) WOMEN TURNING ALUMINIUM FUSE BODIES.

	Average weekly hours.		Relative hourly output.	Relative total output.
	Nominal.	Actual.		
First period.....	74.8	66.2	100	100
Second period.....	61.5	54.8	134	111
Third period.....	54.8	45.6	158	109

During the first period Sunday work (eight hours) was done on five out of six Sundays; during the second on three out of eight, the nominal weekly hours in these three weeks being 66.5 instead of 58.5, an average of 61.5; during the third period the timekeeping was bad, the normal weekly hours of work averaging about 55. Dr. Vernon accordingly suggests that with good time-keeping a nominal 50-hour week ought to yield the same actual hours of work (namely, 45.6); that is to say, that for women engaged in moderately heavy lathe work a 50-hour week yields as good an output as a 66-hour week and a considerably better one than a 75-hour week.

(B) WOMEN MILLING A SCREW THREAD.

	Average weekly hours.		Relative hourly output.	Relative total output.
	Nominal.	Actual.		
First period.....	71.8	64.9	100	100
Second period.....	64.6	54.8	121	102
Third period.....	57.3	48.1	133	99

Dr. Vernon explains that the reason why a reduction of hours did not lead to an improvement of total output similar to that in the fuse-body turning operation is that for four-fifths of the total time required to mill the screw thread on the fuse body the operative had no opportunity of quickening her working speed, since she had merely to stand idly watching her machine, whereas the lathe worker had to apply seven different cutting and boring tools in succession to each fuze body, and could quicken up her speed of work at almost every stage.

(C) MEN ENGAGED IN HEAVY WORK.

	Average weekly hours.		Relative hourly output.	Relative total output.
	Nominal.	Actual.		
First period.....	66.7	58.2	100	100
Second period.....	62.8	50.5	122	106
Third period.....	56.5	51.2	139	122

It should be noted that during the third period the nominal weekly hours were about 5-6 less than during the second period. Owing to the cessation of Sunday labor the timekeeping was so much improved that the actual hours of work were greater than during the previous period.

31 : 17

(E) BOYS BORING TOP CAPS.

	Average weekly hours.		Relative hourly output.	Relative total output.
	Nominal.	Actual.		
First period.....	78.5	72.5	100	100
Second period.....	61.5	54.7	117	88
Third period.....	60.5	54.5	129	97

Increase of output in this process, which is largely automatic, could only be attained by a more continuous feeding of the machines throughout working hours.

6. The above data show that a reduction in the weekly hours of actual work, varying from 7 to 20, in no case resulted in more than an insignificant diminution of total output, while on the average it produced a substantial increase. As Dr. Vernon points out, the classification of the operations according to the possibility they offer for speeding-up production demonstrates anew the self-evident fact that the alterations of hours may have very different effects in different operations. The exact measure of such alterations can not be predicted; it can only be ascertained by observation and experiment. It appears evident, however, that for processes similar to those examined by Dr. Vernon, the weekly hours can advantageously be reduced to a total of from 50 to 55, and he suggests that even lower limits might give an equally good output.

7. Two further points of importance emerge from consideration of these data. In the first place, the rate of production changed gradually, and frequently four months elapsed before an equilibrium value was reached. This gradual change appears to nullify the suggestion that the effect upon output of the change of hours was a mere consequence of the desire to earn the same weekly wages as before the hours were shortened. The explanation is rather to be traced to the worker finding unconsciously and gradually by experience that he can work more strenuously and quickly for a short-hour week than for a long-hour week. In the second place, the evidence suggests that a considerable increase in the average hourly output is possible, quite apart from any increased rapidity of working. Thus, as the result of special investigations, Dr. Vernon found that in the case of the first body of workers mentioned above the time lost in commencing and stopping work during the first period averaged 37 minutes as compared with only 26½ minutes during the third period.

8. Prof. Loveday, in his memorandum on the "Causes and conditions of lost time," which is included in the committee's interim report on "Industrial efficiency and fatigue,"¹ also supplies valuable data of a somewhat similar character. In the first place, he points out that the proportion of lost time that is due to sickness and other unavoidable causes is, as a rule, greatly underestimated in factory records and the proportion due to slackness consequently overestimated. In the second place, he expresses the view that long hours, much overtime, and especially Sunday labor exert a pernicious effect upon health, particularly of persons occupied in heavy trades. In paragraph 33 (5) of that memorandum he gives two tables, the first dealing with a body of about 180 men and the second with between 300 and 400 men employed on heavy work, their normal hours being from 65 to 70. In both these cases, when comparison is made with the figures of lost time for June, 1915, and for a year later, the fact emerges that there was a material increase in the amount of lost time and

¹ Cd. 8511.

that by far the larger portion of the increase was due to recorded sickness. In both cases throughout recorded sickness represented a noticeably high proportion of the total amount of time lost.

9. Prof. Loveday also devoted considerable space to the examination of figures concerning the amount of time lost before breakfast. He concludes:

(a) That if early hours be worked, the loss is likely to decrease if the start be later than 6 a. m.

(b) That when the total hours of the day-shift week are the same, there are likely to be more hours actually worked without than with work before breakfast, other conditions being similar.

(c) That a reduction of hours may be compensated for or even outweighed by the abolition of early hours, partly owing to reduced absences, partly owing to reduced waste of time, and partly to the greater vigor of work after taking food.

He quotes figures for a number of different factors which confirm these conclusions. He strongly presses the view that food should precede work. He points out the undesirability of hunger work, its bad effect upon health, and the temptation to lose time in the short early spells.

10. There can be little doubt that there is an increasing recognition on the part of both employers and workers of the broad fact which emerges from the investigations of Dr. Vernon and Prof. Loveday, namely, that substantial reduction of hours can be effected without any reduction of output. Whereas at the beginning of the war there was a general belief that longer hours necessarily produced larger output, it has now become widely recognized that a 13 or 14 hours' day for men and a 12 hours' day for women, excepting for quite brief periods, are not profitable from any point of view. Few, probably, would disagree with the statement contained in the summary prepared by the Right Hon. G. N. Barnes, M. P., of the recent reports of the commissions on industrial unrest that—

"There is a general consensus of opinion that Sunday and overtime labor should be reduced to a minimum, that holidays should not be curtailed, and that hours of work should not be such as to exclude opportunities for recreation and amusement."

It must be obvious that any reduction of hours which can be accomplished without loss of output is profitable not only to the employer, in that it reduces running expenses, but to the worker, since even if his or her daily measure of work involves the same amount of fatigue a longer period is left for recovery and for the enjoyment of adequate sleep and recreation.

11. It must be recognized that the conditions are not the same now as they were in the early days of the war; not only have large numbers of the youngest and strongest workers been withdrawn for military service, but those who remain are suffering from the strain inseparable from a continuous period of long hours of employment. To this must be added the strain caused by family and other anxieties arising out of the war. While much has been done to improve conditions of employment they are still in many cases far from ideal, notably as regards housing and transit. Further, large numbers of women are now employed on heavy work and on skilled operations involving constant thought and attention, which were considered two years ago to be quite beyond their capacity. It may be true that no serious breakdown of health has as yet been observed among the great mass of the workers, but it can not be assumed that this condition will continue indefinitely. The effects of the strain may even have been already more serious than appears on the surface, for while it is

possible to judge roughly the general condition of those working in the factory to-day, little information is available concerning the large number of workers who for one reason or another, and often because they find the work too arduous, are continually giving up their job. This is an important point which is liable to be overlooked, since the supply of labor has hitherto been adequate to fill their places. The irritability and nervousness mentioned by the commissions on industrial unrest are moreover well recognized symptoms of fatigue, while it must not be forgotten that the effects of fatigue are accumulative.

12. After careful consideration of all the circumstances, the committee are convinced that the maximum limits of weekly employment provisionally suggested are too high except for quite short periods, or perhaps in cases where the work is light and the conditions of employment exceptionally good. In the great majority of cases, however, the hours of work should now be restricted within limits lower than those quoted in paragraph 2 above. It is impossible to lay down a single rule as to the best hours in all cases; the best scheme can only be determined after a careful consideration of a number of different factors, e. g.—

(a) The strain involved in the work, its character (heavy or light, continuous or intermittent) and the mental demand which it makes upon the worker.

(b) The extent to which the pace of the work is governed by the machine.

(c) The factory environment—temperature, ventilation, etc.

(d) The individual physical capacity of the workers, and their age, sex, and experience.

(e) The organization of the factory (including welfare supervision.)

(f) The sufficiency and suitability of the worker's food, canteen accommodation, etc.

(g) The arrangements of the hours of work (spells, breaks, and pauses).

(h) Conditions outside the factory—e. g., housing and transit.

In arranging the hours of work for a factory, allowance should be made, as far as discipline and organization permit, for the fact that the best hours of employment will not be the same for all processes, even in the same factory.

13. In conclusion the committee desire to urge the view that the time is now ripe for a further substantial reduction in the hours of work. If this be effected with due regard to the varying conditions prevailing in different branches of industry, they are satisfied that reductions can be made with benefit to health and without injury to output.

Signed on behalf of the committee.

GEORGE NEWMAN, M. D., *Chairman*.

E. H. PELHAM, *Secretary*.

OCTOBER, 1917.

CHANGES IN OCCUPATIONS OF WOMEN AND GIRLS IN GREAT BRITAIN DURING THE WAR.¹

An analysis has been made of the prewar occupations of 524,000 women and girls to whom unemployment books were issued up to January, 1917, under the National Insurance (Part II) Munition Workers Act of 1916. Of these 444,137 (380,470 women and 63,667 girls) stated their occupations definitely enough to make a tabulation possible. In the following table the numbers insured in

¹ The Labour Gazette, London, December, 1917, p. 438.

different groups of trades at January, 1917, are classified so as to show their prewar occupations:

Prewar occupations.	Occupations at January, 1917.				
	Metal trades (excluding engineering).	Chemical trades (including small arms).	Clothing trades.	Other trades.	All insured trades.
Same trade.....	53,249	14,634	38,256	30,399	136,538
Household duties, and not previously occupied.....	18,927	52,407	9,334	17,843	98,511
Textile trades.....	3,408	6,226	1,000	4,374	15,008
Clothing trades.....	4,635	17,941	8,430	8,787	39,793
Other industries.....	12,458	20,879	5,745	10,065	49,147
Domestic service.....	12,502	44,438	4,970	12,062	73,992
Other nonindustrial occupations.....	5,449	17,079	3,643	4,977	31,148
Total insured.....	110,628	173,604	71,378	88,507	444,137

Subtracting the number of persons who have remained in the same trade it will be seen that the table accounts for nearly 308,000 persons who have changed their occupations. In July, 1917 (the latest date for which figures are available), the numbers of women drawn into industrial work, using the term to include Government establishments, was 720,000, or rather more than double the number drawn into the trades here considered. The proportion of the total increase covered by these figures is therefore sufficiently large to be taken as fairly typical. Assuming that the whole of the increase of 720,000 could be accounted for in the same manner as the increase analyzed above, it would mean that it was made up of 231,000 women and girls who were previously unoccupied, 173,000 who were domestic servants, 243,000 who came from other industries, including 93,000 from the clothing trades, and 73,000 from nonindustrial occupations other than domestic service. These figures can, of course, only be taken as a rough indication of the change that has taken place, but they must be sufficiently near the truth to be of considerable interest.

The fact that so many persons have left a trade can not be taken to indicate that the numbers employed have decreased by an equal amount, as these trades in their turn have drawn in workers from the outside. Thus, in January, 1917, at the date to which these figures refer, taking the clothing trades as a whole, the numbers of women and girls employed had decreased by 32,000, whereas it appears from the above table that the newly insured trades alone had drawn in nearly 40,000 females from the clothing trades, which must therefore have found at least 8,000 workers from outside. In the textile trades the loss shown in the table is 15,000, although at

that time the textile trades had increased the numbers of female employees by 25,000.

To turn to the individual trades insured under this act, by far the largest are the chemical trades, under which heading the manufacture of explosives and small arms is classified, and which, consequently, include large numbers of women in Government establishments. Next to these in size come the metal trades; but it must be remembered that persons engaged in the engineering trades were already insured under the act of 1911, and consequently, are not included in the above figures. The figures for the chemical trades, on the other hand, cover the large majority of women who are now working in those industries, and are therefore of very considerable importance. It is noticeable that they have drawn in workers from other industries to a far greater extent than the metal trades. This is illustrated more clearly in the following table, which shows what percentage of the total classified for each group of insured trades had been previously employed in the same occupation and what percentage had been drawn from the various other occupations.

Prewar occupations.	Occupations at January, 1917.				
	Metal trades.	Chemical trades.	Clothing trades.	Other trades.	All insured trades.
Same trade.....	48.1	8.4	53.6	34.3	30.7
Household duties, and not previously occupied.....	17.1	30.2	13.1	20.2	22.2
Textile trade.....	3.1	3.6	1.4	4.9	3.4
Clothing trade.....	4.2	10.3	11.8	9.9	9.0
Other industries.....	11.3	12.0	8.0	11.4	11.1
Domestic service.....	11.3	25.6	7.0	13.7	16.6
Other nonindustrial occupations.....	4.9	9.9	5.1	5.6	7.0
Total insured.....	100.0	100.0	100.0	100.0	100.0

It will be seen that 48.1 per cent of the women and girls in the metal trades insured under the act had been previously employed in the same trade, 51.9 per cent being drawn in from other occupations. In the chemical trades, on the other hand, as many as 91.6 per cent of the total had come from other occupations. The difference in this respect between the two trades is, of course, due to the great developments in the manufacture of explosives and in the filling factories, in which much of the work is entirely new, or on which only a very small number of persons were engaged before the war. The chemical trades have, therefore, been forced to recruit largely from outside; over 30 per cent of the total employed were unoccupied before the war or were engaged in household duties, nearly 26 per cent were drawn from industries, and an almost equal number from domestic service. If all the insured trades be taken together, 31 per

cent of the women classified had not changed their occupations, 22 per cent were previously unoccupied or were engaged in household duties, 23 per cent came from other industries, and 17 per cent from domestic service; that is to say, of the women and girls then employed in the munition trades which come under the insurance act over half of the total had been previously unoccupied or had been in the same trades, while nearly a quarter had had other industrial experience, the remainder being drawn from nonindustrial occupations, primarily domestic service.

PRICES AND COST OF LIVING.

RETAIL PRICES OF FOOD IN THE UNITED STATES.

PRICES IN DETAIL, DECEMBER, 1917.

The increase in the retail price of food, as a whole, in December, 1917, over November, 1917, was 1 per cent. Of the 27 articles for which prices are received by the Bureau of Labor Statistics, 8 articles decreased in price, 3 remained the same, and 16 increased as compared with the prices for November.

Onions show the greatest decrease, or 14 per cent; bread decreased 5 per cent; potatoes 3 per cent; pork chops, flour, and prunes 2 per cent each. Sugar and beans each show a decrease of 1 per cent. Eggs show the greatest increase, or 9 per cent. Butter and hens each increased in price 3 per cent. Rice, milk, lard, and chuck roast each show an increase of 2 per cent.

The following table shows the course of prices in the United States in November and December, 1917:

AVERAGE MONEY RETAIL PRICES AND RELATIVE RETAIL PRICES OF FOOD ON NOV. 15 AND DEC. 15, 1917.

[The relative price shows the per cent that the average price on the 15th of each month was of the average price for the year 1916.]

¹ 16 ounces, weight of dough.

In the year from December 15, 1916, to December 15, 1917, prices of food as a whole advanced 24 per cent. Potatoes and onions are the only articles that show a decline. Potatoes decreased in price 10 per cent and onions 12 per cent. The article showing the greatest increase is corn meal, which was 80 per cent higher in December, 1917, than in December, 1916. In this year, bacon increased 63 per cent; pork chops, 52 per cent; beans, 32 per cent; milk and ham, 31 per cent, each; lard, 28 per cent; rice, 27 per cent; hens, 26 per cent; flour, 23 per cent; eggs and bread, 20 per cent, each.

Food as a whole was 52 per cent higher on December 15, 1917, than on December 15, 1913, and 50 per cent higher than on either December 15, 1914, or December 15, 1915. During this four-year period, corn meal advanced 127 per cent; lard, 111 per cent; flour, 108 per cent; bacon, 83 per cent; sugar, 76 per cent; pork chops and potatoes, 67 per cent, each; ham, 64 per cent; milk, 44 per cent; butter, 37 per cent; and eggs, 33 per cent. No article declined in price.

A table showing the average and relative retail prices in December of each year from 1913 to 1917 follows:

AVERAGE MONEY RETAIL PRICES AND RELATIVE RETAIL PRICES OF FOOD ON DEC. 15 OF EACH YEAR, 1913 TO 1917, INCLUSIVE.

The relative price shows the per cent that the average price on December 15 of each year was of the average price for the year 1916.]

¹ 16 ounces, weight of dough.

The two tables which follow give average retail prices for 29 articles in 45 cities.

For 16 cities, average prices are shown for December 15, 1913, December 15, 1916, and for November 15 and December 15, 1917. No

prices are given for meats in Atlanta, Ga., as less than 80 per cent of the butchers of that city sent in their reports for December, 1917, to the bureau.

For 29 cities, average prices are given for December 15, 1917. No prices are given for groceries in Charleston, S. C., since less than 80 per cent of the grocers of that city sent in their reports to the bureau.

It is manifestly unfair to attempt any comparison of prices between cities widely separated or between localities where qualities and market conditions vary greatly. For no article is it possible to quote prices on an identical grade throughout the 44 cities, as the grade varies not only from city to city but also from firm to firm within the same city and from month to month within the same store. Stores which vary in a marked degree the grade of articles handled from day to day or from month to month have not been included, but in every store there is necessarily some variation in grade. Methods of cutting beef differ considerably in different cities, and to some extent this affects retail prices. Emphasis should be placed upon the fact that, according to the method of cutting followed in Boston, Mass., Manchester, N. H., Philadelphia, Pa., and Providence, R. I., no cut corresponds to the cut known as sirloin in other cities. In these four cities the cut known as sirloin corresponds to the cut described above as porterhouse, and in this report the quotations of prices for the cities just named are for the cut known locally as sirloin. The cut commonly known as sirloin is sold in Fall River, Mass., under the name of "rump" steak, and in this report the prices quoted for that city are for the article known locally as "rump" steak. While the grade of beef quoted is not identical throughout the 44 cities, nor is the grade always identical in a store throughout the period for which prices are quoted, the article quoted is the best grade of meat on sale at the date of each quotation in the store selected, and the stores selected are those patronized largely by the families of American, English, Irish, German, and Scandinavian wage earners.

Below are given a few "remarks" taken from bakery reports of December 15. On many of the slips the note was made that the changes in weights and prices were due to the recent Government regulation.

Owing to the new formula now in use, our retail price has been reduced 1 cent per loaf this month.

Our change in weight complies with the rules of the Food Administration, the price to conform with ingredients.

Weights are changed to conform with Government regulation. Prices are the same per pound. Sealing weight is increased because of reduction of sugar

and shortening. Increased weight of dough, together with malt extract, have more than offset saving in sugar and shortening.

AVERAGE RETAIL PRICES OF THE PRINCIPAL ARTICLES OF FOOD FOR 16
SELECTED CITIES FOR DEC. 15, 1913, 1916, AND 1917, AND NOV. 15, 1917.

[The average prices shown below are computed from reports sent monthly to the bureau by retail dealers. As some dealers occasionally fail to report, the number of quotations varies from month to month.]

RELATIVE PRICES, 1907 TO DECEMBER, 1917.

To afford an opportunity to compare average yearly retail prices of food back over a period of years, index numbers, computed from data collected by the United States Bureau of Labor Statistics, are given in the table following. In this table the average price for 1913 is taken as the basis, or 100. These index numbers are simply percentages in which comparison is made with the average price in 1913. Interpreted in dollars, the food that cost \$1 in 1913 cost \$1.46 in 1917, while the same food cost but \$0.82 in 1907, \$0.84 in 1908, etc.

The increase in the retail price of food in 1917 over 1916 was 29 per cent. Comparing 1917 with 1907, there is an advance in the index number from 82 to 146, an increase of 64 points, which number, 64, is 78 per cent of 82, making the increase 78 per cent.

Prices for chuck roast, plate boiling beef, and bread were secured first in 1914; and those for cheese, rice, beans, coffee, tea, salmon, onions, prunes, and raisins in 1915. Relative numbers for these articles, therefore, can not be computed on the 1913 base.

Beginning with 1914, chuck roast, plate boiling beef, and bread, and beginning with 1915, cheese, rice, coffee, and tea, have been included in the index numbers for all articles combined, weighted according to amount of consumption. As the bureau has no figures of the family consumption of beans, salmon, onions, prunes, and raisins, these articles have never been included in the weighted index tables.

The effect of the war on food prices can be followed in this table from year to year and from month to month.

RELATIVE RETAIL PRICES, PER CENT OF INCREASE OR DECREASE OF THE PRINCIPAL ARTICLES OF FOOD IN THE UNITED STATES, 1907, TO DECEMBER, 1917, BY ARTICLES.

WHOLESALE PRICES IN THE UNITED STATES.

PRICE CHANGES FOR IMPORTANT COMMODITIES SINCE JULY, 1914.

Figures compiled by the Bureau of Labor Statistics show the wholesale prices of food and other commodities for a date just prior to the outbreak of the European war, and subsequent dates indicating the movement of prices as affected by the war. During the latter half of 1917 many of these commodities had more than doubled and others were three times as much as in July, 1914. Among the articles showing the largest increases were hogs; bacon; lard; sheep; mutton; butter; eggs; wheat flour; corn; corn meal; cotton, woolen, and leather goods; coke; coal (bituminous); pig iron; steel billets; tinplate; lead; crude petroleum; and gasoline. Many of these commodities, however, declined in price during the closing months of the year, due largely to Government regulation.

A comparison of wholesale prices of important commodities in representative markets since July, 1914, is contained in the two tables which follow. The average money prices for the specified month are shown in the first table. The relative prices in the second table are based on the actual prices, the prices for July, 1914, being taken as 100.

WHOLESALE PRICES, JULY, 1915 AND 1916, AND JANUARY TO DECEMBER, 1917, COMPARED WITH JULY, 1914.

Actual Money Prices.

INDEX NUMBERS, BY GROUPS OF COMMODITIES, 1913 TO 1917.

The great increase that has taken place in the wholesale prices of important commodities in the United States since 1913, the year preceding the outbreak of war in Europe, is shown by information collected by the Bureau of Labor Statistics of the United States Department of Labor. This increase has been particularly great among farm products, foods, clothing, metal products, and drugs and chemicals. During 1914 the prices of most commodities increased between January and September, but declined rapidly in the closing months of the year, due to the prevailing business stagnation brought about by the war. Among articles classed as fuel and lighting, metals and metal products, and lumber and building materials prices declined throughout the year.

In 1915 a reaction occurred and prices again advanced, reaching high levels late in the year. Since January, 1916, the rise in wholesale prices has been unprecedented. The bureau's weighted index number, based on 292 separate articles or price series, stood at 181 in December, 1917, as compared with 110 in January, 1916, and 100 as the average for the 12 months of 1913. In the same period, January, 1916, to December, 1917, the index number of farm products increased from 108 to 204, that of food articles from 114 to 185, and that of cloths and clothing from 110 to 206. These facts are clearly brought out in the table which follows:

106 MONTHLY REVIEW OF THE BUREAU OF LABOR STATISTICS.

INDEX NUMBERS OF WHOLESALE PRICES, BY GROUPS OF COMMODITIES AND BY YEARS AND MONTHS, 1913 TO 1917.

COMPARISON OF PRICE CHANGES, WHOLESALE AND RETAIL, IN THE UNITED STATES.

Figures compiled by the Bureau of Labor Statistics furnish a comparison of wholesale and retail price changes among a number of important food articles since 1913. In collecting data for the comparison it was found that in some instances slight differences of grade or quality existed between the articles for which wholesale prices were obtainable and those for which retail prices could be secured. It was found impracticable, also, in most instances to obtain both kinds of quotations for the same date. The retail prices shown are uniformly those prevailing on the 15th of the month, while the wholesale prices are for a variable date, usually several days in advance of the 15th. For these reasons exact comparison of retail with wholesale prices can not be made. The figures are believed to be of interest, however, in showing price variations in the retail as compared with the wholesale markets.

In the following table the wholesale price is in each case the mean of the high and the low quotations on the date selected as published in leading trade journals, while the retail price is the average of all prices reported directly to the bureau by retailers for the article and city in question. The initials W. and R. are used to designate wholesale and retail prices, respectively.

WHOLESALE AND RETAIL PRICES OF IMPORTANT FOOD ARTICLES IN SELECTED CITIES.

(The initials W=wholesale; R=retail.)

Relative wholesale and retail prices, expressed as percentages of the average money prices for 1913, are contained in the table which follows. A few articles included in the preceding table are omitted from this one, owing to lack of satisfactory data for 1913. It will be seen from the table that since the beginning of the present year the retail prices of most of the commodities included in the exhibit have fluctuated at a relatively lower level, as compared with their 1913 base, than have the wholesale prices. This is particularly noticeable in the case of bacon, lard, dressed lamb, butter, milk, eggs, flour, corn meal, and potatoes. Comparing December prices with the average for 1913, it is seen that only 2 articles of the 28 included in the table show a larger per cent of increase in the retail than in the wholesale price. These are dressed poultry and granulated sugar at New York. In most of the other months of 1917 the retail prices of these articles were relatively lower than were the wholesale prices.

CHANGES IN COST OF ARMY AND NAVY RATION.

As an index of the rise in prices in the United States fluctuations in the annual and per diem cost of the Army and Navy ration may be of interest. A brief tabular statement showing the changes of the actual annual and per diem cost per man for subsistence in the United States Army and Navy has been compiled from the annual report of the Quartermaster General of the Army and of the Paymaster General of the Navy, and the result is presented in the following table:

CHANGES IN COST OF THE ARMY AND NAVY RATION, 1911 TO 1917.

Year.	Cost of Army ration.		Cost of Navy ration.		Relative: 1917=100.	
	Annual.	Daily.	Annual.	Daily.	Army.	Navy.
		Cents.		Cents.		
1911.....			\$131.72	36.91		81.2
1912.....			133.55	36.59		81.4
1913.....	\$108.75	29.79	137.28	37.61	89.6	85.8

1916.....	102.17	27.99	137.42	37.65	84.2	85.9
1917.....	121.36	33.25	159.91	43.81	100.0	100.0

COURSE OF RETAIL PRICES OF FOOD IN THE UNITED KINGDOM,
1914 TO 1917.

The following table, taken from the Labor Gazette of the British Ministry of Labor for December, 1917, shows by months the percentage of increase in retail prices of food in the United Kingdom since July, 1914. The figures are a correct measure of the general level of prices, on the assumption that the prewar quantities of the various articles were bought throughout the period covered, but as it is well known that the articles were not always obtainable in the same quantity it is quite clear that the figures should not be used as a measure of the rise in the actual expenditure on food.

AVERAGE PERCENTAGE INCREASE SINCE JULY, 1914, IN RETAIL PRICES OF FOOD.

Month (beginning of).	1914	1915	1916	1917
January.....		13	45	87
February.....		22	47	89
March.....		24	48	92
April.....		24	49	94
May.....		26	55	98
June.....		32	59	102
July.....		32½	61	104
August.....	15	34	60	102
September.....	10	35	65	106
October.....	12	40	68	97
November.....	13	41	78	106
December.....	16	44	84	105

¹ This percentage relates to prices on Aug. 8, 1914. On that date they were not so high as three or four days earlier.

The average percentage of increase on December 1, 1917, as compared with July, 1914, for certain specified articles of food in the descending order of the magnitude of the increase is shown in the following statement:

	Per cent.		Per cent.
Fish.....	191	Eggs (see text).....	95
Sugar (granulated).....	188	Cheese.....	92
Meat, imported..... ¹ 115 to	161	Meat, British..... ¹ 75 to	100
Bacon.....	134	Margarine.....	65
Tea.....	107	Bread.....	54
Butter.....	99	Flour.....	52
Milk.....	96	Potatoes.....	39

For eggs the percentage shown relates to July, 1917, and not to December, 1917, as the seasonal change in prices of eggs is so great that the December percentage would be valueless for comparative purposes. With regard to meat it may be remarked that the diversity in percentages arises from the disparity in the prices of different cuts, and that the actual amount of average increase shows much less variation, the range 6½d. to 8½d. (13 to 17 cents) per pound covering six of the eight cuts included in the figures.

² According to description.

The figures showing the percentage of increase between July 14, 1914, and December 1, 1917, in the retail prices of a number of groceries of less importance in working-class dietaries are given in the following statement:

	Per cent.		Per cent.
Lentils, split (red)-----	230	Milk, condensed-----	120
Peas, split (yellow)-----	210	Beans, butter-----	110
Sago-----	190	Jam-----	110
Tapioca-----	160	Rice, Rangoon-----	100
Sirup-----	160	Cocoa (loose)-----	95
Beans, haricot-----	140	Coffee-----	30
Oatmeal, Scotch-----	140		

The average rise with these secondary items is clearly greater than with the principal foodstuffs.

CAUSES FOR INCREASE OF PRICES OF CERTAIN COMMODITIES IN GREAT BRITAIN.

In 1916 a departmental committee of the British Board of Trade was appointed to determine the causes for the increase of prices of certain commodities since the beginning of the war. On September 22, 1916, this committee submitted an interim report on meat, milk, and bacon prices, a summary of which appeared in the MONTHLY REVIEW for January, 1917 (pp. 51 to 56). On November 15 and December 31, following, the second and third (final) interim reports, respectively, were filed with the president of the Board of Trade, the two reports constituting a single pamphlet of 22 pages.¹ As a part of the second report, which takes up the prices of bread, flour, and wheat, the committee has made a statement concerning the closely connected problems of the shortage of shipping and the increase in freight charges. The third interim report deals with potato, tea, and sugar prices.

Before the war the average price of a 4-pound loaf of bread, according to the report, was slightly over 5½d. (11.7 cents). A material advance, beginning in December, 1914, and continuing until the following June, raised the average price to 8½d. (17.2 cents) per four pounds. A gradual fall in price then occurred, succeeded by another advance during the winter of 1915-16, when the average price was nearly 9d. (18.3 cents), and by a still further advance in November, 1916, when the average price was just over 9½d. (19.3

¹ Great Britain. Departmental committee on prices. Committee appointed by the Board of Trade to investigate the principal causes which have led to the increase of prices of commodities since the beginning of the war. Second and third interim reports. cents), or an increase of approximately 65.2 per cent over the prewar price.

A rise in the price of flour is given as the principal cause for this increase in the price of bread. A table in the report shows that at Liverpool, in the period January to July, 1914, the price of bakers' grade flour had advanced from 25s. 8d. (\$6.25) per sack of 280 pounds to 53s. (\$12.90) in October, 1916, an increase of 106.4 per cent. By the beginning of November, 1916, it is stated, the average retail price of household flour in the United Kingdom, which had been about 10½d. (21.3 cents) per 7 pounds before the war, had risen to 1s. 6d. (36.5 cents), an increase of 71.4 per cent. The increase in the wholesale price, in turn affecting the retail price, is declared to have been due to the great advance in the cost of wheat to the millers. The same table noted above shows an increase in the prices of wheat ranging from 32s. 3d. (\$7.85) for British wheat before the war to 60s. 7d. (\$14.74) in October, 1916, an increase of 87.8 per cent; and from 35s. 7d. (\$8.66) for Canadian wheat at London before the war to 77s. (\$18.74) for the same wheat at London in October, 1916, an increase of 116.4 per cent.

This advance in wheat prices the report attributes to several factors, among which are inaccessibility of the supplies of Russia and the Balkan States, heavy consumption by the armies, the necessity of accumulating emergency stocks in the countries of the entente, combined with the requirements of several neutral countries, and the decrease in tonnage available to transport wheat resulting in a rise in ocean freight charges.

The committee found in its investigation of the matter of freight rates as related to the increase in the prices of wheat and flour, and indirectly bread, a wide difference in tariffs in the period January to March, 1914, as compared with the period July to September, 1916. To illustrate, a table is given showing that the ocean freight rate on grain from New York was 1s. 2d. (28.4 cents) per quarter (28 pounds) in the first period and 9s. 8d. (\$2.35) in the second period, an increase of 729 per cent; and that the rate on grain from Argentina (down river) was 9s. 10d. (\$2.39) per ton during the first period and 140s. 6d. (\$34.19) during the second period, an increase of 1,329 per cent. The chief reasons ascribed by the committee for this condition are shortage in the amount of shipping available for mercantile purposes due principally to its diversion to naval and military uses, the increased cost of working the ships, the withdrawal of the German mercantile marine, and the shortage of labor and congestion at the docks. The committee at this point gives a brief review of the measures taken by the Government to control British shipping, thus effecting a reduction in freight rates, many of the rates being

considerably below the market quotations. The advisability of further governmental control is suggested. The second interim report of the committee concludes with the following recommendations:

1. Since the sharp rise in the price of home-grown supplies of wheat will, in our opinion, continue unless there is prompt Government action, we recommend that the Government should immediately fix such a maximum price to the producer for marketable home-grown wheat as will protect the public, while securing to the farmer a reasonable profit.

2. That simultaneously with this measure, fair contract prices, at which the farmers of the United Kingdom should be asked to grow wheat and oats for the Government in the cereal year 1916-17, should be fixed and published.

3. That maximum prices, corresponding with the cost of wheat, both home-grown and imported, as determined by the Government, should be immediately fixed and announced for home-milled flour and offals in the cereal year 1916-17.

4. That the Government should add control of the import of maize to its control of the import of wheat.

5. That the Government of India should at once take steps to induce native cultivators to place as large an area as possible under cultivation for wheat to be harvested in the cereal year 1916-17, and that, if necessary, the home Government should guarantee a contract price.

6. That the Government of the United Kingdom should consider the desirability of discussing with the Government of Egypt the suitability for Egypt of a policy similar to that recommended for India, including a guarantee by the Government of the United Kingdom.

7. That the British mercantile marine should be further controlled by the Government to the end that foods and the raw materials of essential industries shall have precedence of other goods, and be carried at fair and reasonable rates.

8. The congestion of shipping in British ports, referred to in our previous report, has not, we fear, been wholly remedied. A more serious congestion, further, appears to have arisen in certain allied ports. We therefore urge anew that much waste of tonnage occurs through such congestion, and that it is the pressing duty of our own and the allied Governments specially concerned to remedy the evil.

THIRD INTERIM REPORT.

The third interim report of the departmental committee on prices, submitted on December 20, 1916, is confined to a consideration of increases in the prices of potatoes, tea, and sugar. As to potatoes, it seems that no serious increase occurred after the outbreak of the war until April, 1916, when the average price was 151s. 6d. (\$36.86) per ton, as compared with 87s. 6d. (\$21.29) in June, 1914, an increase of 73 per cent. This price rose to 245s. (\$59.61) in June, 1916, an increase of 180 per cent over the June, 1914, price. This rise in price, the committee states, was due to reductions in the quantity brought to market, the feeding of potatoes to live stock, bad weather when the crop was ready for digging, military drain on farm labor, a falling off in the acreage planted, an increase in the cost of production, and, possibly, a certain amount of speculation, combined with undue withholding of supplies from market by large growers and dealers.

The retail price of tea was found to have increased, since the war began, approximately 50 per cent, inclusive of import duty, the average price just preceding the report of the committee being rather more than 9d. (18.3 cents) per pound in excess of the price in July, 1914. Of this increase, 7d. (14.2 cents) is accounted for by increased taxation. The chief causes given for this advance in price are said to be difficulties in maintaining supplies, owing to scarcity of shipping, the risk of ocean transport, and also a strong competitive demand arising from heavy Army requirements and the desire of traders to maintain adequate stocks to provide for the needs of their customers. The evidence also seemed to indicate heavy speculative buying.

The rise in the price of sugar (exclusive of duty) since the beginning of the war has been proportionately greater than that of any of the other main articles of food, declares the report, the average price of white granulated sugar having increased by 170 per cent in the United Kingdom generally. At the beginning of the war the price was approximately 2d. (4.1 cents) per pound; in December, 1916, at the time of this report, it was about 5½d. (11.2 cents). A sudden rise immediately after the beginning of the war is accounted for by excited buying on the part of the public, combined with the stoppage of imports from Germany and Austria-Hungary, and with interruptions to shipments from other quarters. The situation was relieved by the Government, which purchased large supplies and appointed a royal commission to take them over and generally to control the further importation and the distribution. But the relief was only temporary; decreased supplies caused a further advance in price. Further factors, noted by the report, in the rise of prices, especially during 1916, were an increase in the charges for docking and handling in the ports and in the working expenses, including wages, cost of conveyance, packages, petrol, horse keeping, repairs, etc., at the refineries and in the different stages of distribution. The report says:

The refiners' profits are limited, their selling prices being prescribed by the royal commission on a basis regulated in accordance with the price at which the raw sugar imported is issued to them. In addition, any profit made in excess of the prewar figures plus an agreed percentage is recovered by the royal commission. The profits of the wholesale distributors are also limited to 1½ per cent of the price, including duty * * *. The Commission itself aims at adding only such a fraction to the cost as will meet insurance and working expenses, and provide a sufficient reserve fund to enable uniformity of price to be maintained and to provide a balance in hand to meet any possible reduction in prices at the close of the war.

Wholesale prices being thus regulated by the royal commission, the prices charged by retailers are also watched. Owing to the variations in the cost of transport from the ports to different towns, and in the terms upon which dif-

ferent traders purchase their supplies, no attempt is made to prescribe a uniform retail price for the country as a whole; but action is taken to deal with any efforts which may be made by individual traders to exact grossly excessive prices. For standard granulated sugar, the present wholesale price to the first-hand buyers, including duty, is 41s. 7½d. [\$10.13] per hundredweight (less 1¼ per cent) which, after allowing for a fair profit to the distributors, will in most cases permit the retailer to sell at 5d. [10.1 cents] per pound at the port. When the sugar has to travel to a place in the country ordinarily well served by transport facilities, it is considered that 5½d. [10.7 cents] will usually give a fair rate of profit to the retailer.

The shortage during 1916, and consequent rise in prices, was, however, due primarily, it was found, to the scarcity of available shipping which made it necessary in the national interests to reduce the amount of tonnage placed at the disposal of the sugar commission and by the increase in the army requirements of sugar.

Summarizing, the following table indicates the changes in prices of commodities noted in this article:

RISE IN PRICES OF CERTAIN COMMODITIES IN GREAT BRITAIN DUE TO THE WAR.

Commodity.	Unit.	Average price July, 1914.	Average price June, 1915.	Average price October, 1916.	Per cent of increase, 1916 over 1914.

BREAD RATIONING IN FRANCE.¹

On November 30, 1917, the council of ministers approved a decree organizing a system of bread rationing. The basis adopted limits the amount of grain to be released for the manufacture of bread, the army. Bread tickets are to be issued and distributed by a communal office in communes of more than 20,000 population. In fixing the amount of grain to be released for the manufacture of bread, the needs, habits, and interests of consumers, producers, and intermediaries have been considered. The prefect of each Department estimates the amount of grain necessary, which is thereupon distributed to the millers authorized to furnish flour.

¹ La République Française, Dec. 1, 5, and 10, 1917.

A permanent supervising cereal office is established in each Department. All flour mills are placed under State supervision and, in general, all cereals are requisitioned. The State may purchase the grain through committees, millers, or merchants operating as State agents, or acquire it through direct requisition.

The weight, bake, and form of the loaf are not regulated, but all breads, including fancy, health, and diet bread, must be sold by weight, and made from whole wheat flour, excluding impurities only. The price will be uniform in all parts of the State, except as it may be influenced by local conditions.

The use of bread flour for pastry making is prohibited. Pastry made from other materials may only be sold on two days each week. Bread consumers are divided into three classes as determined by age, social condition, etc. The classes with the daily rations allowed are as follows:

1. Those performing heavy manual labor, and having a small income:
 Men over 16 years of age ----- 600 grams (21.2 ounces).
 Women over 16 years of age ----- 500 grams (17.6 ounces).
2. Those doing light work, and having a small income:
 Men over 16 years of age ----- 400 grams (14.1 ounces).
 Women over 16 years of age ----- 300 grams (10.7 ounces).
3. All persons not included in above classes ----- 200 grams (7 ounces).

Supplies are delivered upon presentation of authorized cards issued by the minister through local authorities. The cards are individual, in the name of the applicant. The holder is required to sign the card for himself and minors. The communal office distributes the cards, supervises their use, and cancels such as were issued to deceased persons or to persons who remove. With each card sufficient tickets are issued in amounts of 100 grams each to cover the monthly allowances in favor of the holder.

Cards with all stubs of used tickets and unused tickets are returned at the end of the month, and a new issue made. Provisions are made for issuing tickets to persons temporarily away from their homes, to soldiers on leave or furlough, and to persons temporarily sojourning in a commune. Loaned or sold cards are confiscated. Stolen, lost, or destroyed cards or coupons are not, in general, replaced, but such theft, loss, or destruction must be immediately reported. Makers or users of false books or tickets are subject to prosecution.

Delivery of bread by bakers, restaurant, hotel, or boarding-house keepers otherwise than in exchange for tickets is prohibited. Tickets will be received in exchange for current bread only, or for the equivalent in flour, fancy, diet, or health bread in proportions indicated in a table of equivalents prepared by the public authorities and posted

in the place of sale. Bakers living in a commune not under the card system are not permitted to supply customers living in a commune in which the system is in operation.

Sale of fancy bread, pastry, and confectionery to be eaten on the premises is prohibited.

Provision is made to meet extraordinary demands caused by temporary increase of population. The supply of flour will be withheld from bakers, etc., for failure to observe these regulations.

The decree became effective in Paris and the Department of the Seine on December 20, 1917.¹

PRICES OF FOOD IN NEW ZEALAND.²

In compliance with the cost-of-living act of 1915, the Board of Trade of New Zealand, constituted on March 1, 1916, presented its report covering the period March 1, 1916, to March 31, 1917.

The board was authorized to investigate infringements of the provisions of the commercial trust law of 1910; matters affecting cost of living; supply, demand, and prices of commodities; complaints of unreasonably high prices; questions relating to trade, commerce, or business of New Zealand; markets for goods of home production; and to make recommendations in regard to trade, markets, and means for the encouragement, development, and protection of industry and commerce.

At its first meeting the board decided to investigate the principal causes of high prices.

The first subject considered was wheat and its milled products. The conclusion states that "The distribution of the food supply * * * can not safely be left in a time of crisis to the working of an unregulated system of supply and demand. Prices of flour and by-products require continuous scrutiny. Dealers in grain should be registered and be required to report quantities purchased and prices paid."

In considering price fixing, "recommended prices" instead of "maximum prices" were considered preferable. Subsequent price movements, however, seemed to warrant Government control. The danger of the policy of noninterference was demonstrated by an unwarranted advance of 25 per cent in the price of flour in November, 1916. The Board of Trade thereupon resolved that "It is desir-

¹ La Republique Française, Dec. 19, 1917.

² First annual report of the Board of Trade, Wellington, 1917, 26 pp.

able for the Government to fix the maximum price of wheat," "that wheat and flour shall be handled at reasonable rates by merchants, millers, and bakers," and recommended a maximum for best quality of wheat of 6s. 3d. (\$1.52) per bushel at country stations.

At a conference of flour millers the following resolutions were adopted: The price of flour should be based upon 48 bushels of wheat yielding 1 ton of flour. The price of pollard (middlings) and bran should be fixed at £6 (\$29.20) and £4 (\$19.47), respectively, per ton. When the price of wheat is 5s. (\$1.22) per bushel the price of flour should be £13 10s. (\$65.70) per ton. In consideration of the restoration of "flour duty" and "dumping legislation" forthwith flour should not exceed £14 (\$68.13) f. o. b. less $2\frac{1}{2}$ per cent at wheat centers until the Government scheme comes into force.

Evidence was given placing the cost of production at £5 10s. (\$26.76) to £8 (\$38.93) per acre (including interest on wheat land). Based upon available reports, the average actual yield was 23.09 bushels per acre. It was evident that the Government should control the present supply and encourage production. The course finally agreed upon fixed a maximum price for the 1915-16 crop, and a guarantee of 5s. 10d. (\$1.42) per bushel for the crop of 1916-17. Prices of bread were not fixed. Local and ordinary competition "worked on the whole satisfactorily."

Early in December, 1916, reports seemed to indicate a short crop, and the board recommended that the Government acquire an option on 1,500,000 bushels of Australian wheat. Since the ending of the financial year 1,000,000 bushels have been purchased and are being distributed under the supervision of the board.

Local prices of butter rose in sympathy with the record prices ruling in Great Britain. Placing the index number of the price of butter at approximately 105 on April 11, 1914, it rose to 225 on March 7, 1917. Both wholesalers and retailers threatened further advances, and factories threatened "if prices were interfered with they would withdraw supplies from the local market entirely and export their whole output."

The Regulation of Trade and Commerce Act provided that—

"Nothing in this act relative to maximum prices shall extend or apply to the sale of goods which are destined by the purchaser, or believed by the seller on reasonable grounds to be so destined, for exportation and not for consumption in New Zealand." This precluded any remedy by fixation of maximum prices. The measures taken by the Government restricting exportation failed to prevent further advance in local wholesale prices. An investigation showed

that the margin was in favor of export trade. Retailers claimed that the "average cost of running a retail grocery business was 12½ per cent on the turnover," and that they were handling butter at a loss.

After an exhaustive investigation the board came to the conclusion that the retail price should not be allowed to rise indefinitely and recommended a fixed price throughout New Zealand; the prohibition of export of butter and cheese, except under license on certain terms and conditions; fixed maximum wholesale price, from time to time, for butter for local consumption, and limiting distribution charges.

The board prepared a scheme in consonance with the above recommendations. This was approved by the Government, and on October 13, 1916, regulations were gazetted. The validity of this action was tested in the Supreme Court, which declared the "Order in Council to be valid in all respects." The fund derived from licenses "shall be returned to the contributing factories," less expenses of administration. The scheme is said to be working satisfactorily.

The investigation of the meat supply showed a gradual change in the proportion of each kind of beef slaughtered. The following table shows this variation by years, 1913 to 1917, at the Auckland abattoirs:

Beef animals slaughtered.	1913-14	1914-15	1915-16	1916-17 ¹

Total.....	17, 331	16, 944	14, 474	8, 099

¹ April to October, 7 months.

For the first and the last full year, the percentages of cows to all slaughtered beef cattle were 24.3 and 46.1, respectively. In one locality for the year ending March 31, 1916, 90 per cent of all sheep and lambs slaughtered were ewes.

The prices of live stock (beef and mutton) had increased over 100 per cent between January, 1912, and March, 1917. During this period prime oxen increased from 23s. (\$5.60) to 46s. 6d. (\$11.31); cow beef, from 20s. 6d. (\$4.99) to 43s. 9d. (\$10.65); and sheep, from 17s. 3d. (\$4.20) to 34s. 9d. (\$8.46) per 100 pounds.

In a few cities arrangements were made by which butchers could be supplied from the imperial store subject to their selling meat at prices deemed reasonable by the board. In other cities agreements have been reached on a price list. At Auckland two retail shops were taken over, at the offer of the owner, by the New Zealand Gov-

ernment. The owner and employees were retained, and a civil service accountant supervises the accounts. One effect directly traceable to the establishment of Government meat shops in Auckland was the steadying of retail prices throughout New Zealand. The upward tendency was checked and in Auckland an actual reduction took place.

While the sugar company possesses a monopoly of the New Zealand sugar trade, it did not make use of its economic position and the conditions created by the war to exploit the public.

Milk, fish, kerosene, coal, etc., prices are among the other items of consumption which came within the purview of the board, and are the subjects of discussion in the report.

WAGES AND HOURS OF LABOR.

RATES OF WAGES OF EMPLOYEES PLACED BY FEDERAL, STATE, AND MUNICIPAL EMPLOYMENT OFFICES, DECEMBER, 1917.

In the following table are shown the prevailing rates of wages paid to workers in 33 selected occupations placed in employment by public employment offices on the last day of December, 1917, or the day nearest the last day in December on which workers were placed. Reports from 89 employment offices from 39 States and the District of Columbia were tabulated as follows: Thirty-five Federal employment offices, 1 Federal-municipal employment office, 9 Federal-State employment offices, 1 Federal-State-municipal employment office, 2 municipal employment offices, 1 municipal-private employment office, 38 State employment offices, and 2 State-municipal employment offices.

124 MONTHLY REVIEW OF THE BUREAU OF LABOR STATISTICS.

WAGES AND HOURS OF LABOR IN THE IRON AND STEEL INDUSTRY.

This bureau has just published a report (Bulletin 218) which is a continuation of its former reports on wages and hours of labor in the iron and steel industry. This statistical record ends with May, 1915, a time when the late general depression in the industry was lessening, but at a time when hourly earnings still were at a low level. The depression while not affecting the rates of pay which had been materially increased in the spring of 1913, did, by affecting the tonnage output and consequently the incentive for rapid work, so decrease the earnings per hour of tonnage workers, that the combined full-time weekly earnings of time and tonnage workers in May, 1915, as compared with May, 1913, were decreased 4 per cent in blast furnaces, 10 per cent in Bessemer plants, 1 per cent in open-hearth plants, 5 per cent in blooming mills, 3 per cent in standard rail mills, 4 per cent in bar mills, and 5 per cent in sheet mills. The weekly earnings in plate mills were unchanged and tin-plate mills showed an increase of 3 per cent.

In addition to the regular tables showing wages and hours of labor a complete presentation is made in this report, by percentages, of the turns worked and the amounts of pay rolls, in the ten departments of the industry discussed, during each month of the two-year period ending June, 1915, which covers the greater part of the general depression. These monthly statements clearly show the increasing activity in the several departments from January to June, 1915, while other text and tabular statements exhibit the remarkable increases in employment and in rates of pay and earnings in the iron and steel industry between January, 1915, and January, 1917. In the latter period approximately 100 of the principal iron and steel plants of the country reported an increase in employees of over 50 per cent and in total pay rolls of over 125 per cent.

The reduction in seven-day work through the introduction of relief gangs which began in 1910 increased to such an extent that in blast furnace plants, the department in which operations are continuous, only 59 per cent of the employees worked seven days per week in 1915, as compared with 80 per cent in 1913, 95 per cent in 1910, and 97 per cent in 1907.

The wide range of average full-time weekly earnings in the iron and steel industry is shown by the following list, including a few

of the unskilled, semiskilled, and skilled occupations for 1915, selected from the various departments:

Blast furnaces:		Sheet mills:	
Laborers	\$12. 20	Openers	\$11. 93
Keepers	18. 33	Doublers	19. 42
Blowers	26. 93	Sheet heaters	37. 19
Bessemer converters:		Open hearth furnaces:	
Mold cappers	17. 53	Stockers	15. 41
Steel pourers	27. 96	Stopper setters	21. 96
Vesselmen	30. 87	Melters' helpers, first	32. 80
Blooming mills:		Standard rail mills:	
Bottom makers' helpers	12. 46	Hot-bed men	12. 54
Manipulators	25. 81	Table-lever men	22. 92
Heaters	40. 06	Rollers	43. 09
Plate mills:		Puddling mills:	
Shearmen's helpers	17. 89	Bloom boys	10. 62
Table operators, sheared	22. 63	Puddlers	20. 45
Screwmen, sheared	32. 61	Heaters	36. 37
Bar mills:		Tin-plate mills:	
Bundlers	13. 38	Screw boys	16. 59
Roughers	25. 76	Catchers	20. 87
Rollers	56. 75	Shearmen	29. 55

A similarity in earnings by no means indicates a similarity in full-time weekly hours; for example, it will be noticed that the full-time weekly earnings of blast furnace keepers were only \$1.09 less than those for sheet mill doublers, but the working time differed greatly in the two occupations, the average full-time hours per week of keepers being 79.4, while that of doublers was only 42.8.

The rate of wages paid common laborers is to a large extent a basic rate from which are determined the rates for other occupations requiring little skill, hence the rate for common labor is of importance beyond the limits of the occupation proper. The rate per hour is practically the same in all departments of a plant, but the earnings per day or week, of course, are determined by the number of hours worked. The average rate per hour of laborers in 1915 in the 10 departments covered by this report was 18 cents while the average full-time hours per week ranged from 57.5 to 74.3, and the average full-time weekly earnings from \$9.66 to \$14.31.

A valuable addition to this report is a glossary of iron and steel occupational terms, covering not only the principal occupations but many of the minor ones as well. The glossary will be of great service in any study of labor conditions in the iron and steel industry.

MINIMUM WAGE.

RESULTS OF MINIMUM-WAGE LEGISLATION IN CALIFORNIA CANNING INDUSTRY.

In May, 1917, the California Industrial Welfare Commission issued a report (Bulletin No. 1) on the regulation of wages, hours, and working conditions of women and minors in the fruit and vegetable canning industry of the State,¹ which is devoted largely to a study of the effects of certain rulings of the commission on the industry during the season of 1916. These rulings, or orders, established sanitary standards, hours of labor, and minimum piece rates for canning and cutting apricots, peaches, pears and tomatoes, and time rates applicable to any occupation.² The portions of these orders relating to wages and hours of labor are given in full:

No person, firm, or corporation shall employ or suffer or permit any woman or minor to work in the fruit and vegetable canning industry in any of the following occupations at piecework rates less than the following:³

Piece rates.

Cutting:

Apricots.....	\$0.225 per 100 pounds.
Pears	.375 per 100 pounds.
Cling peaches.....	.225 per 100 pounds.
Free peaches.....	.125 per 100 pounds.
Tomatoes.....	.03 per 12 quarts.

Canning:

All varieties of fruit, No. 2½ cans	.015 per dozen cans.
All varieties of fruit, No. 10 cans.....	.036 per dozen cans.
Tomatoes, No. 2½ cans	.01 per dozen cans.
Tomatoes, No. 10 cans.....	.024 per dozen cans.

Time rates.

Experienced hands, (that is, experience of over three weeks).....	.16 per hour.
Inexperienced hands	.13 per hour.

¹ California. Industrial Welfare Commission. Bulletin No. 1. Report on the regulation of wages, hours, and working conditions of women and minors in the fruit and vegetable canning industry of California, Sacramento, 1917. 176 pp. Illustrated.

² The wages board in the fruit and vegetable canning industry, upon whose recommendation the piece rates established by the commission were based, after slight modification, devoted its attention primarily to the matter of piece rates because over 90 per cent of the women employed in the industry work on this basis. The piece rates were made to apply only to apricots, peaches, pears, and tomatoes, because "they constitute 80 per cent of the fruit and vegetable pack of the State."

³ It should be stated in this connection that these orders have been superseded by orders of Apr. 16, 1917, effective June 16, 1917, applicable to the 1917 pack. See MONTHLY REVIEW for July, 1917, pp. 57 and 58.

No person, firm, or corporation shall employ or suffer or permit an adult woman, 18 years of age or over, to work in the fruit and vegetable canning industry for more than 10 hours in any one day, or more than 60 hours in any one week, except in case of emergency; provided, however, that in no case shall the hours of employment of any woman exceed 72 hours in any one week * * *

No person, firm, or corporation shall employ or suffer or permit any adult woman, 18 years of age or over, to work in case of emergency at a wage less than one and one-fourth times the foregoing minimum time or piece rates. Emergency work shall be all work performed by any woman in excess of 10 hours in any one day, or all work performed by any woman or minor in excess of 6 calendar days in any one week.

No person, firm, or corporation shall employ or suffer or permit any minor child, under the age of 18 years, to work in the fruit and vegetable canning industry for more than 8 hours in any one day or more than 48 hours in any one week.

The 1916 pack of fruit and vegetables was the largest in the history of the State, the output being 7,000,000 cases of fruit and 4,000,000 cases of vegetables, valued at approximately \$25,000,000. The 101 canneries operating employed upwards of 22,000 women and children and nearly half as many men, the largest number of women employed at any one time being 12,000. The industry, of course, is highly seasonal in character, the average time for 62 establishments being 18.9 weeks. The question of labor turnover appears to be a very serious one for the report states that in city canneries 20 per cent of the women stayed less than one week and 40 per cent stayed less than 4 weeks. This of course means low earnings for the women, and confusion, inefficiency, and lessened profits for the management. What is characterized as "un-American standards of labor" have grown up in the industry in the past due largely to the fact that a great deal of immigrant labor has been employed, so that the task of the industrial welfare commission has been to overcome these abuses and establish American standards.

The problem of child labor seems to be solving itself, since employers have found that it does not pay. In 41 canneries in 1916 only 1,092 children were working, as compared with 2,344 children employed in the same canneries in 1914—a reduction of 53.4 per cent in 2 years. Many establishments employ no children under 16 years of age, and the largest city canneries in San Francisco and Los Angeles employ practically none under 18 years of age.

The report seems to refute the claim made by some that "the minimum will become the maximum," for it is shown that the rulings of the commission resulted in raising even higher than the minimum the piece rates payable to workers. Thus, it appears that of apricots 43.6 per cent were packed at rates higher than the minimum; of free peaches, 27.6 per cent; of cling peaches, 17.8 per cent; of

pears, 11.7 per cent; and of tomatoes, 3.9 per cent. Nor was the objection that piece rates already higher than the established minimum would be reduced to the fixed rates found to be valid; for in 50 instances, on the five products, rates higher than the minimum rates were paid in 1915, and in only one instance was a reduction made to meet the minimum rates.

The following table, compiled from the report, shows the number of canneries scheduled, the range of rates paid for the preparation of each specified article in 1915 and 1916, and the total wages paid in 1916 together with the total wages that would have been paid had all factories maintained the 1915 rates:

COMPARISON OF RATES PAID IN 1915 AND 1916 FOR PREPARATION OF EACH SPECIFIED PRODUCT, SHOWING TOTAL WAGES PAID IN 1916 AND TOTAL THAT WOULD HAVE BEEN PAID HAD THE 1915 RATES BEEN MAINTAINED IN ALL FACTORIES.

Product.	Number of canneries.	Minimum rate per 100 pounds.		Wage cost of preparation in 1916.			Per cent of 1916 pack payable at—		Number of canneries paying more than minimum rate.	
		1915	1916	At 1916 rates.	At 1915 rates.	Per cent of increase	Minimum rate.	Higher than minimum rate.	1915	1916
		<i>Cents.</i>	<i>Cents.</i>							
Cling peaches.....	54	15 to 28.6	22.5 to 31.2	\$211,086.60	\$197,716.66	6.8	82.2	17.8	7	11
Pears.....	32	31.3 to 50	37.5 to 50	163,316.92	159,286.85	2.5	88.3	11.7	5	7
Apricots.....	51	15 to 37.5	22.5 to 37.5	90,103.00	81,903.17	9.1	56.4	43.6	16	27
Tomatoes.....	31	12.5 to 4.0	13.0 to 4.0	88,761.02	86,011.31	3.2	96.1	3.9	4	6
Free peaches.....	46	10 to 17.8	12.5 to 16.7	38,471.44	38,634.54	(²)	72.4	27.6	18	20

¹ Per 12 quarts.

² Decrease; less than one one-hundredth of 1 per cent.

One portion of the report considers the matter of the yielding power of piece rates established by the commission, in which it is shown that the hourly production of workers under the new 1916 piece rates was increased sufficiently to raise the average minimum hourly earnings considerably over the average minimum hourly earnings which it had been determined could be made based upon the hourly production under the piece rates formerly in force. For example, take the case of cling peaches. At the minimum rate of 22.5 cents per 100 pounds, it was found that hourly production should equal 71.1 pounds in order to yield an average wage of 16 cents an hour. Under the new rates the total average hourly production was found to be 90.3 pounds, which is equivalent to average hourly earnings of 20.9 cents, or 4.9 cents above the minimum hourly wages established by the commission. This condition was found to exist also in canneries handling pears, free peaches, and tomatoes, but not in canneries handling apricots, where the total average hourly

earnings, under the new piece rates, amounted to only 13.7 cents, or 2.3 cents below the 16-cent minimum.

The report also includes a statement of production in the products on which no minimum piece rates had been fixed, comprising asparagus, cherries, apples, string beans, spinach, berries, pimentos, beets, quinces, onions, chilis, plums, grapes, maraschino cherries, peas, and cling and free peaches (hand peeled), showing that the average hourly earnings of workers in these products were lower than in the products produced under the established rates. In a chapter on average hourly earnings, certain factors which operated to increase or decrease production and earnings are noted and explained, among these being (1) the principal product of the cannery; (2) the district, in relation to the principal product; (3) the proportion of minors employed; (4) the length of the season; (5) the turnover in labor force; (6) the length of hours worked. A summary of the factors of production is presented in a table detailed by districts, the following being a recapitulation covering 62 canneries in the State:

Number of canneries-----	62
Average hourly earnings of workers (cents)-----	18.1
Average length of season (weeks)-----	18.9
Total number of adults employed-----	18,150
Total number of minors employed-----	1,711
Total number employed-----	19,861
Per cent of minors to total employed-----	8.6
Number employed the entire season-----	2,964
Per cent of total-----	14.9
Total number of woman hours worked during the season -----	5,937,706
Number of weeks cutters exceeded 60 hours-----	127
Number of weeks cutters worked 48 to 60 hours----	279
Number of weeks cutters worked less than 48 hours--	525
Number of weeks canners exceeded 60 hours-----	224
Number of weeks canners worked 48 to 60 hours-----	250
Number of weeks canners worked less than 48 hours--	399

The hours worked in most canneries are said to be very irregular, but, it is added, they have been gradually reduced from year to year, because the canneries "have learned what other lines of industry have learned, that excessive hours of work are not efficient from the viewpoint of output, to say nothing of the consideration of the welfare of the workers. The length of day now depends largely upon the class of women employed and the type of management." A table is given showing that 45.2 per cent of the canners and 55.9 per cent of the cutters worked less than 48 hours per week. The seasonal nature of the work is best illustrated by the fact that 55.5

per cent of the total pack was handled within a period of eight weeks.

As to the effect of the commission's rulings on sanitation, the report gives a comparative statement of the conditions in certain factories in 1915 and 1916, showing marked improvements in provision for the comfort and health of the workers.

The report closes with a preliminary report on the possibility or practicability of providing seats for women while at work, in which the investigator states the conclusion that "there is no good reason why compulsory standing or compulsory sitting on the part of women cannery workers should not soon be a thing of the past. There is no question but that a free choice of position on the part of the worker and the shortening of the motions required on her part will reduce fatigue and hence increase output."

WAGES, HOURS, AND WORKING CONDITIONS OF WOMEN IN LAUNDRIES AND STORES IN KANSAS.¹

The creation of the Kansas Industrial Welfare Commission was authorized by legislative enactment approved March 6, 1915, effective July 1 following, and consists of the commissioner of labor and two others appointed by the governor. The law creating the commission provides—

That it shall be unlawful to employ women, learners, and apprentices and minors in any industry or occupation within the State of Kansas under conditions of labor detrimental to their health or welfare, and it shall be unlawful to employ women, learners, and apprentices and minors in any industry within the State of Kansas at wages which are not adequate for their maintenance and for more hours in any one day than is consonant with their health and welfare.

The law further provides that if after any investigation the commission is of the opinion that wages, hours, sanitary or other conditions need regulating, it may, upon recommendation through a board made up of representatives of employers of the occupation in question, representatives of employees, and one or more of the disinterested public, make and render such orders as may be proper and necessary to carry out the recommendation and determinations of the board. The act thus authorizes the commission to establish a minimum wage and determine the hours for female workers. The report states that in the hope of remedying the working conditions of the greatest number of women workers the commission directed

¹ Kansas. Industrial welfare commission. First biennial report. From July 1, 1915, to June 30, 1917. Topeka, 1917. 65 pp.

its efforts first to an investigation of the laundry and mercantile industries.

Of 780 women workers in 85 laundries, the commission found that 27.2 per cent received less than \$6 per week, 50.1 per cent received \$6 but under \$8, while only 15.3 per cent received \$8 but under \$10, and 7.4 per cent received \$10 or more per week. The hours worked by 517 (66.3 per cent) of these women were found to be 9 but under 10, while 227 (29.1 per cent) were required to work 10 hours or over. Only 102 (13.1 per cent) were working under 48 hours per week, while 54 (6.9 per cent) were working 60 hours and over per week. Referring to a group of workers, the number not being given in the report, it is shown that 73.1 per cent received less than \$6 per week; that length of time which they worked for the same firm has not had much influence on their wages; that 25 per cent had finished the eighth grade in school, while 45 per cent had not finished the sixth grade; that 64.7 per cent lived at home; that 61.5 per cent were giving assistance to or entirely supporting their families; that 46 per cent remained with the same firm less than one year; and that 94.1 per cent worked 9 hours or longer each day.

Two sets of figures are presented covering the conditions of women workers in mercantile establishments, those collected by the Department of Labor and those gathered by the welfare commission. Referring to the latter figures, of 1,625 women from whom data as to earnings were obtained, 26 per cent received less than \$6 per week, 43 per cent received less than \$7 per week, and 53.7 per cent received less than \$8 per week, while 1,481, or 91.1 per cent, worked 9 hours but under 10 per day, and 121, or 7.4 per cent, worked under 9 hours. The Department of Labor figures reveal a somewhat better condition. Of 1,552 workers, 238, or 15.3 per cent, received under \$6 per week; 487, or 31.4 per cent, received less than \$7 per week; and 683, or 44 per cent, received under \$8 per week; while all the workers recorded worked 9 hours and over per day.

In a group of mercantile workers the welfare commission found that 41.1 per cent had finished the 8th grade in school, that 47 per cent were entirely self-supporting, and that 28.7 per cent had remained with the same firm less than one year. About 35 per cent had been with the same firm over 5 years.

Affecting both the laundry and mercantile workers, the welfare commission has approved the recommendations of the respective boards as to hours of labor as follows:

For laundry workers: Nine hours shall constitute a regular day's work for female laborers in laundries in this State; and no female person shall be required to work more than 10 hours in any one day, not more than 54 hours in any one week.

For mercantile workers: No female person shall be employed in any mercantile establishment in the State of Kansas except during 10 consecutive hours of any day of 24 hours, and for not more than 9 hours during the said 10 hours; and for not more than 6 days during each week; and no female person shall be employed later than 9 o'clock at night in any one day.

It does not appear from the report that minimum wages have been established by the commission. The commission has, however, approved the establishment of a sanitary code for each industry, the following for the mercantile workers being typical:

No person, firm, or corporation subject to chapter 275 of the session laws of 1915 shall employ or permit any female person to work in any mercantile establishment in the State of Kansas in which the conditions do not conform to the following standards:

1. Cleanliness: Every room and the floors, walls, ceilings, windows, and every other part thereof, and all fixtures therein, shall at all times be kept in a clean and sanitary condition.

2. Drinking water: A sufficient quantity of safe, fresh drinking water, within reasonable access to all workers, shall be provided, with sanitary appliances for drinking. A common drinking cup shall not be used. When the water is iced the ice shall not be in the same container as the water.

3. Lighting: All rooms shall be properly and adequately lighted during working hours. Artificial illumination in every work room shall be installed, arranged, and used, so that the light furnished will at all times be sufficient and adequate for the work carried on therein, and prevent unnecessary strain on the vision or glare on the eyes of the worker.

4. Ventilation: The ventilation of each room shall be adequate, and there shall be sufficient provision for preventing excessive humidity, and an amount of cubic air space necessary to health must be allowed for each employee.

5. Toilet rooms: In every establishment there shall be provided suitable and convenient toilets, separate from those used by the opposite sex, and the number of such toilets shall be not less than one to every 20 female persons employed at one time, or majority fraction thereof. Such toilets must be thoroughly ventilated and open to the outside air, and such toilets must, at all times, be kept in a clean and sanitary condition.

6. Wash rooms: Wash-room accommodations, separate and apart from those used by male persons, must be provided, and individual towels, either cloth or paper, must be furnished. The washing facilities must be adequate, and the wash rooms must be kept in a clean and sanitary condition.

7. Dressing rooms: A suitable space, effectively screened, must be provided for female persons to change their street clothes for working clothes, and, where practical, individual lockers should be provided. A cot for emergency purposes shall be provided.

8. Where there are less than four female persons employed by any person the industrial welfare commission may, upon application and showing, release each applicant from compliance with the foregoing regulations or any part of same.

The commission made some investigation of the cost of living of these workers, the result being set forth in the following table:

ESTIMATED COST OF LIVING MADE BY WOMEN WORKERS IN MERCANTILE ESTABLISHMENTS AND LAUNDRIES IN KANSAS.

Item.	Mercantile establishments.		Laundries.	
	Weekly.	Annually.	Weekly.	Annually.
Board and room.....	\$5.01	\$260.65	\$4.64	\$240.80
Clothing.....	2.08	108.07	1.19	62.00
Books, papers, magazines, amusements, vacations.....	.61	31.87	.26	13.74
Laundry.....	.53	27.77	.27	14.05
Total.....	8.23	428.36	6.36	330.59

With a total annual living expense of \$330.59 for laundry workers, and of \$428.36 for mercantile workers, it can be seen that a weekly wage even of \$8 would leave very little surplus for the former and a deficit for the latter. Of course, as has been stated, most of the girls live at home, thus probably reducing their expenses for board and room, so that a minimum wage of \$8 per week would leave a larger surplus than is apparent from the table.

CHILD LABOR.

PRESIDENT'S POSITION ON SAFEGUARDING OF WOMAN AND CHILD LABOR.

The following statement has been made by the President in a letter to the chairman of the National Child Labor Committee under date of December 20, 1917, in regard to the safeguarding of woman and child labor:¹

As the labor situation created by the war develops, I am more interested than ever, if that were possible, in throwing all the safeguards possible around the labor of women and children in order that no intolerable or injurious burden may be placed upon them. I am, therefore, very glad indeed that the National Child Labor Committee is diligently continuing its labors and extending its vigilance in this important matter. By doing so it is contributing to efficiency and economy of production, as well as to the preservation of life and health.

CHILDREN LEAVING SCHOOL TO GO TO WORK IN WALTHAM, MASS.

The United States Children's Bureau has recently issued a report² presenting the result of a study of children leaving school under 16 years of age to go to work in Waltham, Mass., an industrial community of about 30,000 inhabitants. Although the study was made in October and November, 1914, it is stated that no material change has occurred in the manner in which children are prepared for industry and commercial occupations in Waltham and the conclusions as to such preparation are therefore substantially valid as applied to present conditions. Information was obtained concerning 200, or 40 per cent of the 500 literate³ children between the ages of 14 and

¹ Official Bulletin, Jan. 2, 1918, p. 4.

² From School to Work: A study of children leaving school under 16 years of age to go to work in Waltham, Mass., an industrial community of about 30,000 inhabitants, by Margaret Hutton Abels. United States Department of Labor, Children's Bureau. Washington, 1917. 59 pp.

³ The report states that illiterate children are those who can not read, write, and spell in the English language, in accordance with the requirements for the completion of the fourth grade of the public schools. Under the law which was in force until September 1, 1913, illiterate children over 14 years of age could be employed provided they were regular attendants at public evening schools. Under the law (Acts of 1913, ch. 779) which went into effect September 1, 1913, however, illiterate children under 16 can not obtain employment certificates. This inquiry covers a period during which both of these laws were in effect.

16 years who took out their first employment certificates during the period from September 1, 1911, to October 31, 1914, their ages, therefore, at the time of the inquiry ranging from 14 to 19 years. The data gathered includes facts as to the age, sex, nativity, the living conditions of working children in Waltham; reasons why the children leave school, where they work, what occupations they enter, the conditions under which they work, what wages they earn, how steadily they are employed, and what opportunities they have for advancement. Over four-fifths of the children studied were native Americans, and 59 per cent were born in Waltham; 95 per cent were living with their parents or other relatives.

The following excerpts taken from the report indicate the provisions of law covering the employment of children in Massachusetts:

Under the laws of Massachusetts every child between 14 and 16 years of age must attend school, unless he has received an employment certificate and is engaged in some regular employment or business for at least six hours a day, or has the written permission of the superintendent of schools to engage in profitable employment at home, or is mentally or physically unfit to attend school. No child may be employed in any factory, workshop, or manufacturing, mechanical, or mercantile establishment unless the employer procures and keeps on file an employment certificate, except that children may work in mercantile establishments on Saturdays between 7 a. m. and 6 p. m. without certificates.

The older group of minors, those between 16 and 21 years of age, may not work in factories, workshops, or manufacturing, mechanical, or mercantile establishments without educational certificates. These certificates are intended to enforce the attendance upon evening schools of illiterate minors—that is, children who can not read, write, and spell in the English language in accordance with the requirements for the completion of the fourth grade of the public schools. Illiterate children must attend public evening schools, if such are established in the city or town in which they reside, for the whole time during which the public evening schools are in session.

The most remarkable initial fact brought out by the study was the marked decrease in the number of children under 16 years of age granted employment certificates, and also the decrease in the proportion of children granted employment certificates immediately upon passing the compulsory school age. During the year ending March 31, 1913, under the old law, employment certificates were issued to 215¹ children (118 boys and 97 girls), while under the new law during the year ending March 31, 1915, employment certificates were issued to 106 children (79 boys and 27 girls), a decrease of 50.7 per cent. In the first period, of the total number of children to whom employment certificates were issued, about two-thirds (143, or 66.5 per cent) were between 14 and 15 years of age, and in the second

¹ These figures are not the result of the investigation, but are taken from the annual reports of the Waltham school board for 1913 and 1915, and from records of home permits in the office of the superintendent of schools.

period only a little more than one-third (38, or 35.8 per cent) were between these ages. Of 168 children between the ages of 13 and 16 years, for whom data were obtained, 39.3 per cent left school between the ages of 14 and 14½ years, and 63.1 per cent left school between the ages of 14 and 15 years.

The report states that the reasons for leaving school to go to work most commonly given by the children were those indicating a lack of adjustment between the school and the child. For example, 50 per cent of the children gave such reasons as dislike of school, backwardness in school, or trouble with the teachers. Over one-third (34.5 per cent) gave economic necessity as their primary reason; about one-tenth (10.7 per cent) gave preference for work as their first reason; 4.8 per cent stated that it was their parents' wish that they leave school. "This showing as to the large proportion of children who go to work in Waltham because their families need their earnings, agrees with the findings in the Commonwealth at large and in other communities where child labor has been investigated." Yet, the report states that in some cases the need was not so apparent since it is possible that the idle adult wage earner would not have been idle if the children had not been contributing to the family's income. Only about one-third (32.1 per cent) of the children who gave economic need as the reason for leaving school and reporting the amount of their initial wages, received \$5 or more a week in their first employment; 35.7 per cent received \$4 to \$4.99 a week, and 32.1 per cent received less than \$4 a week.

Taking up the school reasons given by 50 per cent of the children, it appears that 17.9 per cent of the 168 reporting left school because of backwardness in their studies, and 32.2 per cent left because of dislike for school or trouble with their teachers. The extent of retardation¹ of these pupils is indicated in the following table which also gives the school standing of 442 children of the same ages in the public schools of Waltham in September, 1914.

¹ The standard of retardation in this report is determined by the assumption that children who are 6 and 7 years of age in the first grade, 7 or 8 years of age in the second grade, 8 or 9 years of age in the third grade, and so on, are called normal.

SCHOOL STANDING OF REGULAR WORKERS WHO LEFT SCHOOL TO GO TO WORK
COMPARED WITH THAT OF PUPILS IN SCHOOL IN SEPTEMBER, 1914.

School standing.	Regular workers who finally left school at 14 but under 16 years of age.		Children 14 but under 16 years of age in public schools September, 1914.	
	Number.	Per cent.	Number.	Per cent.
In advance of normal grade.....	2	1.3	54	12.2
In normal grade.....	26	17.0	225	50.9
Retarded:				
1 year.....	31	20.3	69	15.6
2 years.....	31	20.3	41	9.3
3 years.....	30	19.6	21	4.8
4 years.....	18	11.8	17	3.8
5 years.....	11	7.2	13	2.9
6 years.....	4	2.6	2	.5
Total retarded.....	125	81.7	163	36.9
Grand total.....	¹ 153	100.0	442	100.0

¹ Of the 206 children studied 32 were vacation workers and were still in school, 2 did not report the last grade attended, 6 left school between 13 and 14 years of age, and 7 had returned to school after working and finally left school at 16 and 17 years of age.

This table shows that retardation in school was much more general among the children between 14 and 16 years of age who left school to go to work than among the children of the same ages attending the public schools in 1914. Of the former group 81.7 per cent were retarded; of the latter, 36.9 per cent.

It seems that most of the children who left school (65 per cent) entered manufacturing establishments, while 13.5 per cent entered mercantile establishments, but it is noted in this connection that at the time of the inquiry there had been many changes of positions so that at that time only 55 per cent, a decrease of 15.4 per cent, were employed in manufacturing establishments, while 18 per cent, an increase of 33.3 per cent, were employed in mercantile establishments. The proportion of employment certificates issued for work in manufacturing establishments decreased from 81.9 per cent in 1913 to 55.2 in 1915, while the proportion of employment certificates issued for work in mercantile establishments increased from 4.2 per cent in 1913 to 10.5 per cent in 1915.

The chief reason for this change is the law prohibiting the employment of children under 16 years of age for more than eight hours a day. Children under 16 years of age in factories appear to have been gradually replaced by older children, who are not subject to the eight-hour law.

A striking fact brought out in the analysis of the wages received by these working children is that those who left school as soon as they had reached the age of 14 years received lower initial wages and advanced more slowly than those who remained in school until they were 15 or 16. It is stated that for all the children who reported initial and latest wages and ages at the time of beginning work, in-

cluding those whose latest wages were the same or lower than their initial wages, the average annual rate of increase in weekly wages¹ was \$1.13, and that those children who began work at 14, but under 14½ years of age, received an average annual rate of increase in their weekly wages of 92 cents, as compared with the following rates for those who began work at more advanced ages: Ninety-six cents for those who began at 14½ but under 15; \$1.12 for those who began at 15 but under 15½ years; and \$1.92 for those who began at 15½ but under 16 years. There was a similar marked tendency among those whose latest wages were greater than their initial wages. It is noted that the length of time these children were at work was a less important factor in the increase of wages than the age at which the children began work. These facts are brought out in the following table:

AVERAGE WEEKLY WAGES AND AVERAGE RATE OF INCREASE PER YEAR ^a IN WEEKLY WAGES RECEIVED BY CHILDREN ^b OF EACH SPECIFIED AGE AT THE TIME OF BEGINNING WORK, AND AVERAGE NUMBER OF MONTHS CHILDREN HAD BEEN AT WORK.

Age at time of beginning work.	All children.				Children whose latest wages were greater than their initial wages.			
	Num-ber.	Aver-age num-ber of months at work. ^c	Aver-age weekly wages.	Aver-age rate of in-crease per year in weekly wages.	Num-ber.	Per-cent all chil-dren.	Aver-age num-ber of months at work.	Aver-age rate of in-crease per year in weekly wages.

^a See footnote below.

^b Children who reported initial and latest wages and age at the time of beginning work.

^c Including time idle between jobs.

A table is given in the report showing that most of the children (75.8 per cent) turned their entire earnings into the family pocket-book.

Other points developed by the inquiry are summarized in the report as follows:

Slack work accounted for 30.6 per cent of the cases of leaving jobs for which the reasons of leaving were reported, while 21.2 per cent of the changes were due to dissatisfaction with work. Other reasons for terminating employment reported by the children were: Return to school (12.1 per cent), securing better job (9.4 per cent), physical disability (8.1 per cent), discharge as a result of

¹ The report states that this was computed by dividing the amount of increase in weekly wages by the number of months elapsed between the date of beginning work and the date of visit, if child was still employed, or the date of termination of last job if child was idle at date of visit, and multiplying the quotient by 12.

the child-labor law of 1913 (6.4 per cent), disagreement with others, discharge, and miscellaneous reasons (12.1 per cent).

Eleven and five-tenths per cent of the children were neither working nor in school at the time of the inquiry. The prospect for the large majority of the children was unsteady work, in monotonous occupations, with little opportunity to increase their earnings.

No special training for the occupations which they entered had been received by any of these children in the public schools.

The law limiting the hours of labor of children under 16 years of age to eight a day was apparently obeyed by most Waltham employers. The legal provision requiring the return of employment certificates within two days after the cessation of work by the child was not well observed.

The study here outlined seems to show that children in Waltham who leave school between 14 and 16 years of age are not adapted to industry, and only in the few cases where the workers are "learning the business" does industry make the necessary adaptation to the child. It is apparent that if anything is to be done for the children who are working or for those who may be compelled to work before reaching the age of 16 years, it must be done by the public schools. Proceeding on this basis the report suggests that, pending a more complete study of the industries and of the schools, an important step toward the solution of the problems of child labor, vocational guidance, and vocational education in Waltham, would be to secure a trained vocational adviser who would give his full time to the work.

Such an officer would study the industries of the community, secure the co-operation of employers, and map out a plan for vocational education which would be adapted to the needs of Waltham children. A vocational adviser would also study the children who are desirous of leaving school to go to work, their home problems and their ambitions, and suggest more schooling or a different kind of schooling, or advise in regard to their choice of employment, and assist them in finding suitable positions. In addition to giving vocational advice, such an officer might well be given the duties of issuing and checking up all employment certificates and compiling statistics of juvenile labor.

The report suggests a list of occupations in which 37 boys and 17 girls expressed a desire for training, but adds that 59 per cent of those interviewed thought that they would not take advantage of vocational training if it were offered.

RELATION BETWEEN JUVENILE DELINQUENCY AND JUVENILE EMPLOYMENT.

In England the war has brought about a considerable relaxation of the rules concerning school attendance and the employment of children. England has also seen a considerable increase in juvenile delinquency since the outbreak of the war. No one supposes that

this is due entirely to the increase in juvenile employment, but there is generally believed to be a connection between the two. When, therefore, as an immediate consequence of the entrance of the United States into the war, there was a demand for the suspension or modification of the laws restricting the employment of women and children, the national child labor committee felt that it was desirable to see whether any conclusion could safely be drawn as to the probable effect of such a relaxation upon the problem of juvenile delinquency:

It has seemed wise to the national child labor committee, as one of its measures of child protection during the war, to begin a series of studies in various juvenile courts and reformatories over the country for the purpose of assembling all possible information on the relationship between juvenile delinquency and employment.

The results of the first of these investigations have recently been published.¹ Based upon the records of the Manhattan branch of the children's court, it deals with 1,792 children, 1,628 boys and 164 girls, aged 7 but under 16 years, who passed through this court in 1916. No children were included who were brought in merely for investigation, or who presented really cases of improper guardianship rather than of delinquency, or who were so mentally defective as to require commitment to custodial institutions, or who were acquitted or discharged after trial. Everyone of those studied had been not only accused but convicted of some real offense against State law or city ordinance.

The first conclusion appearing from the data presented is that working children are unduly numerous among these offenders. Of the boys 614, or 37.7 per cent, and of the girls 68, or 41.5 per cent, had been employed previously to their arrest. As nearly as could be estimated not more than 10 per cent of the children between 7 and 16, resident in the borough of Manhattan, were employed during 1916.

On this basis the working children contribute four times their share to the ranks of juvenile delinquency. Should we double our estimate of the number of working children, they would still be sending twice their due proportion to the court.

There is a great difference, however, in the character of the offenses charged against these children, and it might be possible that the working children, while furnishing more than their proportionate share of culprits, were responsible for the more trivial delinquencies. To test this, seven offenses were selected as being the most serious; for these the numbers of working and nonworking offenders were as follows:

¹ The Child Labor Bulletin, 105 E. 22d St., New York City, November, 1917, pp. 161-200.

NUMBER OF WORKING AND OF NONWORKING CHILDREN COMMITTING THE MORE SERIOUS OFFENSES.

Offense.	Working.		Nonworking.		Total.
	Boys.	Girls.	Boys.	Girls.	
Arson.....	2		3	1	6
Assault.....	36		54		90
Disorderly conduct.....	77	4	200		281
Drug selling.....	3		1		4
Drunkenness.....	2	1	3		6
Forgery.....	1	2			3
Incorrigibility.....	111	25	192	22	350
Sex offenses.....	13	30	22	22	87
Theft.....	266	5	505	10	786
Other offenses.....	103	1	34	1	139
Total.....	614	68	1,014	56	1,752

That is to say, the working children, who are estimated to form approximately one-tenth of the population aged 7 but under 16, furnish not far from four-tenths (36.8 per cent) of the offenders charged with serious wrongdoing, while the nonworking nine-tenths furnish but a trifle over six-tenths of the serious offenders (63.2 per cent). The undue proportion from the ranks of the workers is about as apparent among those committing serious offenses as it is in the whole group.

Another important test is the prevalence of recidivism in the two classes, a matter which is felt to have a decided bearing upon the seriousness of a given offender's situation.

A child may yield to temptation once as the result of curiosity or thoughtlessness, but one court experience should forever damp his ardor for continued experiments with the law of the land. The recidivist, or repeating offender, is recognized by criminologists as the great problem in penal institutions, and the superintendents of juvenile reformatories know that the habit of transgression, once established, is broken with the utmost difficulty.

The following table shows the situation among the boys¹ in this respect:

RECIDIVISM AMONG WORKING AND NONWORKING BOYS.

Number of convictions on delinquency charge.	Number.			Per cent.	
	Work- ing.	Non- working.	Total.	Work- ing.	Non- working.
1.....	347	729	1,076	56.51	71.89
2.....	144	186	330	23.45	18.34
3.....	69	69	138	11.24	6.80
4.....	31	25	56	5.05	2.47
5.....	16	3	19	2.61	.30
6.....	6	1	7	.98	.10
7.....	1	1	2	.16	.10
Total.....	614	1,014	1,628	100.00	100.00

Percentage of recidivism among working boys..... 43
 Percentage of recidivism among nonworking boys..... 28

¹ Only 16 of the girls studied had made more than one appearance in court, a number too small to justify any conclusions.

The percentage of recidivism among the working boys is notably higher than among the nonworking, but even more striking is the difference in the proportion the two classes furnish to the total group of recidivists. Of the 552 recidivists, 48 per cent come from the working and 52 per cent from the nonworking boys.

In the proportion of offenders coming from their ranks, in the proportion committing serious offenses, and in the proportion of recidivists, the working children compare unfavorably with the nonworking. In order to see whether this difference can be accounted for by other circumstances than that of employment, the report considers several factors which might possibly be contributory, such as age, school grade completed, nationality (i. e., whether children of foreign or native born parents), and character of home. In none of these respects was there any striking dissimilarity between the two groups.

In other respects the findings of this report are much the same as those of other investigations into juvenile delinquency. Theft is the leading offense among the boys, accounting for 47 per cent of the total number of cases; incorrigibility and disorderly conduct stand next in order, accounting together for 35.6 per cent of the cases. The most numerous group, 241, or 39 per cent of the 614 boys at work, were delivery, errand, and wagon boys; newsboys come next with 146, or 23.8 per cent of the whole; 47 were employed in factories; 32 as street traders; 23 as office boys; 21 as bootblacks; and 21 in stores and markets, no other occupation showing as many as 10 enrolled. Cases in which there was a direct connection between the occupation and the offense were relatively most numerous in the small group, numbering nine, working in amusement resorts, six of these showing the direct connection; this, however, is accounted for by the fact that in most of these cases the fact that the child was employed in the place at all constituted the offense for which he was brought into court. Among the street traders direct-connection cases form 56 per cent, among the newsboys 33 per cent, among the delivery, errand, and wagon boys 23 per cent, and among the bootblacks 38 per cent of the total cases.

As a result of the study the investigators feel strongly that there should be no relaxation of the school attendance and child-labor laws.

It would be absurd to claim that all working children become delinquents, and there are undoubtedly individual cases where the shift from school to industry has proved the making of the boy, but in general the evidence is massed on the other side.

In view of the evidence brought out in this study that employment tends to delinquency, can the American people afford to run the risk of increasing juvenile delinquency now by demolishing labor laws and lowering the standards of compulsory education, thereby increasing the number of children employed? Must the children of the Nation carry, in this way as in many others, an undue share of the burden of war?

THE NEGRO IN INDUSTRY.

THE NEGRO MIGRANT IN PITTSBURGH.

An estimated increase in the Pittsburgh district during a period of little more than a year of 18,550 Negroes, of whom about 9,750 were workers, has presented a formidable problem in social economics, having an important bearing upon the lives of the Negroes themselves and the community in which they reside. A realization that this problem is primarily one relating to housing, rents, health, recreation and social conditions generally prompted an intensive study¹ in the summer of 1917 of the negro migrant in the hope of contributing "something toward the orientation and adjustment of the newcomers" that would "prove of value to those members of both races who have already seen in the migration new opportunity for a people whose need has been bitter, as well as a chance for manifold human service," and with the desire of "offering suggestions to those workers in other cities who are dealing with the same many-sided and baffling problem."

A most serious aspect of the problem was found to be the matter of housing. The report states that because of the high cost of materials and labor, incident to the war, and because of investment attractions other than in realty, but few houses have been built and practically no improvements have been made, the result being the employment of attics, cellars, storerooms, basements, churches, sheds, and warehouses for the accommodation of Negroes, and conditions that are confusing and shocking and that breed disease, crime, and vice. Data were secured from over 500 individuals. Of 465 Negroes, 50 per cent were found to be rooming and boarding, most of these being single men, and 35 per cent, mostly families, were living in tenements. As indicating the congestion existing, of 390 men without families 111 (28.5 per cent) were sleeping two in a room, 98 (25.1 per cent) 4 in a room, 61 (15.6 per cent) 3 in a room, and 57 (14.6 per cent) over 6 in a room, while only 22 (5.6 per cent) had individual bedrooms. Fifty per cent were sleeping two in a bed, and 13 per cent were sleeping 3 or more in a bed. Of 157 Negro families, 49 per cent were living in one room and 21 per cent in two rooms.

The rents paid in rooming houses by 305 roomers ranged from \$1.50 to more than \$3 per week, 55 per cent paying the lower figure and only 2.5 per cent paying over \$3. The board paid by 268 men

¹ The Negro Migrant in Pittsburgh, by Abraham Epstein. School of Economics, University of Pittsburgh. Pittsburgh, 1918. 75 pp. Illustrated.

ranged from \$2 per week to more than \$8 per week, the largest number, 77, or 28.7 per cent, paying \$6 per week. Rents paid by 142 families investigated ranged from \$10 to over \$25 per month, most of them (42.3 per cent) paying \$15 per month. It appears that for the accommodations provided, to say nothing of absence of conveniences, these rents are excessive.

The report makes the point that this great influx of Negro labor into Pittsburgh has not resulted in an over supply of labor, nor has it interfered with the opportunity of white labor. "Every man is needed, as there are more jobs than men to fill them. Pittsburgh's industrial life is for the time being dependent upon the Negro labor supply," but the migration has created a problem in housing that seems to be reflecting to the disadvantage of the Negro himself and of the community at large.

A comparison of working hours required of these migrants in the South and in Pittsburgh shows that while 51 per cent work 10 hours per day in the latter place, only 38 per cent had to work that many hours before leaving home; and that while 27 per cent were required to work less than 10 hours in the South, the percentage was only 16 in Pittsburgh. The wages received are generally higher in Pittsburgh than in the South, 56 per cent of the Negroes receiving less than \$2 a day before coming North while only 5 per cent were receiving less than that amount in their new field of labor. Sixty-two per cent were receiving \$2 to \$3 per day in Pittsburgh, while only 25 per cent were in this wage group in the South. However, 15 per cent received over \$3.60 per day in the South; and only 5 per cent were receiving more than \$3.60 in Pittsburgh.

Most of the Negroes gave as their reason for emigrating the fact that higher wages and economic opportunity had attracted them, while many thought that they would be better treated than at home. Failure, however, on the part of the city to provide decent homes in order to retain labor appears to be influencing the Negroes to move elsewhere, indicated by the statement that of 330 men only 92, or 27.9 per cent, said that they intended to remain in Pittsburgh.

Under the caption "The Negro's own problem," the report presents some facts as to the opportunities offered in Pittsburgh for the political, social, and economic advancement of the Negroes who have settled in the city. The survey indicates that the southern migrants are not as well established in the city's industries as the white laborers, about 95 per cent of those in the steel mills visited doing unskilled work and receiving wages of from 27½ cents to 33 cents per hour. Considerable prejudice against Negro workers was found to exist among white workers. The charge, however, that the Negroes were brought in to break up the labor movement does not appear to

be substantiated. "The number of Negroes taking the places of striking whites and of skilled white workers is so small that it is hardly appreciable." No effective effort seems to have been made to organize these unskilled laborers. They are admitted to membership in two unions and readily become good unionists, but the sentiment seems to be against their becoming members.

In presenting the community's problem the report takes up in some detail a study of delinquency among Negroes in Pittsburgh. Police station records show that the number of arrests on petty charges, such as suspicion, drunkenness, and disorderly conduct, etc., increased greatly in 1916-17 over 1914-15, while the graver crimes, as a whole, remained stable in spite of the increase in population and in some of the crimes which are usually credited to Negroes there is a marked decline. Most of those arrested were between 20 and 30 years of age and were unmarried.

The number of Negro charges in the juvenile courts during the first six months of 1917 was actually 23 lower, in spite of the increase of population, than during the corresponding period in 1915, the figures being 60 and 83, respectively. The author concludes "that the Negro migrant is not a vicious character; is not criminally and mischievously inclined per se, but on the other hand is a peaceful and law-abiding individual. He comes to Pittsburgh to seek better economic and social opportunities. He is in most instances anxious to let others alone in order that he himself may be let alone."

The statistics gathered relating to the health of the Negroes in Pittsburgh tend to confirm a fact already recognized, that the conservation of health is not so much a problem of the individual as of the whole community, and, in the case of the Negro, is interrelated with his social, moral, industrial, housing, and racial situation. Tables are given showing an increase of 78.6 per cent in the number of deaths in the first 7 months of 1917 as compared with the same period in 1915, before the migration, and this in face of the fact that the Negro population increased about 45 per cent in the same time. Climatic conditions may be responsible for this to a large extent, since the record shows an increase of about 186 per cent in the deaths from pneumonia.

The report concludes with some constructive suggestions looking toward the solution of a race problem through race cooperation. In order to solve the problem of social and industrial maladjustment, lack of organization and absence of intelligent guidance, the National League on Urban Conditions among Negroes, composed of white and colored men, with branches in 18 cities, is attempting to secure cooperation among the races and to act as a social medium between the two peoples.

EMPLOYMENT AND UNEMPLOYMENT.

WORK OF PUBLIC EMPLOYMENT OFFICES IN THE UNITED STATES AND OF PROVINCIAL EMPLOYMENT OFFICES IN CANADA.

Data are presented in the following table showing the operations of the public employment offices for the month of December, 1917, and in cases where figures are available, for the corresponding month in 1916. For the United States figures are given from Federal-State employment offices in two States, a Federal-municipal employment office in one State, State employment offices in 15 States, a State-county-municipal employment office in one State, State-municipal employment offices in two States, municipal employment offices in five States, and a municipal-private employment office in one State. Figures from two Canadian employment offices are also given.

REPORT OF EMPLOYMENT EXCHANGES IN THE UNITED KINGDOM (GREAT BRITAIN AND IRELAND) FOR FOUR WEEKS ENDING NOVEMBER 9, 1917.

As reported by the British Labor Gazette of December, 1917, the total number of work people remaining on the registers of the 383 British employment offices on November 9, 1917, was 110,129, compared with 107,736 on October 12, 1917, and with 114,513 on November 10, 1916. These figures comprise workers in professional, commercial, and clerical, as well as industrial occupations.

The operations of the employment exchanges for the four weeks are summarized as follows:

Item.	Men.	Women.	Boys.	Girls.	Total.
On registers Oct. 12, 1917.....	28,519	63,883	7,024	8,310	107,736
Number of individuals registered during period.....	93,073	132,671	21,982	19,727	267,453
Total.....	121,592	196,554	29,006	28,037	375,189
Reregistrations during period.....	3,567	3,800	448	355	8,170
On registers Nov. 9, 1917.....	30,689	63,267	7,626	8,547	110,129
Vacancies notified during period.....	85,480	63,985	12,646	11,025	173,136
Vacancies filled during period.....	54,879	54,890	10,421	8,473	128,663
Applicants placed in other districts.....	15,225	11,081	1,514	1,105	28,925

The average daily number of registrations and of vacancies filled for the four weeks ending November 9, 1917, is shown in the following table, together with comparative figures for October 12, 1917, and November 10, 1916:

Department.	Average registrations per day in period ending—			Average vacancies filled per day in period ending—		
	Nov. 9, 1917.	Oct. 12, 1917.	Nov. 10, 1916.	Nov. 9, 1917.	Oct. 12, 1917.	Nov. 10, 1916.
Men.....	4,027	3,432	3,686	2,287	1,929	2,040
Women.....	5,686	5,586	6,416	2,287	2,080	2,500
Boys.....	935	870	772	434	396	392
Girls.....	837	826	852	353	341	364
Total.....	11,485	10,714	11,726	5,361	4,746	5,296

EMPLOYMENT IN SELECTED INDUSTRIES IN DECEMBER, 1917.

The Bureau of Labor Statistics has received and tabulated reports concerning the volume of employment in December, 1917, from representative manufacturing establishments in 13 industries. Comparing the figures for December, 1917, with those from identical establishments for December, 1916, it appears that in 5 industries there was an increase in the number of people employed and in 8 a decrease. Men's ready-made clothing shows an increase of 15.9 per cent while silk shows a decrease of 9.1 per cent.

Each of the 13 industries shows an increase in the total amount of the pay roll for December, 1917, as compared with December, 1916. The greatest increase shown—38.4 per cent—is in men's ready-made clothing. Woolen and iron and steel show increases of 37.9 and 35.5 per cent, respectively.

COMPARISON OF EMPLOYMENT IN IDENTICAL ESTABLISHMENTS IN DECEMBER, 1916, AND DECEMBER, 1917.

The table below shows the number of persons actually working on the last full day of the reported pay period in December, 1916, and December, 1917. The number of establishments reporting on this question is small and this fact should be taken into consideration when studying these figures.

COMPARISON OF EMPLOYMENT IN IDENTICAL ESTABLISHMENTS ON LAST FULL DAY'S OPERATION IN DECEMBER, 1916, AND DECEMBER, 1917.

Industry.	Establish- ments re- porting for December, both years.	Period of pay roll.	Number actually work- ing on last full day of reported pay period in December—		Per cent of increase (+) or de- crease (-).
			1916	1917	
Boots and shoes.....	16	1 week...	6, 967	6, 282	- 9.8
Cotton manufacturing.....	29	...do....	24, 079	23, 391	- 2.9
Cotton finishing.....	14	...do....	11, 101	11, 144	+ .4
Hosiery and underwear.....	14	...do....	11, 853	11, 882	+ .2
Woolen.....	37	...do....	33, 257	36, 603	+10.1
Silk.....	19	2 weeks..	7, 116	6, 462	- 9.2
Men's ready-made clothing.....	4	1 week..	3, 367	3, 579	+ 6.3
Iron and steel.....	81	½ month..	128, 104	134, 399	+ 4.9
Car building and repairing.....	15	...do....	21, 251	20, 627	- 2.9
Cigar manufacturing.....	12	1 week...	3, 550	3, 561	+ .3
Automobile manufacturing.....	24	...do....	74, 633	69, 063	- 7.5
Leather manufacturing.....	16	...do....	6, 319	6, 533	+ 3.4
Paper making.....	13	...do....	8, 866	8, 848	- .2

The figures in the table below show that in 11 of the 13 industries there were more persons on the pay roll in December, 1917, than in November, 1917. Car building and repairing shows the largest increase—4.9 per cent—while silk and automobile manufacturing show decreases of 0.9 and 0.5 per cent, respectively.

Of the 13 industries reporting, 8 show increases and 5 decreases in the total amount of pay roll when comparing December, 1917, with November, 1917. Boots and shoes and leather manufacturing show increases of 18.1 per cent and 9.8 per cent, respectively. The greatest decrease indicated—5.2 per cent—is shown in automobile manufacturing, while iron and steel shows a decrease of 3.4 per cent, which decrease is doubtless explained by a shortage of fuel experienced by many plants during the pay-roll period under consideration.

CHANGES IN WAGE RATES.

In 8 of the 13 industries there were establishments reporting increases in wage rates during the period November 15 to December 15, 1917, and in 5 industries no establishment reported a change. A number of firms did not answer the inquiry relating to the wage-rate changes, but in such cases it is probably safe to assume that no changes were made.

Cotton manufacturing: Reports from 14 plants show increases in the wage rates. One plant reports an increase of $12\frac{1}{2}$ per cent to the entire force. One plant reports a 12 per cent increase to all employees except the office force. Eight plants report an increase of 10 per cent to all employees; while another plant reports an increase of 10 per cent to 96.5 per cent of its force. One plant reports an 8 per cent increase to all the force; and one plant, a 5 per cent increase to all its employees.

Paper making: Reports from three plants show changes in the wage rates. One plant reports a 10 per cent increase to 60 per cent of its force; one, 5 per cent increase to its entire force; and a third, 75 cents per day increase to all its employees.

Car building and repairing: Two plants show changes in the wage rates. One plant reports an increase to all of the employees, but does not make a definite statement as to the amount of increase; and the second plant reports a 10 per cent increase to 8 per cent of the force.

Men's ready-made clothing: One establishment reports an increase of 10 per cent to 40 per cent of its employees; and another, an increase to all cutters, but makes no statement as to the per cent of increase.

Hosiery and underwear: One plant reports an increase of 15 per cent to all of its employees; while a second reports bonuses of from 5 to 10 per cent to the entire force.

Automobile manufacturing: One plant reports a 10 per cent increase to 8 per cent of its force.

Boots and shoes: One plant reports a 10 per cent increase in some departments.

Iron and steel: One plant reports an increase of 10 per cent to time workers.

INDEX NUMBERS OF EMPLOYMENT AND OF PAY ROLL, JANUARY, 1915, TO DECEMBER, 1917.

Index numbers showing relatively the variation in the number of persons employed and in pay-roll totals in seven industries by months from January, 1915, to December, 1917, have been compiled and are presented in the following table. These index numbers are based on the figures for "Employment in selected industries," appearing in this and preceding REVIEWS. The seven industries shown are the only ones for which the Bureau of Labor Statistics has comparable data as far back as January, 1915.

January, 1915, is taken as the starting point, and the number of persons whose names appeared on the pay roll for that month represents 100. The amount of money carried on the pay rolls is treated in the same manner. To illustrate, if the number of persons employed in the iron and steel industry in January, 1915, is taken as 100, then the number employed in that industry in December, 1917, was 183; in other words, had increased 83 per cent; and, if the money pay roll in January, 1915, be taken as 100, the pay roll in December, 1917, represented 335, or in other words, the amount paid in wages was more than 3½ times as much as in January, 1915.

While the index numbers show the change in the number of persons employed and in the aggregate amount of money paid in wages, they do not, without a computation, indicate the change in per capita earnings. Such increase may be obtained by dividing the index for the amount of the pay roll by the index for the number of persons on the pay roll. The per cent of such increase in December, 1917, as compared with January, 1915, has been computed and entered at the bottom of the table. Thus the per capita earnings of boot and shoe factory employees increased 76 per cent; of cotton manufacturing employees, 63 per cent, etc.

VOLUME OF EMPLOYMENT IN THE UNITED KINGDOM (GREAT BRITAIN AND IRELAND) IN NOVEMBER, 1917.

The table below pertaining to the condition of employment in Great Britain and Ireland was compiled from a report published in the British Labor Gazette of December, 1917.

No material changes relating to the number of employees in November, 1917, as compared with October, 1917, are shown except for seamen which show a decrease of 8.9 per cent in the number of men. The carpet trade shows an increase of 2.4 per cent, but no other trade shows a change of more than 2 per cent.

In comparing November, 1917, with November, 1916, as to numbers employed, more important changes are seen. Dock and riverside labor shows a decrease of 25.7 per cent; seamen a decrease of 21 per cent; food preparation a decrease of 14.5 per cent; while dress-making and millinery, quarrying, tin plate, steel and galvanized sheet, cotton, and corset trades, show a decline of from 10 to 12.1 per cent each. Iron and steel and tailoring trades show the greatest increases—6.8 per cent and 5.1 per cent, respectively.

In November as compared with October but two trades show a decrease in earnings, namely: Cotton, 0.1 per cent; and bleaching, printing, dyeing, and finishing, 1.2 per cent. The jute trade shows an increase of 10.7 per cent; bookbinding, 8.2 per cent; printing, 6.9 per cent; while the other trades show increases ranging below these figures.

Comparing November, 1917, with November, 1916, on the question of earnings of employees important changes are shown, all of which are increases, except in the cotton trade which shows no change. The tailoring trades show an increase of 40.5 per cent; linen, an increase of 38.4; brick, an increase of 30.1 per cent; jute, an increase of 23.5 per cent; and worsted, an increase of 20.7 per cent. Ten trades show increases ranging from 10.3 per cent to 19.6 per cent, while the other trades reporting increases of earnings of employees show changes of less than 10 per cent.

VOLUME OF EMPLOYMENT IN THE UNITED KINGDOM (GREAT BRITAIN AND IRELAND) IN NOVEMBER, 1917, AS COMPARED WITH OCTOBER, 1917, AND NOVEMBER, 1916.

[Compiled from figures in the Labor Gazette (London), December, 1917.]

¹ No change.

² Based on unemployment returns.

The table following shows, by occupation groups, the number of individuals registered, the vacancies notified and the vacancies filled, indicating the extent of unemployment in Great Britain during the four weeks ending November 9, 1917. The totals for this period are also compared with the totals for the five weeks ending October 12, 1917:

INDIVIDUALS REGISTERED, VACANCIES NOTIFIED, AND VACANCIES FILLED IN THE

Casual employment (men only)	57		-----		1,484		-----		-----	

This table shows that, during the period considered, in the insured trades, 115,297 adults registered for work—60,228 men and 55,069 women. There were 99,582 vacancies reported—62,683 men, 30,686 women, 4,197 boys, and 2,016 girls. The number of positions filled was 76,643—42,158 men, 29,085 women, 3,685 boys, and 1,715 girls.

The occupation groups in which the largest number of positions were filled by adults were: Ammunition and explosives, 13,734; laborers—engineering, 8,994; metal machinists, 8,234; erectors, fitters, and turners, 6,970; works of construction, 6,707; other skilled occupations—engineering, 4,547; and laborers—building, 4,354.

In the uninsured trades there were 110,447 registrations—32,845 men and 77,602 women. The number of vacancies reported was 73,554—22,797 men, 33,299 women, 8,449 boys, and 9,009 girls. The total number of positions filled was 52,020—12,721 men, 25,805 women, 6,736 boys, and 6,758 girls. The occupation groups in the uninsured trades, in which the largest number of positions were filled by adults were: Domestic service, 12,825; conveyance of men, goods, etc., 6,062; general laborers, 4,378; commercial and clerical, 4,150.

The total number of positions filled by adults in both the insured and uninsured trades during the 4 weeks ending November 9, 1917, as compared with the preceding 5 weeks, shows a decrease of 8.7 per cent. The decrease in the number of positions filled by men was 5.2 per cent; by women, 12 per cent. Much the largest number of women were employed in the manufacture of ammunition and explosives and in domestic service.

No comparison can be made between the number of registrations in the employment exchanges of Great Britain and the number of applications for work reported by the employment offices of the United States, owing to the differences in method of registering applicants. It is possible, however, to make a comparison of positions filled by the offices in the two countries. The figures show the following results:

	Number of offices.	Positions filled.		
		Total.	Average per day.	Average per day, each office.
Great Britain.....	383	128,663	5,361	14.0
United States.....	145	122,610	4,715	32.5

The above figures are significant in view of the fact that a very large percentage, if not practically all, of the employment office work of Great Britain is done through the free employment exchanges, while in the United States but a very small proportion of the placements is made through the public employment offices, the much greater proportion being handled by the private employment agencies.

EMPLOYMENT MANAGERS' CONFERENCE AT PHILADELPHIA.

Bulletin 227, recently issued by this bureau, contains the proceedings of the Third Conference of Employment Managers, which was held at Philadelphia, April 2 and 3, 1917. This conference was attended by about 500 representatives of employment managers' associations located in Boston, Chicago, Cleveland, Detroit, Newark, New York, Philadelphia, Pittsburgh, Rochester, and San Francisco, though the membership of the associations is not confined to firms in the cities named; the Boston association, for example, includes the most important industrial centers in New England. About 1,000 industrial companies are enrolled as members of the 10 associations.

The organization of these associations was the result of the recognition by employers that a changed policy must be adopted toward their employees; that the greatest waste in all industries is the waste of labor due to bad systems or no systems of handling employees, resulting in irregular work, too little work, too much work, no work, unsuitable work, no training for work, training for no work, and bad conditions of work; and that employment managers should have opportunity for exchange of ideas in order that the best methods of handling the labor force may be adopted, thus bringing about a reduction in the cost to the employer of a high labor turnover. The first employment managers' conference was held at Minneapolis in January, 1916; the second at Boston in May, 1916.

It is believed that the output of labor per man could be greatly increased—perhaps as much as 60 per cent—by a rational system of management which would give due regard to the worker's health and safety. A proper system of labor management would provide for workers ample time and facilities for rest and healthful recreation. Wages must be sufficient to provide the workers with needed food, clothing, shelter, and fuel to maintain health and strength at the maximum. Economy of consumption, that is, the art of spending the dollar wisely, is even more important than economy of production, the art of earning the dollar. Employers, working as citizens, can do much to develop and improve in their workers the art of getting 100 cents' worth of utility for every dollar paid in wages.

All this has nothing whatever to do with speeding up machinery, cutting down piece rates, working longer hours, and the like stock methods of trying to increase output per man per day and per dollar of wages. It has rather to do with shortening the working day, providing rest periods at convenient intervals, advancing piece and time rates, cutting out all overtime, re-creating in the employee an interest in the job he is doing, and helping him to get the most out of his earnings and his leisure.

The addresses and discussions contained in this report show that the employers and employment managers in attendance at the Philadelphia conference realized the importance of the employment problem and manifested real industrial statesmanship in attacking it. The matter of labor turnover—the proportion of the number of employees engaged in a year to the total number of employees on the pay roll—was given particular attention, since this is one of the greatest problems with which employment managers have to contend. Among the practical plans mentioned for reducing labor turnover were proper selection of employees, payment of adequate wages, provision of steady work, promotion of physical efficiency, fostering of good habits, hearing of complaints, and provision for the future of workers by pensions, profit sharing, etc. The question of selection of employees and termination of employment formed the basis of discussion during an entire session, and the matter of following up after hiring, including service work, employees' benefit associations, and mutual aid associations, was discussed at length by a number of speakers.

A feature of the conference was the adoption of a resolution providing for a national committee of employment executives with one representative from each employment managers' association. This committee was subsequently appointed and at a meeting held in May decided that its purpose should be to bring about a closer cooperation between organizations devoted to the study of employment problems, to arrange for national conferences, and to assist in the interchange of reports of meetings, investigations, and information of interest to local associations. It was decided not to form a national association as yet, although if the movement continues to grow such a step will probably be taken in the near future.

LABOR ORGANIZATIONS.

GERMAN FREE TRADE-UNION COUNCILS IN 1916.¹

The statistics of the German Free Trade-Union Councils (*Gewerkschaftskartelle*) for the year 1916 show even more than those for the preceding year the unfavorable influence of the protracted state of war upon the trade-union movement. Of the 641 trade-union councils carried on the lists of the Central Federation (*Generalkommission*), to which questionnaires were transmitted by the latter, only 469, or 55 less than in the preceding year, participate in the statistics for 1916. In many instances local unions affiliated with trade councils failed to report to the councils their membership so that the membership returns of a considerable number of councils are incomplete.

The trade councils have suffered to greater extent from the war than the local unions. The latter, even if they have lost members and officers during the war, have always found strong support in their federations (*Zentralverbander*), while the former, as local organizations of the trade-unions, are more loose creations, and their activities become paralyzed whenever there is a lack in the locality of leaders able to maintain the combine of the local unions even in the face of greatly reduced membership. The annual report, however, points out that the nonparticipation of a number of councils in the statistics does not mean that these councils have been dissolved or have discontinued all their activities. Failure to transmit a report was in most instances due to the lack and continuous change of officers. In some instances, to be sure, the activities of councils have been temporarily discontinued, but the combine of the local unions is nevertheless being maintained. For all these reasons the number and membership of trade-union councils can not be determined correctly for the present and only after the termination of the war will it be possible to ascertain the actual extent of their decrease.

It should be noted here that the present statistics do not include all trade-union councils existing in Germany but only those of the free trade-unions. The Hirsch-Duncker trade societies and the Christian trade-unions have not published trade-union council statistics since 1913, nor are they expected to do so in the near future.

The 469 trade-union councils included in the statistics for 1916 had affiliated with them 5,846 trade-unions with a total membership of 837,492. At the close of the second quarter of 1914, i. e., shortly be-

¹ Correspondenzblatt der Generalkommission der Gewerkschaften Deutschlands. Statistische Beilage No. 2. Berlin, Sept. 1, 1917.

fore the outbreak of the war, the same councils had a membership of 2,090,637. A comparison of the figures for these two years shows that the membership has decreased 60 per cent. Of the above 837,492 members, 4,189 belong to the independent South German Railroad Employees' Federation and 833,303 to national federations affiliated with the general commission. According to the statistics of the general commission the federations affiliated with it (inclusive of the domestic servants' and agricultural workers' federations) had a total membership of 944,575 at the end of 1916. In the statistics of trade-union councils 88.2 per cent of this membership were therefore included, as against 88.4 per cent in 1915 and 91.4 per cent in 1913. For the proper understanding of these percentages it should be remarked that not all the members of national federations are affiliated with trade-union councils.

Of the trade-union members affiliated with councils, 235,604 belonged to the metal workers' federation, 73,120 to the factory workers' federation, 60,529 to the building trades' federation, 60,321 to the woodworkers' federation, and 57,617 to the transportation workers' federation. These five federations furnished over one-half of the total membership of all councils. The following trade-union councils had, in 1913, a membership in excess of 25,000, and in 1916 the membership shown below, with the membership for 1913 shown within parentheses: Berlin, 138,901 (302,052); Hamburg, 47,522 (143,338); Dresden, 46,161 (95,629); Leipzig, 32,059 (76,185); Munich, 30,036 (63,594); Nuremberg, 21,296 (55,723); Frankfort-on-the-Main, 12,914 (43,807); Stuttgart, 16,333 (43,483); Chemnitz, 15,751 (42,403); Bremen, 12,617 (37,311); Hanover, 13,932 (37,311); Breslau, 1,274 (31,732); Cologne, 3,865¹ (31,176); and Magdeburg, 15,025, (30,766).

The importance of the councils for the trade-union movement is of a strictly local character. Their principal task consists in the promotion of the expansion and in the strengthening of the local unions. During the war, however, most of the councils have discontinued their propaganda activity. This is shown by the fact that the number of meetings held by them was very small in 1916. The total number of meetings held during the year was 672, of which 410 were general meetings and 262 trade meetings. Another important activity of the councils, the making of arrangements for the elections of workmen's representatives to the socio-political bodies, has been discontinued entirely during the war because the Government has extended the term of office of the present representatives indefinitely until the termination of the war. The state of war has not made any changes in the character of the institutions created by the trade-union councils.

¹ Incomplete.

The number of committees created for special purposes has, however, decreased considerably, and, according to communications and business reports received by the general commission, many of these committees have reduced their activities to a minimum or discontinued them temporarily. The 469 councils included in the statistics for 1916 report the existence of 256 educational committees and 241 committees on juvenile membership. Committees for complaints relating to matters of factory inspection were in existence in 59 localities, committees for the combating of boarding and lodging systems in 28 localities, and committees for the protection of building trade workers in 134 localities.

Institutions very valuable to the working classes are the workmen's secretariates and legal information bureaus maintained by trade-union councils. The state of war has even increased their importance and made imperative their maintenance under all circumstances in spite of financial difficulties. In localities in which the councils on account of greatly decreased membership were unable to maintain workmen's secretariates from their own means the general commission has granted subsidies for their maintenance. The total number of secretariates maintained in 1916 was 113 as against 115 in the preceding year. The number of legal information and aid bureaus has decreased considerably in the year under review, their total number being 123. The reason for this decrease is to be found in the great lack of persons sufficiently familiar with social legislation to be able to give information and aid in disputes at law. Trade-union bureaus in which the affairs of trade-union councils are attended to by salaried employees were in existence in 21 large localities.

In the period preceding the war trade-unions in large localities generally endeavored to create a point of concentration for the trade-union movement by the establishment of trade-union halls. For financial reasons these endeavors could not be continued during the war. The statistics for 1916 show the existence of 73 trade-union halls, of which only 42 are built on land owned by the local council, the other 31 being located in rented buildings; 240 councils had made provisions for the lodging of traveling trade-union members, 33 councils having lodging houses of their own, mostly located in trade-union hall buildings, while the remaining 203 councils had made agreements with private hotels and lodging houses. The educational requirements of trade-union members were taken care of by the councils by the maintenance of libraries in 365 localities and of reading rooms in 88 localities.

The trade-union councils are supported by the contributions of the affiliated trade-unions. As a rule, the contribution is fixed per member per year. Separate contributions are sometimes levied for the council proper, for the secretariate, and for educational purposes.

Some councils assess female members lower than male members. The annual contributions of male members vary between 0.20 and 2.60 marks (4.8 to 61.9 cents).

The following two tables show the membership movement and total receipts and expenditures of German trade-union councils for the 16 years ended 1916, and their expenditures in detail for the years 1912-1916:

NUMBER, MEMBERSHIP, RECEIPTS, AND EXPENDITURES OF GERMAN FREE TRADE-UNION COUNCILS, 1901 TO 1916.

The first of the preceding two tables shows that up to and including 1913 the financial strength of the trade-union councils has with small fluctuations steadily increased. The *Correspondenzblatt*, the organ of the general commission, in reviewing the statistics, states that "this upward movement of receipts is not the sole result of the increased trade-union movement but is largely due to the increased sphere of activities of the councils. With the outbreak of the war the total receipts and expenditures of the councils show, of course, a great falling off. That this falling off of the total receipts and expenditures has not decreased the importance of the councils within the trade-union movement can, however, be proved by the per capita receipts and expenditures. Per member and per year the receipts in 1901 were 61 pfennigs [14.5 cents]. By 1913 they had increased to 93 pfennings [22.1 cents] and in 1916 they amounted to 1.29 marks [30 cents]. During the war the per capita receipts have therefore not decreased but considerably increased and the per capita expenditures have moved parallel to the receipts."

WORKMEN'S COMPENSATION.

WORKMEN'S COMPENSATION PAYMENTS TO ENEMY ALIENS OR THEIR DEPENDENTS.

The declaration of war by the United States, and especially the Trading with the Enemy Act, has brought up the question of the rights of aliens to accident compensation under the various State compensation laws. Most of the State laws specifically provide that nonresident alien beneficiaries are entitled to compensation, although some of the acts establish limitations either by reducing the amount of benefits or by limiting the classes of beneficiaries to whom payment may be made.

This problem has become increasingly important since the declaration of war against Austria-Hungary. As pointed out in an article in the *Economic World* by Mr. A. R. Marsh,¹ in all of our important industries multitudes of Austrians, Hungarians, Bohemians, and Austrian Slavs of the various kinds, are to be found; and in certain of these industries, as coal mining, they do a very large part of the work. An authoritative and immediate declaration as to the legal status of enemy aliens and their dependents under the State compensation laws becomes apparent. A concrete case has just arisen in Wisconsin because of the refusal of a casualty insurance company to pay compensation to enemy aliens on the ground that such payments are now contrary to the Trading with the Enemy Act. The Wisconsin Industrial Commission immediately took the matter up with the War Trade Board, which advised the commission that a distinction is to be made between compensation payments to enemy aliens resident in the United States and those to alien residents in an enemy country itself.

The former class of persons are in fact not "enemies" in a technical sense, under our laws, unless they engage in hostile acts or give aid and comfort to the enemy by trading with actual enemy aliens or otherwise. Accordingly, until citizens of Germany and Austria-Hungary * * * who are employed in American industries are guilty of acts of war against the United States, or until they are specifically proclaimed by the President to be "enemies," they stand upon precisely the same footing as American citizens in respect of their

¹ "Workmen's compensation payments to enemy aliens or their dependents," by Arthur Richmond Marsh. *The Economic World*, New York, Dec. 8, 1917, p. 812.

rights under workmen's compensation laws—at least in so far as payments of compensation benefits to themselves or to beneficiaries resident in the United States are concerned. It is, therefore, in the opinion of the War Trade Board, not a valid defense for an insurance carrier against workmen's compensation claims that the insured or their beneficiaries (if resident in the United States) are nationals of an enemy country. Such a defense can come into play only upon sufficient proof that the recipients of the compensation have created for themselves a status as "enemies."

With regard to payments of compensation benefits to persons actually resident in enemy countries and nationals thereof, the War Trade Board seems to have found it much less easy to interpret the law. It was able to give the Wisconsin commission, at the conference, no definition of the rights of such persons nor of the manner in which they should proceed to enforce these rights, if they possess them. So far as is known at this writing the War Trade Board has even yet arrived at no final determination of the question. In the meantime insurance companies, employers or others holding moneys in trust for enemy alien dependents of fatally injured workers of enemy nationality are required by the Federal statute to report the fact to the Alien Property Custodian, Hon. A. Mitchell Palmer, Washington, D. C.

SELECTION OF PHYSICIANS UNDER ILLINOIS COMPENSATION ACT: A CORRECTION.

In an article on "Tendencies in workmen's compensation legislation in the United States," which appeared on pages 144 to 148 of the MONTHLY REVIEW for December, 1917, it was erroneously stated that Illinois in 1917 for the first time granted injured employees the right to select the physician under the compensation law. There has been no change in this medical provision since the enactment of the original law. An employee can select his own physician now as always, but does so at his own expense. He does not, however, as in the other States mentioned, possess the right of selecting the physician when the expenses are borne by the employer.

AMENDMENT OF WORKMEN'S ACCIDENT INSURANCE LAW IN AUSTRIA.¹

The law of August 21, 1917, passed by both houses of the Austrian Parliament (*Reichsrath*), amends the workmen's accident insurance law of December 28, 1887, and the extension law of July 20, 1894, as follows:

The maximum amount of the computable annual earnings has been increased from 2,400 to 3,600 crowns (\$487.20 to \$730.80). In the case of apprentices working without or for a nominal compensation the maximum computable earnings are fixed by the new law at

¹ Austria. Reichsgesetzblatt, No. 156. Vienna, Aug. 31, 1917.

1,200 crowns (\$243.60), in place of 600 crowns (\$121.80), and the minimum computable earnings at 600 crowns. In the case of apprentices earning more than 1,200 crowns per year their actual earnings are to be considered as computable earnings.

The new law provides that in the future accidents occurring during the performance of domestic or other services, to which the insured is assigned by his employer, or by a superior in addition to his insurable occupation and during the period of employment in this occupation, shall also be compensated. It also settles a question which has been brought up ever since the enactment of the insurance law by explicitly providing that accidents occurring during the journey of the insured from his place of residence to his working place, or vice versa, shall be compensated in the same manner as accidents occurring while the insured is in the actual exercise of his employment.

The maximum amount of the pension (full pension) in case of total disability has been increased from 60 to 66 $\frac{2}{3}$ per cent of the annual earnings. The full pension may also be granted temporarily as a *reconvalescence pension to injured persons who are no longer totally disabled* but need special care in order that their full earning capacity may be restored or their condition improved. One and one-half times the full pension may be granted to injured persons who, consequent to an accident, are so helpless after the termination of the medical treatment that they need an attendant and care. The maximum funeral benefit has been increased from 50 to 100 crowns (\$10.15 to \$20.30).

The provisions relating to survivors' pensions have been amended as follows: Illegitimate children, provided their paternity has been recognized or legally established, are given the same status with respect to pension claims as legitimate children. The maximum total amount of the combined pensions of all survivors of an insured person has been increased from 50 to 66 $\frac{2}{3}$ per cent of the latter's annual earnings. Grandchildren and brothers and sisters of the deceased insured person have up to their completed fifteenth year of age a claim to pension in the amount of 20 per cent of his annual earnings, provided that the deceased has during his lifetime essentially contributed to their support. In case of their total disability on the completion of the fifteenth year of age their pension may be continued as long as the disability lasts.

The new law provides that the employer must pay the entire insurance premium. Formerly the employer paid only 90 per cent of the premium. The law became effective July 1, 1917, and all accidents occurring after June 30, 1917, are to be compensated according to the provisions of the new law.

RETIREMENT OF EMPLOYEES ON STATE RAILWAYS IN CHILE.¹

The law of February 15, 1911, designated as "the law requiring State railroads to establish a savings fund," provides for the retirement of incapacitated salaried employees and laborers and for the compensation of persons injured while in the course of employment. The fund is constituted by deducting 5 per cent from the wages of all employees; by retention of the first monthly increase in wages automatically provided by law; of that part of the month's wages not paid to an employee on account of absence due to inability to work, or to the death of employees; of fines or penalties deducted from wages because of imperfect work; of unclaimed pay; of 1½ pesos (54.8 cents) out of every 1,000 pesos (\$365) of receipts; and from other sources.

Office employees who have been in the service 10 years at the time this act becomes effective, and who are absolutely incapacitated for labor, may be retired with as many fortieths of 75 per cent of earnings as they may have been years in such service.

Day laborers employed as engineers, in maintenance of way, upkeep of engines, cars, etc., having 10 years' service may be retired when absolutely incapacitated for labor, with 50 per cent of wages.

Persons engaged in the upkeep of rolling stock, having completed 30 consecutive years of service, and being 65 years of age, or who become incapacitated, may be retired on 50 per cent of wages.

For computing earnings a year's work must be considered as not less than 250 days' work.

Permanent incapacity due to injuries resulting from accident is to be compensated by the payment of full wages.

Employees who by reason of accidents while in service receive injuries or contusions which result in temporary incapacity shall be compensated by the payment of full wages, not exceeding 6 months. If upon the expiration of this period they should not have recovered, their position shall be assured them for 6 months, but without pay.

In case of death from accident, the widow, children, and mother, if a widow, have a right to a yearly compensation for 10 years equal to one-fourth of the wages earned by the deceased employee.

Bonuses, extra pay, etc., are not considered as wages. All compensation is computed on the basic pay and biennial increases provided by law.

¹ *Leyslacion sobre Accidentes del Trabajo*. Ministerio del Interior. 1917. P. lxxviii.

INDUSTRIAL ACCIDENTS AND DISEASES.

REPORT OF CALIFORNIA INDUSTRIAL ACCIDENT COMMISSION.

The following summary of the California Industrial Accident Commission's report for the year ending June 30, 1917, is taken from an advance press notice furnished by the commission. The report itself has not yet been received.

In 1916 there were 94,879 industrial injuries reported to the commission. This large total is divided into three main groups: Fatal injuries, 657; permanent injuries, 1,709; temporary injuries, 92,513. Fifty-seven of the fatalities occurred on the high seas. Total dependents to the number of 663 were left as the result of 300 fatalities; 113 partial dependents were left in 53 fatal cases, and in 304 fatal cases there were no dependents. The average age of the wives left dependent was 39.9 years, and the children's average age was 10.5 years. Twelve of the serious and permanent injury cases resulted in the commission awarding life pensions. There were 16,294 injuries that caused a time loss of 15 days or more. The remaining injuries came within the two weeks waiting period.

COMPENSATION AND MEDICAL COSTS.

California's 94,879 hurt workers were awarded \$2,398,232.01 in compensation. This sum includes the estimates in all death and permanent injury cases. The medical, surgical, and hospital payments totaled \$1,109,072.82. The total for both compensation and medical costs is \$3,507,304.83.

ELECTION OF COMPENSATION.

Compensation can be elected by farmers and householders and their employees, as well as by those hiring casual employees outside of the regular business of the employer. The thousands of acceptances during the past fiscal year bring the grand total filed up to 25,890, divided as follows: Farming and kindred occupations, 13,619; domestic, 1,533; casuals, 10,738.

COURT DECISIONS.

On February 3, 1917, the Supreme Court of the State of California, by a unanimous vote, decided the Industrial Accident Commission had jurisdiction over injuries sustained in maritime service. The case is known as the North Pacific Steamship Co. v. Industrial Accident Commission. On May 21, 1917, the Supreme Court of the United States decided by a five to four vote that the New York compensation statute could not be admitted to operate in cases of maritime employment. The test case is known as Marie Jensen v. Southern Pacific Co. The similarity of the New York and California compensation laws resulted in the nullification of the California Supreme Court's decision when

the highest court of the land decided the issue. (Since this decision Congress has amended the Judicial Code to give concurrent jurisdiction to States having compensation laws.)

COMPENSATION DEPARTMENT.

There was an increase of about 18 per cent, compared to the previous year, in the number of controversies between employers and employees submitted to the commission for decision. The average time of the ordinary case between filing an application for adjustment of claim and a decision was 62½ days. The previous year's average was 75 days. Some cases required answers to interrogatories sent to Europe. In some instances years elapsed before the returns were made.

In deciding 1,393 contested cases there were held 1,962 hearings, and 260 cases were acted upon without hearing. The supplementary proceedings before the commission numbered 850.

Compensation was awarded to employees in 61 per cent and denied in 22.9 per cent of the cases filed. The main issues presented to the commission were "Extent and duration of disability" and "Whether injury was in the course of the employment."

RATINGS FOR PERMANENT DISABILITIES.

The California law stands alone in considering loss of earning power as the sole basis for awarding compensation in permanent injury cases. The three factors on which awards are based are: (1) Nature of injury or disfigurement; (2) occupation; (3) age. There were 1,487 permanent injuries referred to the department. Of this number 1,420 were rated; 31 were found not to be permanent; 3 lacked the necessary data, and 33 were undecidable at the end of the fiscal year.

MEDICAL DEPARTMENT.

During the last fiscal year the medical departments of the Industrial Accident Commission and the State Compensation Insurance Fund were separated. There were 529 formal opinions rendered in the San Francisco office and 82 in the Los Angeles office. These figures do not include the greater number of informal and personal examinations. There were 290 medical examiners appointed by the medical director in San Francisco and 150 by the assistant medical director in Los Angeles. The acceptance of industrial injury cases by poorly equipped medical men is deplored and "constant practice" is condemned. A plea is made for skilled surgery as not only the best, but also the cheapest for all concerned.

STATE INSURANCE.

The continued success of the State Compensation Insurance Fund is referred to with pride by the commission. The State insurance commissioner now has more power in supervising companies writing compensation insurance. A law requires that companies deposit surety bonds or securities with the State treasurer to an amount not less than the loss reserve. When it was proposed to increase compensation insurance rates to California employers approximately 37 per cent, the commission attempted, unsuccessfully, to have the law amended so the State Compensation Insurance Fund could make independent rates based upon its lower operating cost. The fund has, under the law, to continue to

charge the minimum rate approved by the insurance commissioner, but the excess will be returned to the policyholders in dividends.

The fund is now doing about 25 per cent of the total compensation business transacted in California and nearly three times the business done by its nearest competitor. The fund's business in 1917 shows an increase of approximately 40 per cent over the previous year, and will exceed \$1,250,000. The sum of \$268,208.27 has been paid in refunds to policyholders at date of this report.

EFFORTS TO PREVENT INJURIES.

Boiler safety orders became effective on January 1, 1917. Committees of employers and employees and the commission's engineers were engaged during the year in preparing safety orders for window cleaning, trench construction, air-pressure tanks, electrical utilization, logging, and sawmill operations. After public hearings, these safety orders became effective on January 1, 1917, excepting the safety orders for logging and sawmill operations, which became effective on March 15, 1917.

The formation of shop committees was continually urged. All sources of publicity were utilized and the safety department reports a continuance of the fullest cooperation on the part of California's employers and employees.

The mining division was carried on in cooperation with the Federal Government, a mining engineer of the United States Bureau of Mines continuing to head the division. Practically all the operating mines, gold dredges, quarries, and construction tunnels in the State were carefully inspected at least once during the year. The safety requirements affected the safety of about 16,500 men.

United States mine rescue car No. 1 visited various mines in the State and gave training to employees in mine rescue and first-aid work. This car operates in Utah, Nevada, and California.

STATISTICAL INFORMATION.

The comparison of injuries by years is interesting. Deaths: 1916, 657; 1915, 533; 1914, 691. Permanent injuries: 1916, 1,709; 1915, 1,264; 1914, 1,292. Eyes suffering an impairment of vision or removal: 1916, 202; 1915, 175; 1914, 172. Arms amputated: 1916, 20; 1915, 13; 1914, 28. Fingers lost: 1916, 900; 1915, 798; 1914, 872. Legs or feet lost: 1916, 26; 1915, 28; 1914, 45. Toe amputations: 1916, 33; 1915, 40; 1914, 54. In 1916 there were four women workers killed, two in 1915, and two in 1914.

The average age of the killed during the three years 1914-1916 was 38 years and the average wage \$19 a week.

Occupational diseases reported in 1916 numbered 348.

INDUSTRIAL ACCIDENTS AMONG BRIDGE AND STRUCTURAL-IRON WORKERS.

The Bridge and Structural Iron Workers' Union No. 1, of Chicago, has recently published a study of industrial accidents among its own members during the year April 1, 1916, to March 31, 1917. Aside from its intrinsic value, in throwing much light upon acci-

dents in a very hazardous trade, the study is of much significance as representing one of the few instances of a labor union making an effort to diagnose scientifically the accident problem as affecting itself. The following excerpts are taken verbatim from the report.¹

During the 12 months ending March 31, 1917, there were reported to our office 239 accidents to our members while engaged in their regular employment. These 239 accidents in one year is on the very face of it, an entirely too high a toll for the privilege of earning our meager existence. It is regrettable that this local union does not have any previous records with which to make comparisons, in order to ascertain as to whether the present conditions of rushing or speeding up makes our work more hazardous than formerly. To the best of our knowledge no local union within our international organization has ever paid attention to the large waste of human life and efforts with its attendant suffering, incidental to the industrial hazards of our trade. But comparing the above figures with the records of Painters' Local Union 194 of this city—the only local union of the building trades in Chicago that has for a number of years kept statistical records as to causes and prevalence of accidents in their trade—it is shown that the percentage of occurrence is almost twice as high in our trade as compared with the painting trade, the percentage being 4.2 as against 2.2 amongst the painters. It may be added that in the latter are not included accidents causing less than a week's disability, while a small percentage—about 4 per cent—included in our report suffered no actual disability.

The following table gives a general summary of the conditions existing in our local union as to the average age of our members, conjugal relations, number of dependents, the total and average compensation, and amount of local accident benefit paid in accident cases; it also gives the percentage of members injured who did not receive any compensation or accident benefit.

GENERAL SUMMARY OF CONDITIONS OF INJURED MEMBERS OF BRIDGE AND STRUCTURAL IRON WORKERS' LOCAL NO. 1, APR. 1, 1916, TO MAR. 31, 1917.

Number injured.	Average age.	Per cent married.	Dependents.	Compensation.	Average compensation.	Local benefit.	Average local benefit.	Per cent receiving no compensation.	Per cent receiving no local benefit.
	<i>yr. mo. da.</i>								
21	26 6 8	52	20	\$2,339	\$111.38	\$340	\$16.00	38	38
82	34 6 3	73	128	8,025	97.86	1,355	16.52	39	40
70	44 1 11	81	126	6,091	87.00	1,065	15.21	33	39
35	53 4 14	86	46	11,244	330.74	890	26.20	40	50
4	61 3	75	3	564	141.00	175	43.75	25	25
27	No age.	90	42	924	34.22	330	12.22	63	63

* * * Of members injured * * * 21 were between 20 and 30 years of age; 82 were between 30 and 40 years; 70 between 40 and 50; 35 between 50 and 60; 4 were over 60 years of age, and 27 had neglected to report how old they were. More than three-fourths of our injured members were married and had a total of 365 persons depending upon them for support and protection.

¹ Industrial Accident Report to Bridge and Structural Iron Workers' Union, No. 1, of Chicago, Ill., for the period Apr. 1, 1916, to Mar. 31, 1917.

One of the interesting features of the information gathered through our accident records is the amount of compensation received by our injured members under the workmen's compensation law of Illinois. Although a considerable portion of them—40 per cent—received no compensation, presumably because their disability did not last more than one week, or through their neglect to make a proper demand for same, the total amount of compensation reached the respectable sum of \$29,187. * * * Deducting the 96 members constituting the 40 per cent who received no compensation, we have an average of \$204.10 for each of the injured members who did receive compensation.

This may be considered a fairly good argument against those who are averse to political activity by the forces of organized labor. Prior to the adoption of the workmen's compensation law of Illinois, it was almost impossible for the average workmen to secure any financial redress by the filing of personal damage suits, as the three judge-made defenses of the employers, viz., contributory negligence, assumption of risk, and the negligence of fellow servant, were generally strong enough to defeat the case of the injured worker. According to the report of the Liability Commission of Illinois (pp. 12, 13), the average amount recovered in settlement in and out of court, in personal damage suits, where the injury resulted in death, amounted to the paltry sum of \$348.68. The long litigation necessary, and the great expense involved for attorneys and court costs, often left the widow or the dependent children without sufficient recompense to pay the bills contracted during the trial, much less any money to compensate her—as far as money can be considered a compensation—for the loss of her husband and the supporter of their children.

But large as the amount of compensation received may seem, and pleased as we may be for the great improvement secured as the result of the legislative activity of organized labor, we have no reason to be satisfied either with the present compensation law or with the methods of its administration. The insufficiency of the amount of compensation, the frequent delays in securing the same, owing to the refusal of the insurance companies to pay compensation when due, and the necessity of hiring an attorney to take up the legal fight with the shrewd attorneys for the insurance company, are all matters that will have to be taken care of, before we have any right to be satisfied in the matter of compensation for industrial accidents.

HOURLY OF DAY WHEN ACCIDENTS OCCURRED.

Accidents.		Accidents.	
8-9 a. m.	12	12.30-1.30 p. m.	4
9-10 a. m.	30	1.30-2.30 p. m.	31
10-11 a. m.	43	2.30-3.30 p. m.	24
11-12 a. m.	37	3.30-4.30 p. m.	30
	122		89

Out of a total of 211 accidents that occurred during the regular working hours, 122, or 57.8 per cent, occurred in the forenoon; and 89, or 42.2 per cent, occurred in the afternoon.

CLASSIFICATION OF CAUSES OF ACCIDENTS.

Cause.	Number.	Per cent of accidents.
Struck by machinery or falling objects.....	124	51.9
Slipped and fell (lost balance).....	43	18.0
Caught in machinery or material.....	23	9.6
Injured through defective scaffold.....	21	8.7
Stepped on nail, injured by rusty iron.....	14	5.9
Injured by own tools, slipped or broken.....	8	3.3
Burned by electric wires.....	2	.8
Overcome with heat.....	1	.4
Twisted ankle (no cause given).....	1	.4
Scratched hand on column.....	1	.4
Motorcycle skidded, going to new job.....	1	.4
Total injured.....	239	100.0

That nearly 52 per cent of all accidents are caused by being "struck by machinery, or falling objects," gives a good indication as to what means of protection is most necessary. No work should be allowed to proceed where the workmen are exposed to the danger of falling objects, from men working above them, unless a safety floor or netting has been provided to intercept falling objects. A similar protection would also decrease the danger for those 18 per cent who slipped and fell. Accidents caused by defective scaffolding could be prevented by a more efficient inspection and supervision.

But in spite of all the care possible being exercised by the workman, a certain amount of accidents will occur in hazardous employment, as long as present "rushing" or speeding up is permitted to continue.

By shortening the hours of labor, by providing more time for rest and recreation, by making every accident much more expensive to the employer not only as an individual, but as a class, we will be able to most effectively combat the danger to which members of our craft are exposed.

The degree of injury varies from death within a few days or weeks, in five cases; fracture of skull, broken arms, ribs, and legs in a number of cases; scalp wounds and burns, that disabled the victim for weeks and days, to slight bruises that in a few cases did not disable the injured to continue his work. Permanent incapacity resulted in several cases, through the fracture of skull, the crushing of an eye, the loss of fingers in several cases, and through electric burns.

During the 12 months covered by this report, there occurred 12 deaths of members of our local union. A large percentage—41.7 per cent—was caused by accident at work. Of these five deaths, one occurred in May, one in July, two in August, and one in September. In one case death resulted within one day, in two cases within two days, in one case the injured lived six days, and in the one case resulting in lockjaw, the records do not state the period elapsing between injury and death.

SOCIAL INSURANCE AND ACCIDENT PREVENTION URGED BY THE GOVERNOR OF MASSACHUSETTS.

In his address to the legislature on its assembly in January, 1918, Gov. McCall, of Massachusetts, repeated his recommendation for some form of health and old-age insurance and also urged the neces-

sity of better accident prevention methods. As regards the need of accident prevention he said:

During the last two years accidents have nearly doubled in number and severity. Reports indicate that since last June the increase has amounted to an even greater degree—due in a measure to the supplanting of old and experienced workers by those who were inexperienced. It has been estimated that more people are now killed and injured in industry in the United States in a four-year period than were killed in battle or died of disease or wounds during the entire Civil War. This wastage of human life creates a heavy and an unpardonable drain in time of peace, but it is even more deplorable in time of war. We should increase the safeguards against accidents. There is a great social loss in addition to the individual loss which is suffered. Compensation is a very necessary and beneficent thing, but the prevention of the destruction of the lives and limbs of workers is far better than compensation, which can not restore them again. It is estimated that the economic waste from accidents alone in the Commonwealth exceeds \$15,000,000, every year. I recommend that the legislature carefully investigate this subject, with a view to providing remedial legislation.

He refers to a recent study of the causes of dependency in Massachusetts, showing that dependency in three cases out of four was caused by the death from sickness of the father.

Where the dependency was caused by incapacity instead of death, sickness was again the preponderating cause. The men whose families were thus deprived of support had previously been employed as skilled workmen with good wages, and yet they were unable to make provision against death or serious illness. Life insurance had been sought by many of them, but the amount of the insurance had been totally inadequate—amounting in most instances to but a few hundred dollars—and was largely consumed by expenses of the last sickness and of burial. I believe these facts, and others to be found in the report to which I have referred, should receive the consideration of the general court. They indicate that the illness of our workers is a chief cause of the dependency which costs us great sums of money each year, and that a further cause is to be found in the premature death of productive workmen. A great amount of this staggering loss and the resulting expense might be averted by prompt and adequate medical care, such as a well-organized system of health insurance would supply, and such as it does supply in those countries which have established such a system. As I have said, general legislation should at the present session be undertaken with unusual caution. But the care of the workers has a very special reference to our efficiency in war. Their labor becomes all the more necessary, for the struggle is not merely between men, but between the productive forces of the nations.

It is especially important, the governor urges, to conserve the health and strength of the women workers who are replacing men in so many industries—

if we are to avoid the costly mistakes made by some of the nations during the earlier years of the war.

The places left in our social order by the men who have entered the military service must be taken by others, who in the first instance require training and are particularly subject to accident. We should not permit our in-

dustrial life to slacken. The farms and mills and factories which are essential to our strength should be kept producing at full capacity. Good authorities declare that for every man on the battle front seven are required at home to keep him an effective fighting unit. No subject can better engage your attention at a time like this than that which relates to the conservation of the human resources of the Commonwealth and the preservation and the efficiency of her men and women. A comprehensive system which would so far as possible do away with the waste resulting from accident and sickness would be a wise, humane, and beneficent measure. It would strengthen the hands of the country in war, and would result in the saving of very many millions of dollars each year to the Commonwealth. At the last session the committee of the legislature which considered my recommendations for health and old-age insurance were of the opinion that the advent of the war, after I had made my recommendations, made it advisable, as a measure of present economy, to adjourn their consideration. That view would necessitate their further adjournment until the end of the war. I believe firmly in the wisdom and justice both of health and of old-age insurance, and of the inevitableness of their coming. Very much is to be said in favor of both even in war time, and especially in favor of the immediate conservation of the health of our workers.

HOUSING AND WELFARE WORK.

ESTABLISHMENT DISABILITY FUNDS, PENSION FUNDS, AND GROUP INSURANCE FOR EMPLOYEES.

BY ANICE L. WHITNEY.

A study of the costs, management, benefits paid, etc., of establishment and trade-union disability funds was made by the Bureau of Labor Statistics and the results summarized in the MONTHLY REVIEW for August, 1917.¹

In this article, which relates to the 431 establishments which were visited in connection with the study of industrial betterment, only those funds to which the employers make substantial contributions are considered. Many establishment funds were reported in which the only help extended by the firm was the use of a room for meeting purposes, some slight clerical assistance, or the promise of financial aid if a deficit should occur. These associations have been excluded from the report as being practically independent organizations. The details asked for in the study of industrial benefit associations were the percentage of the expenses paid by the different firms, the amount of dues brought to a monthly basis, the amount of the weekly sick and accident benefits and of death benefits, the number of sick, accident, and death benefits paid, and the amount paid out in benefits in the last fiscal year.

Of the 431 establishments visited, 80 reported benefit associations which come within the foregoing requirements. The number of employees in 78 of these establishments was 673,095; two establishments failed to report the number of employees. Fifty-eight of the establishments, with 617,342 employees, reported on the association membership. In these 58 associations the membership was 550,177, or 89 per cent of the total number of employees. This is a high percentage, since in 15 of these establishments a period varying from 2 weeks to 6 months must elapse, after employment, before the individual is eligible for membership. In 12 plants membership in these societies is made a condition of employment, 16 failed to report, while the remaining 52 report that there is no rule which compels employees to become members of the association. There is no doubt, however, that in some of the establishments, while there may not be a rule to this effect, yet indirectly there is strong pressure brought to bear upon employees to become members. The following table shows, by industries, the number of associations, the membership, the classified dues and benefits, and the percentage of

¹ Operation of establishment and trade-union disability funds, by Boris Emmet. MONTHLY REVIEW for August, 1917, pp. 17-36.

expenses contributed by the companies. The employees of all plants of one company in the telephone and telegraph industry have been shown in this table, since the data furnished relates to all and not simply to those places visited as in other sections of the study.

1 Not including employees of 2 establishments, not reported.

2 No dues.

3 Including employees of all plants of one company.

4 Including 8 associations in which no dues are charged.

As will be seen, the proportion of the expenses of the associations assumed by the employers varies considerably, although as already stated those companies which contribute only a negligible amount have not been considered. One company, which pays \$12,500 annually, stipulates that an average membership of at least 50 per cent of the employees shall be maintained. Another company, in addition to its contributions to the benefit association, has provided a fund of \$25,000, from the proceeds of which it cares for employees who are not eligible to join the benefit association. Still another company, not included in the count, has a fund of \$1,000,000, the income from which is used in paying accident and sick benefits. This company follows no set plan in making the awards, but considers each case on its own merits, the chief factors in determining the amount awarded being length of service and the necessities of the case.

MANAGEMENT OF ASSOCIATIONS.

The management of the benefit associations is participated in largely by employees. For those companies which reported on this subject there were 34 associations which are managed jointly by the companies and their employees, although in four of these the companies really retain control of the management, since a majority of the association officers are company officials. Fifteen associations are managed by the employees alone, in several of these the company contribution being as much as 50 per cent of the benefit fund. The eight funds which are financed entirely by the companies are, of course, administered and controlled by them. There are six funds to which employees contribute, in the management of which they have no voice.

PHYSICAL EXAMINATIONS REQUIRED FOR MEMBERSHIP.

Usually in the large organizations physical examinations are reported as a requisite for membership. A fee of 50 cents or \$1 frequently is charged for this examination. In several instances the company emergency hospitals are managed by the benefit associations, and in some others the regular dues of the association cover a certain amount of medical attention. One mining company has turned over its two hospitals, equipped at a cost of about \$10,000 each, to the association, which furnishes medical attendance to the members and their families. One association has a provision, recently added to its rules, that \$100 in addition to other benefits shall be paid to any member who must undergo an operation.

LENGTH OF MEMBERSHIP REQUIRED BEFORE ELIGIBLE FOR BENEFITS.

The length of time which must elapse after becoming a member before one is eligible for benefits in the various associations is not reported by 37 of the organizations. Thirteen associations pay benefits immediately; 5 have waiting periods of five, fifteen, or twenty-one days; 12 of four weeks; 2 of 2 months, and 2 of three months, and only 1 has a waiting period of six months. In a few cases there is a longer period of membership required before death benefits are paid than is required for payment of sick and accident benefits. One association in which membership is compulsory has a waiting period of four weeks before one is eligible for sick benefits, and three months before death benefits are paid.

It is generally necessary for the employees of those companies which furnish the entire amount of the disability fund to give a longer period of service before they become eligible for sick benefits and before payment is made for death from sickness than is required in those associations which are partly financed by the employees. Two of the eight companies which maintain such funds did not give any information on this question. One company pays sick benefits after 30 days' service, and death benefits after 1 year, though these benefits do not apply to anyone receiving \$1,800 or more a year. Another of these companies makes employees eligible for sick and accident benefits during the second six months that they are employed, with compensation amounting to full pay for four days and half pay for eight days, the benefits increasing gradually in amount up to 15 years' service when full salary is paid for one month and half salary for six months. Death benefits are paid after six months' service. Three of the companies require one year of continuous service before sick benefits are paid. The one remaining company does not provide in its plan for any benefits for sickness under two years of service, but quite generally the plan has been supplemented by provisions for payment during the first seven days of absence for those employees of two years' service or more, and for payments after the first eight days of disability to employees of less than the required two years' service. These supplemental payments are being gradually systematized. Payments under the disability plan are graded according to length of service. Benefits for death from sickness are not paid to dependents except for five years or more of continuous service. This company which is a great public utility whose business extends over a large portion of the United States pays accident benefits from the date of accident even in those States in which there are as yet no compensation laws for workmen.

TIME BETWEEN BEGINNING OF DISABILITY AND PAYMENT OF BENEFITS.

The necessity of guarding against the feigning of sickness or the making of slight illness an excuse to be absent from work is undoubtedly the reason that so large a proportion of the associations do not pay from the beginning of sickness. Many of these associations which do not pay from the first in cases of sickness do, however, pay from the date of injury in accident cases, since the risk of malinger in cases of injury is not so great. Eighteen of the associations do not report the number of days intervening between the beginning of the disability and the payment of benefits. In 9 instances benefits are payable from the first day; 9 pay after three days; 2 each after four, five, and six days; 33 pay after seven days, and 1 each after ten days and fourteen days. One association pays from the first if the sickness lasts more than three weeks, another has a seven-day waiting period unless disablement lasts more than fourteen days when payment is made from the first, and still another pays nothing if disability lasts less than a week, but pays from the first if it lasts longer.

The maximum time for which benefits are paid in any twelve months is reported in all but nine cases. Seventeen associations pay benefits for a period of three months, 14 for six months and 12 for one year, the remaining associations paying for various fractions of a year. In one association those employees who have been members of the society for ten, fifteen, or twenty years may draw benefits, if necessary, for two, three, or four years, respectively. Several associations pay benefits for a longer period for injury than for illness.

INITIATION FEES.

The majority of the associations do not charge an initiation fee, only 20 of the 78 associations reporting that this is a requirement for membership. These fees vary from 25 cents to \$2, the usual fee being \$1. The entrance fee in four societies varies according to the different classes of dues, and in one depends upon the age of the applicant.

It might be expected that charging a substantial initiation fee, especially if there were a fairly large turnover, would have the effect of reducing the monthly dues or of increasing the benefits paid, but this does not seem to be borne out by the figures as reported. One of the associations, which has a membership of over 15,000 and which charges a fee of \$2, reports the monthly dues to be 50 cents, and the benefits but \$5 a week for a period of 27 weeks. In this association the company pays 20 per cent of the dues. In the other associations, which charge a fee of one or two dollars, if there is a reduction in the

dues or an increase in the benefits over these figures, it seems to be due to the fact that the company pays a much larger percentage of the expenses of the association.

FORFEITURE OF MEMBERSHIP.

In nearly all cases membership is forfeited upon leaving the employ of the company, but several associations provide that employees upon terminating their connection with the company shall be paid benefits, which they may be receiving at the time, until recovery or until the expiration of the time to which they are entitled to them. In two associations, members on leaving the employ of the company may retain their association membership by vote of the board of directors. In another association, if the person remains a resident of the town and is a member in good standing at the time of leaving, or if he is a pensioner of the company, membership may be retained, while still another allows an employee who has been a member for 10 years and who does not engage in other business or occupation to retain death benefits for himself and wife by paying the regular dues.

The variation in the length of time which elapses between the beginning of the illness and the payment of benefits in the various associations results in a great difference in the proportion of employees receiving benefits and is also an important factor in the cost of the scheme since a waiting period of from 7 to 14 days excludes a large proportion of the cases.

The following table shows the establishments which reported the sick, accident, and death cases and the amount of benefits which were paid during the fiscal year of each association preceding the date of the schedule covering the association:

NUMBER OF BENEFIT CASES AND AMOUNT OF BENEFITS PAID BY ASSOCIATIONS, BY INDUSTRIES.

6 Including accidents for 7 associations.

7 Not including accidents for 7 associations; included in sickness.

The benefit associations have been affected in recent years in many of the States by the enactment of workmen's compensation laws and in the majority of cases the by-laws of these societies have been amended to exclude cases of injury incurred in the course of employment. Since the majority of these laws do not provide for payments for injuries the disability from which lasts less than two weeks, many of the associations provide for payments for this intervening period. In a number of instances, also, where the compensation laws have been less liberal than the provisions of the benefit associations for disability from industrial accidents, the employers have voluntarily assumed the larger payments. A number of companies also which do not contribute to the associations and which have not been included in the statistics, pay a death benefit to the dependents of employees, usually stipulating a certain length of service as prerequisite to the payments.

PENSIONS.

The establishment of a definite pension system has been a comparatively recent manifestation among employers of the belief that the worker has a just claim on those for whom he works for some provision for his declining years. It is probably true, however, that while the majority of the plans state that the pensions are granted for "loyal and efficient" service, still the fact that the provision of these funds tends toward a more stable force, toward keeping the services of the more experienced and skillful workmen who might be able to command higher wages elsewhere, and toward moderating industrial unrest generally, has its weight also in determining firms or corporations to establish such funds.

There were 75 establishments of those visited, with a total of 1,101,500 employees, which maintain pension funds and which have a definite plan which is followed in the granting of old-age allowances. The conviction that it is both desirable and necessary to provide for the many workers who are unable for various reasons to save enough to care for themselves in old age seems to be growing among employers. Of the 66 funds for which the date of the inauguration of the plan was given, 32 were established in the years 1913 to 1917, 20 were established from 1910 to 1913, while only 14 were established previous to 1910.

The following table shows, by industries, the number of establishments having pension funds and the number of employees on pension rolls, and the amount paid out in pensions during the fiscal year preceding the date of the schedule covering the establishment. The employees of all plants of one company in both the iron and steel

and the telephone and telegraph industries have been shown in this table since the data furnished relates to all and not simply to those places visited as in other sections of the study.

NUMBER OF PENSION FUNDS, NUMBER ON PENSION ROLLS, AND AMOUNT OF PENSIONS, BY INDUSTRIES.

³ Not including 4 establishments, not reported.

⁴ Not including 2 establishments, not reported.

CLASSES OF EMPLOYEES ELIGIBLE FOR PENSIONS.

In general the pension plans apply to all grades of employees, but there are four which exclude officials and directors, four which exclude salaried employees whose yearly earnings exceed amounts varying from \$1,500 to \$5,000, and only one which does not include the factory force. This company has about 11,000 employees, and since the plan covers only those in the office it necessarily debars from participation in its benefits many of those employees who most need such assistance. This seems to be true in a measure of all industrial pension plans since the lower paid and more unskilled class of workmen are less likely to give the continuous service necessary to the granting of a pension, and, if they do, in those cases where no minimum is established the amount is so small as to be of little practical help to the recipient. A case in point is that of one company which has on its pension rolls men receiving as little as \$3 per month.

EMPLOYEES' CONTRIBUTIONS TO FUNDS.

The majority of the funds are supported and managed exclusively by the companies. Only four of them require contributions from employees. Three of these assess the employees 3 per cent of their

annual pay, and one assesses them 2 per cent, the amount contributed being returned without interest if the employee leaves the service of the company, although one firm pays 4 per cent interest if the employee is dismissed. The amount, exclusive of the initial fund, set aside by the companies each year for the maintenance of these funds, is usually a certain per cent, most frequently 1 per cent, of the total annual pay roll, or it may be a sum aggregating the amount of the pension allowances or the interest from trusts or other funds which may have been provided.

GENERAL RULES AND REQUIREMENTS.

There is a very decided similarity in many of the regulations governing the payment of pensions. The acceptance of a pension in nearly all cases does not debar the one receiving it from engaging in other work which is not prejudicial to the interests of the company. Usually a temporary absence due to illness or a reduction of the force is not counted in computing the length of service unless it exceeds six consecutive months, and most of the companies allow a break of one or, in most cases, two years in the continuity of service. Assignment of pension allowances is never permitted nor are the pensions subject to attachment for debts of the beneficiaries. Pensions are forfeited usually because of misconduct on the part of the pensioner or at the discretion of the pension board. The maximum employment age in most cases, for those reporting, is 45 years, but sometimes for inexperienced workers this limit is placed at 35 years.

The usual ages at which male employees are retired are 60, 65, and 70, by far the largest number of companies fixing this age at 65 years. For women the average retirement age is about five years less than that of men, although there are several cases where they do not become eligible for pensions before reaching the age of 70. The usual number of years of continuous service requisite to the allowance of a pension is 20, although the requirements in this regard range from 10 to 40 years. Many of the companies have several classes of service requirements, those employees with the longest required period of service to their credit being retired at an earlier age. Pensions for cases of total disability are given at the discretion of the company in many cases; in others a service period varying from 10 to 30 years is a requirement of the pension rules.

A minimum pension allowance is fixed by about half of the companies. In two cases this amount is as low as \$5 a month, but the greater number fix the lowest amount paid at \$18 or \$20 a month. The method of determining the amount of the pension is much the same in the majority of cases, the most usual method being to compute the pension on the basis of the earnings for a certain period of

years. The required number of years of service and the percentage of the earnings are fairly uniform in the different establishments.

SPECIAL ALLOWANCES.

There are 53 firms which reported that while they have no pension fund or system of caring for aged employees, still provision is made for deserving cases. In several instances quite a number of persons are thus cared for, but while this may be a liberal arrangement on the part of the firm, there can be no certainty on the part of the employee that it will be continued and there is also the feeling that it is a gratuity instead of the "deferred wages" to which the employee may feel himself entitled because of his long and faithful service.

The chief objection to industrial pensions as now administered is not in the amount of pensions allowed, which in most cases is fairly liberal, but in the element of uncertainty which results from the fact that the firms universally stipulate that the establishment of such a fund does not form a contract, and that the right to discharge an employee is not affected by the length and character of the service he has rendered. There also can be no assurance to the employee that the firm may not be dissolved and that the assistance which he has confidently expected in his old age may thus be denied him.

GROUP INSURANCE.

One of the most recent evidences of the interest employers are taking in their relations with their employees is found in the growth of the group insurance idea. As in the case of the pension plan, it undoubtedly works toward more harmonious relations and toward the reduction of the labor turnover since it offers a strong inducement to employees to remain with the firm. Individual life insurance is too expensive to be within the reach of most workmen. The guaranty that, in the event of death, a sum will be paid which will be adequate to care for the family during the adjustment to the changed conditions and responsibilities must appeal strongly to that class of workmen who are unable to save anything toward the future and to those also who have reached an age where the rates would be greatly increased or who would be unable to pass the necessary physical examination.

CONDITIONS UNDER WHICH GROUP INSURANCE CAN BE PROVIDED.

The group plan can be offered to firms by the life insurance companies at greatly reduced rates since it does away with the medical examination and much of the usual expense incidental to the selling

of life insurance. In order to secure a satisfactory rate from the insurance company, the employer must offer conditions of employment which measure up to a certain standard. The occupations must not be extrahazardous, sanitary conditions generally must be good, and good drinking water must be supplied. This does not offer an obstacle in the case of most firms, for the ones most likely to wish to introduce such a plan are those which have already progressed far toward safeguarding the plant and providing good working conditions. It is evident, too, that the elimination of medical examinations is made possible through the physical examination on entrance which many companies require and through the work of the emergency hospital departments in caring for the health of employees, which results in lowering the number with serious diseases and maintaining the general health of the force at a high standard.

METHOD OF INSURANCE.

The method of insuring is to issue to the company a blanket policy which covers the entire group to be insured. The insurance company has a list of the employees included, with the age of each and the amount for which each is insured. A certificate is given to each individual, which names the beneficiary, the amount of insurance, and also gives the conditions under which it will remain effective. Naturally the employee's eligibility to the plan ceases upon leaving the employ of the company, but several of the plans allow the employee to continue his insurance at the regular rates, about the only advantage being that he does not have to take the medical examination, with perhaps the consequent increase in the premium.

COST AND SCOPE OF INSURANCE PLANS.

There were 32 firms, with a total of 136,318 employees, which reported that a part or all of their employees had been insured under the group plan. The largest number of these plans cover all employees, but some limit the plan to include those with a stated length of service to their credit. This service is for periods varying from 30 days to 2 years. One large company had insured as yet only its day laborers of one year or more of service, although it was planned to extend the insurance to other groups as fast as possible. Three companies make eligibility for life insurance contingent upon membership in the relief association, and still another company insures all below a salary of \$4,000. One company, which insures only foremen and clerks, has an endowment feature which takes effect upon the employee reaching the age of 65.

Most of the companies pay the entire cost of the insurance scheme, but two of the companies pay 50 per cent, and another pays all after

five years' service, while those in the employ of the firm from one to five years are assessed according to their length of service. This had not worked out very satisfactorily, as those to whom it was free were ready to avail themselves of it, but comparatively few of the others had done so. One company which pays half of the costs has insured under the "term" plan. This differs from the ordinary group plan in the respect that the policy is renewed each year and that the premium increases from year to year as the employee grows older. The plan of this company, as well as of several of the others, carries a disability clause, agreeing to pay for total disability incurred before the ages of 60 or 65 are reached. Only one company is reported as making a rule that joining a labor union or participating in a strike invalidates the claim for insurance benefits.

CONCLUSION.

The plans in force vary somewhat in the extent of the provisions. Probably the most equitable and most satisfactory in its working out is one where the equivalent of one year's salary or wages, with of course a maximum limit, is paid in installments. This takes into consideration automatically any change in the employee's wages and provides for the family a year's income on the same basis to which they have been accustomed. This plan has been adopted by a number of the companies. Several of the plans provide for the payment of a fixed sum, these sums varying in the different establishments from \$200 to \$1,000, and still others for the payment of sums varying with the years of service until the maximum is reached, which is \$1,000 in most cases, but which is as high as \$2,500 in several instances.

The benefit, pension, and group insurance plans which have been outlined in this article, in so far as they tend toward the amelioration of the economic conditions under which the ordinary workingman struggles, are, it seems probable, steps toward the ultimate goal of better understanding and more cordial relations between employers and their employees.

FEDERAL HOUSING.

The problem of housing the large labor supply at the shipyards under the control of the United States Shipping Board has been under active discussion since last summer. The section on housing of the committee on labor of the advisory commission of the Council of National Defense first took it up, made a hasty survey to ascertain the house shortage at munitions and shipyard centers in August, 1917, called a conference of experts on August 30, held a meeting in Wash-

ington on September 21, and laid a report before the committee on labor detailing its activities and summarizing the results of its housing survey. As a result of the activities of this committee, the War Industries Board of the Council of National Defense appointed a special housing committee with Mr. Otto M. Eidlitz, of New York City, architect and builder, as chairman. Hearings were held in Washington during September, 1917, and a report submitted to the Council of National Defense containing recommendations for a Federal housing program.¹ The principal features of the proposed program were these:

(1) Giving of financial aid to such industries or communities as can clearly demonstrate their right to relief, preferably in the form of loans at a low rate of interest; (2) creation of an organization of reasonable permanency and authority having broad power to conduct building operations, to deal in real estate, and to borrow and lend money; (3) distribution of future contracts for war material in such manner as to prevent undue concentration of workers in any locality.

The committee emphasized the condition that Government aid for industrial housing should be considered as a war measure and be rigidly confined to cases where restriction of output of war materials would otherwise occur.

The committee has continued its work and drafted a clause for insertion in some appropriation bill for securing an allotment from Congress to permit the acquisition of land and the erection of houses for shipyard and munition workers where, in the opinion of the President, such action would be necessary for the national defense and security.

The United States Shipping Board has also had under consideration the housing problem. Several outside experts have had consultation with the board and the employment division of its Emergency Fleet Corporation has looked into the welfare aspects of the problem. The following letter written to the chairman of the Senate Committee on Commerce by the chairman of the United States Shipping Board concerning the interest of the board in the housing problem appeared in the Official Bulletin of January 2.

One of the most perplexing problems of the war to the United States Shipping Board, the Army, and the Navy has been the lack of housing facilities for the enormously increased army of labor. The War Industries Board appointed a committee on housing, with Mr. Otto M. Eidlitz, of New York, as chairman, to investigate and advise on this situation. This committee has investigated and advised on the immediate necessity of increased housing facilities, but owing to the fact that this problem had not yet reached a critical stage at the time

¹ See MONTHLY REVIEW for December, 1917, pp. 218 to 220.

Congress adjourned at its last session, and that no request had been made to Congress for an appropriation to provide necessary housing. Mr. Eldlitz was unable to do more than suggest. The Shipping Board also had appointed an advisory committee which thoroughly investigated housing conditions at the shipyards and recommended some action toward relieving the situation, but all committees were more or less handicapped by no special financial provisions for taking care of this unlooked-for situation.

In November I appointed Mr. J. Rogers Flannery to see what could be done to help the housing troubles at the shipyards. The demand for immediate action became so apparent when the situation was thoroughly investigated that the Shipping Board decided to start construction at once at the most critical points. Hog Island will be the largest operation and \$10,000,000 has been set aside for the erection of thousands of houses to be erected in the vicinity of the Hog Island shipyard. Bristol, Pa., has also been assisted, and a large community site is being constructed.

Sparrows Point, Md., has been in need of housing facilities, and the Shipping Board is helping the Bethlehem Shipbuilding Corporation (Ltd.) to purchase about 400 five and six room brick houses to care for the shipyard employees. Baltimore, which is about 10 miles from the shipyards, is cooperating with the United States Shipping Board to the fullest extent and is giving invaluable assistance in helping to place the shipyard employees in homes, rooms, and apartments.

Chester, Pa.; Wilmington, Del.; Newport News, Va.; Newburgh, N. Y.; and many other shipbuilding points are being investigated and plans are under consideration for alleviating the housing situation.

We are treating the housing proposition from a very broad viewpoint, and in all cases where community sites are being planned are providing all the social, moral, and artistic features that will add to the social, moral, and physical well-being of the shipbuilding employees who will live in these communities. While protecting the investment of the Government, we are also adjusting the rents, purchase terms, etc., on such a basis that they will be within normal reach of the men who will occupy the houses.

The Shipping Board has invited the committee on housing to act as its advisory committee, has provided quarters for and is paying all salaries and clerical expenses of this committee and is attempting to work out this housing problem along the very broad lines that it deserves, hoping that eventually Congress will realize the necessity of providing the necessary appropriation with which to take care of the housing necessities of all branches of the Government. The Shipping Board is building up this housing organization in conjunction with the committee on housing so that no time may be lost, and when Congress decides to appoint an independent housing commission with the necessary appropriation to take hold and construct the necessary housing for all branches of the Government, standard town plans will have been laid out and standard types of houses that will permit of standard dimension parts and standard materials will have been decided upon. Everything will be ready. All preliminary foundation work will have been completed. Immediate action can be assured.

About \$35,000,000 will be required to carry out the contemplated housing program of the United States Shipping Board. A very considerable amount will also be required by the Army and the Navy. A bill is being prepared by the housing committee of the Council of National Defense, and I hope that it will be favorably acted upon by Congress, providing finances for the necessary

housing. Housing facilities must be obtained for the large army of labor that must live where the Government's operations are being conducted on such an enormous scale, and should be coordinated and standardized in one commission for all branches of the Government.

The bill (S. 3389) referred to in the above statement was introduced in the Senate on January 5, referred to the Committee on Commerce, amended, and passed by the Senate on January 18. It is now before the Committee on the Merchant Marine and Fisheries of the House, where hearings on it are being held. This bill gives the United States Shipping Board Emergency Fleet Corporation power to purchase, requisition, or condemn any improved or unimproved land for housing purposes for the use of employees in Government owned or controlled shipyards. All necessary powers for maintenance and repair of properties acquired are also granted. The corporation has power to sell or rent houses to employees. Expenditures under its authority are not to exceed \$50,000,000.

The corporation will fix the prices which it will pay for any property acquired, the seller, however, having the right to appeal to the court for additional compensation if dissatisfied with the valuations of the Emergency Fleet Corporation. In fixing the price to be paid for acquired property, the bill contains no provision respecting the method of valuation, whether the land should be purchased at prewar values or at values which may have been created as a result of Government work in the vicinity of a shipyard. The Emergency Fleet Corporation, however, under its price-fixing power, may quite conceivably take such values into consideration, and the courts, in their discretion, may or may not follow the policy of the corporation in that respect.

The powers under the bill will terminate upon the declaration of peace.

Pending consideration of this bill the United States Shipping Board Emergency Fleet Corporation has gone ahead maturing its plans as shown by the above letter, and an actual survey has been in progress on the housing of employees in the vicinity of Philadelphia, particularly at the new Hog Island shipyard on the Delaware River.

A group of several thousand homes to house the workers at the shipyard in question has been projected by the corporation after consultation with its housing experts, the city of Philadelphia, the Philadelphia Rapid Transit Co., and shipyard officials.

Under the plan projected the city and the Emergency Fleet Corporation will share the cost of opening certain streets in one of the southwestern wards of Philadelphia, lay sewers, and make other essential improvements. The homes to be constructed will be permanent dwellings and will probably be of brick.

If necessary, in order to safeguard itself against real estate profiteering, the Government will exercise its power to seize the land if the price asked by the owners is not satisfactory.

As a part of this housing enterprise, the rapid transit company of the city of Philadelphia is planning to extend its lines to connect with the section of the city in question.

COMPANY HOUSING.¹

Rapid labor turnover as emphasizing the difficulty which the employer finds in retaining his men has brought about a situation which requires that the employer should undertake the housing of his workmen. The manufacturer "has long felt that the housing problem is one to which he ought to give serious attention. He has disliked doing so, and for good reason, but the present crisis is forcing upon him the conviction that he has got to tackle it, and that in the future he ought to control it."

In a pamphlet on "Industrial Housing Problems" the author emphasizes the need of practicality in handling housing problems; points out the failure to distinguish carefully in housing matters between skilled and unskilled workmen, low and high paid men; outlines the essentials of a workmen's house; and presents some comparative costs.

Assuming the cheapest construction, wood framing, wood lathed and plastered on the inside and rough boarded and shingled on the outside, as the standard or 100 per cent, the relative costs of various houses would be as follows:

	Per Cent.
Wood framing, inside wood lathed and plastered, outside rough boarded and clapboarded and painted.....	102
Wood framing, inside wood lathed and plastered, outside wire lathed and stuccoed.....	108½
6-inch concrete wall, inside furred and lathed and plastered, outside rubbed smooth.....	112
6-inch concrete wall, inside furred and lathed and plastered, outside stuccoed.....	116
8-inch hollow tile, inside plastered direct, outside stuccoed...	111
8-inch brick wall, inside furred and lathed and plastered....	115½
Wood framing, veneered with 4-inch brick, inside lathed and plastered.....	113

In discussing architectural design the author emphasizes utility and points out the frequent tendency to insist on porches for houses at the expense of sunlight. A layout of streets conforming to the

¹ Industrial Housing Problems, by Leslie H. Allen. Boston, Aberthaw Construction Co. [1917.] 31 pp.

contour of the ground is favored, not only because of the more pleasing effect, but also because of its lesser expense as obviating the necessity of cuts and fills, embankments, and retaining walls. In city development it is considered better to limit the amount of land to the tenant and to use the land that would otherwise be allowed him in the maintenance of parks and playgrounds and allotments for gardening.

For successful company housing the need of large-scale operations is stressed, as well as the need for strict and careful supervision and education of the tenants.

EMERGENCY HOUSING ASSOCIATION OF THE DISTRICT OF COLUMBIA.

The act of Congress approved September 25, 1914 (Statutes at Large, 1913-15, chap. 310) proscribed the erection of new dwellings or the alteration of existing buildings for dwelling purposes in alleys of the District of Columbia, i. e., roadways or passages less than 30 feet wide, and all existing dwellings in alleys were to be demolished or abandoned for dwelling purposes after July 1, 1918.

It is now contended that the enforced evacuation of the houses will work hardship upon the poorer classes of people, mostly low-paid or insufficiently paid wage earners, inasmuch as there is a pronounced shortage of houses in the District of Columbia growing out of the demand for house room for Government war workers. In order to prevent any stay in the enforcement of the law six months hence, an Emergency Housing Association of the District of Columbia has been organized. The object of this association is "to promote in every possible and legitimate manner, the erection of model, sanitary, inexpensive homes for the poor people who will be dispossessed of their present dwellings by congressional action on July 1, 1918." The organization is in the nature of a philanthropic promoter for the organization of a model homes company or for the securing of Government aid to provide homes for these alley people who will be dispossessed of their present dwellings by governmental action. The association has at present about 25 active paying members.

WAR HOUSING IN AMERICA, AND BRITISH PRECEDENTS.

While Great Britain has a large background of experimental legislation in housing, the United States is without such experience. Without the compelling necessity arising from economic conditions our efforts at housing and town-planning reform have been tentative

and have consisted mainly in restrictive as distinguished from constructive legislation.

Practically no positive State or municipal action has been taken for the provision of houses for workmen. This matter has been left to speculative building, philanthropic enterprise, and industrial corporations. All these agencies, however, Mr. Frederick L. Ackerman, of the American Institute of Architects, states, in a reprint of an article in the December number of the *Journal of the American Institute of Architects* (Washington, D. C.),¹ either have failed to solve the problem or at best are only temporary expedients for the solution of the problems of industrial housing.

Mr. Ackerman reviews at length British war-housing precedents. Landlordism and land monopoly in Great Britain have forced upon Parliament a thorough understanding of their retarding effect upon industry and housing particularly, and in its war-housing program provision has been made for absorption of the unearned value of land arising from the establishment of munition plants and housing developments connected therewith. During the war at least and as long as the Government is in possession of land taken over for the purposes indicated, no compensation will be paid for land values created by governmental operations.²

A second feature of the British program has been the development of town-planning principles and their acceptance as fundamental to real housing reform. There is, too, a general movement against the tenement as a permanent institution, "and the program of progress in England looks forward toward its complete eradication."

Finally, in the background of British housing experience lies the garden city movement, the aim of which is the dispersion and ruralization of the population. Furthermore, with the garden city movement has been developed experience in cooperative enterprise. The so-called public utility society, which is the organizing agency of the garden city or garden suburb, has, as its central idea, the substitution of the principle of ownership of shares in a company for the personal ownership of the individual home. The shares carry with them the right of tenancy of the house and call for collective responsibility in the management of the whole estate, whereas the system of personal ownership of the house does not necessarily carry with it responsibility for the condition of the surrounding estate.

Certain political institutions in England have also favored housing reform. The Local Government Board has given direction and

¹ Ackerman, Frederick L.: *What is a House?* *Journal of the American Institute of Architects*, Dec., 1917.

² See also article on "War housing in Great Britain" in the December, 1917, issue of the *MONTHLY REVIEW*, p. 220.

greater unity to the house-building schemes of the municipalities by the exercise of its power in sanctioning loans to these authorities.

With this precedent of State control and direction and the use of public money for the purpose in question, it has not been a far step for the Government to take direct initiative in the building of emergency and permanent housing for war purposes. Such a step, too, was necessary to increase materially the amount of housing accommodation. For, while the experience in housing by local authorities may have been valuable as an example, it has not sufficed to meet the housing shortage. Local initiative has proved relatively futile, so much so that "the opinion was practically unanimous in favor of State initiative, State construction, and State operation."

The United States, lacking all this background, is in a position, however, to profit by this British experience of "collective ownership and administration," "collective regulation," and "collective provision," quoting the writer. Such a policy "we should adopt and put into immediate execution." This American program, Mr. Ackerman has conceived of as follows:

By all odds, the most important consideration in home building during war or during peace is the land problem. We should secure land for industrial housing purposes by precisely the same methods as were used by the British Government. This includes the safeguarding of adjacent areas by a provision which will enable the Government at a later date, during the war, to secure property for the expansion of an operation at prewar costs. Incorporated and as an essential feature of our scheme, should be a provision whereby the unearned increment in the land thus taken by the Government should be preserved so that the income from it will be used for the sole benefit of the community. The conservation of the unearned increment in the land for the benefit of the community is in itself the prime factor in the economic solution of the housing problem.

The Government should organize a separate department or a nonprofit Government corporation for providing the communities adjacent to munition plants wherever it develops that additional accommodations are required. This organization should acquire land under powers as suggested above, plan new villages, install roads, sewer, water, and light, erect houses and other buildings of amenity required by these communities, and it should operate the properties until such time as they may be transferred to others. This organization should cooperate with the various departments of the Government which operate or control plants providing munitions of war. Control of this organization by the latter departments should be limited to a determination as to the extent and the general nature of the building operation. It is important that the management of the civil community should be in charge of a community manager, working under the direction of the central administration, which would in turn frame a general policy of management in cooperation with the department operating the plant.

The entire property, land and buildings, should be retained and operated by the Government during the war and for a certain period thereafter. Future values and conditions can only be determined accurately at a future date. Therefore, when conditions and values have been adjusted, local nonprofit

land companies with limited dividends should be formed to operate the properties—that is, rent houses, operate the utilities, or rent land to private builders or companies—and use the surplus income from rentals to pay interest and amortization of the Government's loan. The important features of this scheme, which is similar to the British copartnership operations in many respects, are that no land will be sold; title will remain in the original company and be handled as a community investment; rentals will be readjusted from time to time like tax valuations; and, since there can be no profit as a result of an increase of land values due to the development of a community, the increase in rentals would provide for the interest, the amortization of the Government's loan, and an income to be enjoyed by the entire community which would approximate twice the revenue which this community would obtain under ordinary conditions and through the ordinary methods of taxation. This method conserves the unearned increment of land values created by the Government's house-building operations. The new communities gradually purchase the underlying lands and the original houses at cost, thus reimbursing the Government.

It may be argued that these new communities may collapse after the war, in which case the Government loan will, of course, be lost, but by extending the period of Government ownership and control beyond the war and by the organization of local land companies in each community to anticipate that danger, other industries may be secured. The chances that such an investment would be a loss are indeed remote. It is highly probable that a well-planned community, organized upon this basis, with provision of adequate homes and communal buildings, would draw industries to it without effort. This suggestion is not one of theory; it would merely be putting into effect, with but slight modifications, the practices in general use in the garden cities and the garden suburbs of England. The advantage of the scheme lies in the fact that we do not have to determine the complex details of ownership and future management at this date; and the success of this method depends solely upon the degree of thoroughness with which these communities are carried out. If they are well planned, well constructed, and well organized, there is not the slightest doubt regarding the future value of the investment.

SYNOPSIS OF THE PROGRAM FOR THE UNITED STATES.

First, create a central body with—

(a) Powers to acquire land under authority equal to that created by the Defense of the Realm Act. The final disposition of property need not now be treated.

(b) Powers to survey needs for housing facilities and to determine, in co-operation with a central priority board, the relative importance of industrial operations.

(c) Powers to design and construct communities where the needs of such have been made evident by the survey.

(d) Powers to operate and manage these communities during the war, and for a few years thereafter, along lines of policy similar to that expressed by what is known as the Copartnership Tenants or Public Utility Societies in England.

(e) Powers to maintain a high standard of physical well-being in munition plants (adopting the standards set by our most progressive industrial corporations) and to organize community activities within the communities thus created.

The second step: Create a commission to study the final disposition of these properties. Such a commission should consider such questions as—

(a) The organization of local nonprofit corporations to manage and develop the communities created during the war.

(b) The saving of the appreciation of land values for the benefit of the community as a whole.

(c) The establishment of that part of the cost which should be written off as belonging to the cost of war.

(d) The basis upon which such communities could be transferred to municipalities, or nonprofit corporations.

By such a method it would be possible to advance immediately upon new schemes, and in the event of a lack of progress upon schemes now under way, such schemes could be taken over by the Government and handled through the central body.

INFANTS' NURSING ROOMS IN FACTORIES OF FRANCE.¹

Under the joint supervision of the minister of labor, the minister of munitions, two physicians, and the committee on female labor, an investigation relative to nursing rooms and crèches in factories employing women was recently made in France, covering the period January to May, 1917.

This investigation dealt exclusively with crèches and nursing rooms especially established for working women employed in commercial and industrial establishments, whether under State or private control.

Owing to the invasion the northern and northeastern districts of the country were not included.

The influence of the war was found to vary in different sections. In some localities it had resulted in the closing of such institutions, while in others many new ones have been established and others are under consideration.

Of the 39 establishments included in the investigation, 38 reported the number of female workers employed as 25,443. The following table shows the distribution of crèches and their importance based upon the number of women employed.

¹ Bulletin du Ministère du Travail et de la Prévoyance Sociale, Aug.-Sept., 1917, p. 341.

NUMBER OF CRÈCHES, BY INDUSTRIES AND CLASSIFIED NUMBER OF WOMEN EMPLOYED.

Number of women employed.	Industries.										Total.
	Food.	Chemicals.	Rubber, paper, etc.	Textiles.	Clothing and cloth.	Hides and leather.	Woodworking.	Metalurgy.	Pottery, glass, etc.	Tobacco and matches.

Total.....	1	4	4	11	2	1	1	16	2	6	138

¹ Not including 1 crèche, established jointly by all furnaces in the commune, not reporting number of employees.

Of the 39 crèches reported, 1 was for infants artificially nursed, 1 for infants nursed at the breast, while 37 were open for the care of both classes of infants. In 16 of the latter rooms were designated for each class, in 18 the classes were not separated, and 3 did not report. There were 619 infants cared for in 37 of these institutions, an average of 1 infant for every 40 female workers and 17 for each crèche.

There were 139 persons employed in the 39 crèches, being an average of 1 attendant for every 4.45 infants. A physician is employed in each of 27, and in 2 of these a midwife is also employed; in 10 the community physician is called in; in 4 the physician is a specialist; 1 is supplied with a physician appointed by the city crèche society; and in 1 medical supervision has not been found necessary. In 16 crèches separate rooms are provided for infants whose health is suspected. In 1 an establishment hospital is maintained to which sick infants are transferred. A majority of the crèches refuse admittance to infants whose health is suspected.

The cost of installing crèches per 100 female laborers ranges from less than 500 francs (\$96.50) to 30,000 francs (\$5,790). Twenty-eight establishments reported the monthly operating expenses per 100 female employees, which ranged from less than 50 francs (\$9.65) to 300 francs (\$57.90).

Monthly wages, which were reported for 108 of the 139 employees, ranged from 30 francs (\$5.79) to 250 francs (\$48.25).

Information as to nursing rooms was received from 16 establishments employing 13,491 females. These had established 17 nursing

rooms for infants. Of these 1 had no infants under its care, and 3 were just beginning to operate. In 13 others employing 12,446 females there were 76 infants cared for, or approximately 1 for every 150 women, and 6 for each room.

Medical surveillance was provided for in 15 rooms. In 3 establishments (4 rooms) isolating wards are provided for those who are sick or whose health is subject to suspicion. No room will receive infants whose state of health is under suspicion. A physician may authorize their admittance, in certain rooms, if the health of other infants is not endangered thereby.

The cost of installation per crib (reported for 10 nursing rooms) ranged from 41 francs (\$7.91) to 1,250 francs (\$241.25), while the monthly operating expenses (reported for 12) per crib ranged from 5.2 francs (\$1) to 112.5 francs (\$21.71). There were 203 cribs prepared in the 12 establishments.

Many establishments reported that young mothers were permitted to bring their infants and leave them at the watch house, sanitation rooms, dressing rooms, infirmaries, stockrooms, etc., and sometimes even in the rooms of the employer's residence. Special privileges are accorded in some cases regarding absence from work for a half hour or more and reporting late for labor and leaving early.

In many cases these privileges are considered sufficient by the workers themselves. Many mothers prefer to nurse their infants at home. In some cases there is marked opposition to the establishment of crèches. Mothers consider their infants better cared for at home, and that they themselves are there better able to secure the rest needed. In one particular instance (Toulouse), because of the unanimous negative response of mothers when consulted, an enterprise already begun was abandoned.

Establishments often object to providing crèches because of night-work, as that necessitates night guards, and because expense of maintenance would be excessive because of the few mothers in employment.

In some industries work is done both in the shop and at home. This is especially true in industries where the employees are almost exclusively females. As a general rule upon marriage the employee becomes a home worker. In Paris many employers express a willingness to establish nursing rooms, but experience has shown that mothers fail to make use of them.

In response to a circular issued by the Chantiers et Ateliers Augustin Normand at Havre and addressed to employers of female workers, it was decided on May 14, 1917, to establish cooperative crèches in those sections where none are in operation. In this scheme each employer is to share pro rata in the expense fund. An anonymous endowment amounting to 100,000 francs (\$19,300) has been placed at the disposal of the city for the establishment of such institutions.

ARBITRATION AND CONCILIATION.

CONCILIATION WORK OF THE DEPARTMENT OF LABOR, DECEMBER 16, 1917, TO JANUARY 15, 1918.

Under the organic act of the department, which gives the Secretary of Labor the authority to mediate in labor disputes through the appointment, in his discretion, of commissioners of conciliation, the Secretary exercised his good offices between December 16, 1917, and January 15, 1918, in 85 labor disputes. The companies involved, the number of employees affected, and the results secured, so far as information is available, were as follows:

STATEMENT SHOWING NUMBER OF LABOR DISPUTES HANDLED BY THE DEPARTMENT OF LABOR, THROUGH ITS COMMISSIONERS OF CONCILIATION, DEC. 16, 1917, TO JAN. 15, 1918.

Name.	Workmen affected.		Result.
	Directly.	Indirectly.	
Strike, Fort Smith Electric Power Co., Fort Smith, Ark.	1,260	7,000	Adjusted.
Controversy, Davis Coal Co., Thomas, W. Va.	1		Do.
Controversy, Dixie Tannery Co., Bristol, Tenn.			Pending.
Strike, electricians, Helena Light & Ry. Co., Helena, Mont.	10	90	Adjusted.
Threatened strike, Chesapeake & Ohio R. R. Co., Richmond, Va.	1,900	30,000	Do.
Strike, Porto Rican American Tobacco Co., San Juan, P. R.	15,000	5,000	Do.
Controversy, Tampa Dock Co., Tampa, Fla.	400		Do.
Strike, Bell Telephone Co., Jacksonville, Fla.	126	40	Do.
Sympathetic strike, Bell Telephone Co., Waycross, Ga.	12		Do.
Controversy, Garfield Smelting Co. and boiler makers, Garfield, Utah.	80	1,800	Do.
Strike, Terry Shipbuilding Co., Savannah, Ga.	620		Do.
Controversy, sheet metal workers, Chicago, Ill.	250		Do.
Controversy, Colorado Midland R. R. Co. and shopmen	100		Do.
Threatened strike, packing houses and retail provision markets, Pittsburgh, Pa.	850	2,200	Do.
Threatened strike, slaughterhouses, New York	400		Adjusted before commissioner's arrival.
Threatened strike, Big Four R. R. Co., boiler makers and blacksmiths, Indianapolis, Ind.			Pending.
Threatened strike, machinists, boiler makers and blacksmiths, Cincinnati, Indianapolis & Western R. R. Co., Indianapolis, Ind.			Do.
Threatened strike, blacksmiths, Cincinnati & Northern R. R. Co., Van Wert, Ohio.			Do.
Strike, packing-house employees, Seattle and Tacoma, Wash.			Do.
Investigation, Northern Iron Co., Port Henry and Standish, N. Y.			Adjusted.
Strike, Gun Metal Products Corp., Brooklyn, N. Y.	30		Adjusted before commissioner's arrival.
Strike, telephone operators, Southwestern Bell Telephone Co., Henryetta, Okla.	39	3,500	Adjusted.
Strike, Great Western Sugar Co., Billings, Mont.	500		Factory closed for season, which automatically disposed of controversy.
Threatened strike, machinists, Oshkosh, Wis., at—			
Challoner Co.	7		Pending.
S. M. Harding Co.	6		Do.
Oshkosh Manufacturing Co.	24	80	Do.
Dobson-Bell Co.	28		Do.
Termott-McMahon Co.	26	40	Do.
Universal Motor Co.	34	50	Adjusted.
Pine Erring Co.	33		Do.
Damber-Kratch Co.	14		Pending.
Threatened strike, street-railway men and electricians, Toledo, Ohio.			Do.

STATEMENT SHOWING NUMBER OF LABOR DISPUTES HANDLED BY THE DEPARTMENT OF LABOR, THROUGH ITS COMMISSIONERS OF CONCILIATION, DEC. 16, 1917, TO JAN. 15, 1918—Concluded.

Name.	Workmen affected.		Result.
	Directly.	Indirectly.	
Strike, Connecticut Electric Steel Co., Hartford, Conn....	30	40	Do.
Strike, box makers and sawyers, Chicago, Ill.....	500	1,500	Do.
Threatened strike, boiler makers, Southern Pacific R. R. shop, Ogden, Utah.	114	700	Adjusted.
Strike, Metropolis Bending Works, Metropolis, Ill.....	190	390	Unable to adjust.
Threatened strike, meat cutters and packing-house employees, Los Angeles, Cal.	600	200	Adjusted.
Strike of common laborers employed by contractors engaged in construction of buildings for Holt Manufacturing Co., Peoria, Ill.	50		(See note.)
NOTE.—Increase of 1½ cents granted and accepted. Men returned to work. Men wanted further increase which company refused, claiming they were now being paid 1½ cents more than prevailing rate in Peoria. Men did not cease their work.			
Controversy, telephone operators, Boston, Mass.....	3,400	8,000	Adjusted.
Controversy, Wyoming Valley Metal Trades Federation and employees, Wilkes-Barre, Pa.	7,000	5,000	Pending.
Controversy, Aluminum Casting Co., Detroit, Mich.....	22		Unable to adjust.
Controversy, Curtiss Aeroplane Co. and plumbers, steam fitters, and electrical workers, Buffalo, N. Y.....	590		Adjusted.
Threatened strike, Wabash R. R.—railway clerks.....			Pending.
Controversy, Kelly Cloak Co., Cleveland, Ohio.....	50	60	Adjusted.
Strike, electrical workers, Casper, Wyo.....			Pending.
Controversy, Chicago, Terre Haute & Southern R. R. Co., Terre Haute, Ind.	450	1,000	Do.
Controversy between Associated Weighmasters' & Scalesmen's Union and United Weigher's Association, New York.			Do.
Controversy, stationary firemen, Lowell, Mass.....			Do.
Controversy, Lincoln Motor Co. and its electricians, Detroit, Mich.	100	500	Unable to adjust.
Controversy, Fairbanks, Morse Co. and its pattern makers, Beloit, Wis.			Adjusted.
Strike, Southern Bell Telephone Co., Princeton, Ind.....	15		Unable to adjust.
Controversy, American Steel Foundry Co. and its iron molders, Granite City, Ill.	86		Pending.
Controversy, Florida East Coast R. R. Co. and its shop employees, St. Augustine, Fla.			Do.
Controversy, electrical workers, Pittsfield, Mass.....			Do.
Controversy, telephone operators, Little Rock and Pine Bluff, Ark.			Do.
Controversy, Manitowoc Shipbuilding Co., Manitowoc, Wis.			Do.
Controversy, Chicago, Peoria & St. Louis R. R. Co. and its mechanical force, Springfield, Ill.			Do.
Controversy, Maney Milling Co. and stationary engineers, Omaha, Nebr.	2	20	Adjusted.
Controversy and strikes, dyers, Philadelphia, Pa.: Piece dyers.....	80		Pending.
Skein dyers, mercerizers and helpers, etc.....	3,000		Do.
Controversy, C. B. & Q. R. R. Co. and car service men, Beardstown, Ill.			Do.
Controversy, Scholl Manufacturing Co. and metal polishers, Chicago, Ill.			Do.
Controversy, Dayton Steel Foundry Co. and its molders and car makers, Dayton, Ohio.	25		Do.
Controversy, Pa. R. R. Co. and carmen, Columbus, Ohio.			Do.
Controversy, Toledo Shipbuilding Co., Toledo, Ohio.....			Do.
Controversy, Oregon-Washington R. & N. Co. and clerks, Portland, Oreg.			Do.
Controversy, Alexander Hat Co., Reading, Pa.....			Do.
Controversy, General Electrical Co., Schenectady, N. Y.			(See note.)
NOTE.—Employees of General Electric Co. resumed work on advice of president of International Molders' Union.			
Controversy, Allyn-Ryan Foundry Co. and pattern makers, Cleveland, Ohio.			Pending.
Controversy, Delta Electric Co., Marion, Ind.....			Do.
Controversy, Local Union, No. 11, heat and frost insulator workers and employers, Baltimore, Md.	38		Adjusted.
Lockout, Dowman Dozier Co., Atlanta, Ga.....			Pending.
Controversy, Busch, Diesel, Sulzer Manufacturing Co. and pattern makers, St. Louis, Mo.			Do.
Controversy, Clark Bros. Co. and molders, Olean, N. Y.			Commissioner reports no controversy exists.
Controversy, Nash Motor Co. and pattern makers, Kenosha, Wis.			Pending.

The following cases, noted in the statement of December 14, have been disposed of—

Strike, machinists, American Woodworking Machinery Co., Aurora, Ill. Adjusted.

Threatened strike, Emmonds Coal Co., Bayard, W. Va. Adjusted.

Controversy, firemen, Passaic and Garfield, N. J. Unable to adjust.

Strike, clerks and freight handlers, Norfolk, Va. Adjusted.

Strike, Lake Torpedo Boat Co., Bridgeport, Conn. Adjusted.

Strike, piano and organ makers, Lyon & Healy Co., Chicago, Ill. Factory operating and strikers practically all employed elsewhere.

Strike, street-car employees, St. Paul and Minneapolis, Minn. Adjusted.

Strike, jewelry workers, Chicago, Ill. Union called strike off and urged men to return to work.

Controversy, Utah Light & Power Co., Salt Lake, Utah. Adjusted.

Controversy, machinists, Swift Packing Co., East St. Louis, Ill. Commissioner learned that men had secured work elsewhere.

Threatened strike, packing industries, Chicago and entire West. Adjusted.

Strike, shell shop employees, Pollak Steel Co., Cincinnati, Ohio. Adjusted.

Controversy, Michigan Central R. R. Co. and its machinists, boilermakers, and blacksmiths, Detroit, Mich. Commissioner reports machinists' controversy adjusted; boilermakers and blacksmiths, pending.

Strike, street-railway employees, Charleston, W. Va. Adjusted.

Controversy, A. G. Cuthbert Co., Chicago, Ill. Adjusted.

Threatened strike, electrotypers, Boston, Mass. Adjusted.

Controversy, Chicago, Rock Island & Pacific R. R. Co., Rock Island, Ill. Adjusted.

Strike, shirt manufacturing industry, Mahanoy City, Pa. Adjusted.

Controversy, Tintic mine owners and employees, Eureka, Utah. Adjusted.

Controversy, International Arms & Fuse Co., Bloomfield, N. J. Adjusted.

Controversy, meat cutters, Kansas City, Mo. Adjusted.

IMMIGRATION.

IMMIGRATION IN OCTOBER, 1917.

The number of immigrant aliens admitted to the United States during the year 1916 was 355,767, as compared with 258,678 for the year 1915, an increase of 97,089, or 37.5 per cent. There was also an increase from month to month during 7 of the 12 months in 1916. During 1917 the figures for the first three months show a considerable decrease from month to month. The decrease from the preceding month for January, February, and March, 1917, is 19.9, 22.3, and 19.4 per cent, respectively. For April, however, the number of immigrant aliens admitted shows an increase of 32.3 per cent over the number admitted in March. As compared with April, the figures of May show a decrease of 48.9 per cent. The figures for June indicate an increase of 5.5 per cent over those for May. During July immigration reached a very low point, only 9,367 immigrant aliens having been admitted, a total even smaller than that for May, which was the smallest total for any month in many years. As compared with figures for July, however, those for August show an increase of 7.3 per cent. In September the number fell to 9,228, or 139 smaller than the number admitted in July. As compared with August the figures for September show a decrease of 8.2 per cent. In October there was an increase over the September arrivals of 57, or 0.6 per cent. These facts are brought out in the following table:

IMMIGRANT ALIENS ADMITTED INTO THE UNITED STATES IN SPECIFIED MONTHS,
1913 TO 1917.

Month.	1913	1914	1915	1916	1917	
					Number.	Per cent increase over preceding month.
January.....	46,441	44,708	15,481	17,293	24,745	19.9
February.....	59,156	46,873	13,873	24,740	19,238	22.3
March.....	96,958	92,621	19,263	27,586	15,512	19.4
April.....	136,371	119,885	24,532	30,560	20,523	32.3
May.....	137,262	107,796	26,069	31,021	10,487	48.9
June.....	176,261	71,728	22,598	30,764	11,095	5.5
July.....	138,244	60,377	21,504	25,035	9,367	15.6

PUBLICATIONS RELATING TO LABOR.

OFFICIAL—UNITED STATES.

CALIFORNIA.—*Industrial welfare commission. Bulletin No. 1. Report on the regulation of wages, hours, and working conditions of women and minors in the fruit and vegetable canning industry of California. May 1, 1917. Sacramento, 1917. 176 pp. Illustrated.*

This report is noted on pages 184 to 186 of this issue of the MONTHLY REVIEW.

DISTRICT OF COLUMBIA.—*Report of the Health Officer. 1917. Washington, 1917. 254 pp.*

One section of this report is of interest to labor, namely, that pertaining to the eight-hour law for females. It is stated that during the year ending June 30, 1917, 1,735 establishments came within the purview of this law and that in the execution of the law 11,140 inspections were made. Complaints were received in 109 cases and inspections based on such complaints numbered 112. It is further stated that 9 violations of the eight-hour law for women were referred to the corporation counsel for prosecution and 6 such cases were pending at the beginning of the year. Fines were imposed in 9 cases, amounting to \$160; in 1 case personal bonds were taken; in 3 cases a plea of nolle prosequi was entered; 1 case was dismissed; and 1 case was pending at the close of the year. The cost of enforcing the law is given as \$4,574.67, exclusive of the undistributed cost of supervision.

INDIANA.—*Bureau of Statistics. Sixteenth biennial report for 1915 and 1916. [Indianapolis] 1917. 881 pp. Illustrated.*

Includes a report of the work of the five free employment bureaus, stating that for the year ending September 30, 1916, a total of 21,381 men and women were given employment, an increase of 85 per cent over the preceding year. The disbursements of the five offices amounted to \$8,439.27, making the cost of securing each position approximately 39.5 cents. The private employment agencies, it is stated, have been well conducted during the year. "The abuses formerly so prevalent in this business are now almost exterminated and the agencies are conducting their affairs on a trustworthy basis."

KANSAS.—*Industrial Welfare Commission. First biennial report. From July 1, 1915, to June 30, 1917. Topeka, 1917. 65 pp.*

This report is noted on pages 142 to 145 of this issue of the MONTHLY REVIEW.

MASSACHUSETTS.—*Bureau of Statistics. Collective agreements between employers and labor organizations in Massachusetts, 1916. Labor Bulletin No. 121 (being Part III of the annual report on the statistics of labor for 1917). Boston, 1917. 234 pp.*

Statistical tables show that of 1,354 unions reporting, 764, in 1916, had written agreements, 67 had verbal agreements, and 523 had no agreements; that of the written agreements, 418 were signed or verbally accepted by all employers, 238 by more than half the employers, and 108 by half or less employers; and that the total membership of unions having written agreements signed or verbally

accepted was 171,311, or 71.5 per cent of the total membership of unions reporting.

MASSACHUSETTS.—*Department of Health. Public Health Bulletin, October, 1917. Boston, 1917. pp. 233-256.*

This bulletin briefly reports all cases of anthrax in Massachusetts during nine months of 1917, noting the fact that the increase (39 cases as compared with 31 during 1916) had been coincident with the shipping of hides from new areas in foreign territory with regard to which knowledge as to prevalence of diseases is meager. A table indicates that there were 8 cases in 1908, 7 in 1909, 7 in 1910, 6 in 1911, 11 in 1912, 8 in 1913, 8 in 1914, 11 in 1915, 31 in 1916, and 39 in 1917 (nine months). Six of the 39 cases resulted fatally; one case was pulmonary anthrax, the remainder being external. Thirty-five of the cases were diagnosed as being infected through the handling of hides, 3 from the handling of hair, and 1 from the handling of wool, this diagnosis being confirmed bacteriologically in 25 cases, and "was undoubtedly correct in 7 other cases—a total of 32 certain cases."

NEW YORK.—*Department of Labor. Industrial Commission. Annual report for the nine months ended June 30, 1916. Transmitted to the legislature April 17, 1917. Albany, 1917. 289, 236 pp.*

This report is presented in 10 parts: Report of the commission; report of the legal bureau; report of bureau of inspection; report of bureau of workmen's compensation; report of bureau of mediation and arbitration; report of bureau of employment; report of bureau of industries and immigration; report of bureau of industrial code; report of bureau of fire hazards, boilers, and explosives; opinions of attorney general construing labor laws. There is appendix giving the proceedings of the first industrial safety congress held at Syracuse, December 11 to 14, 1916, an account of which appeared in the MONTHLY REVIEW for November, 1917, pages 169 to 172. The report of the employment bureau shows a total of 33,625 individual orders from employers asking for 49,624 persons, and that of 50,288 persons referred to positions 29,496 (58.7 per cent) were reported as having actually been placed. Of the males reported placed in positions, 35.11 per cent were laborers and 15.55 were agricultural workers; of the females, 36.32 per cent were day workers and 17.15 per cent were domestics. The bureau of mediation and arbitration reported 328 industrial disputes, involving 222,325 persons directly and 31,629 indirectly, and a total loss of time amounting to 9,581,163 days, or an average of about 29,211 days for each strike or lockout. Increase in wages was the principal cause in 270 disputes. About 74 per cent of the days lost was on account of 17 disputes (5.2 per cent of the total) in clothing and millinery trades. The bureau intervened in 96 disputes and was successful in 52.

OHIO.—*Industrial Commission. Bulletin, vol. 1, No. 13, Dec., 1917. A survey of the workmen's compensation insurance field in this country. Columbus, 1918. 93 pp.*

This report contains a survey of the operations of the Ohio State insurance fund. It is issued as a communication to the subscribers to the fund and is an effort to determine the amount the Ohio plan has saved the employers of the State. This saving is computed at \$8,186,942.30 from July 14, 1911, to May 15, 1917. The report further states that for the single year 1917 the Ohio State insurance plan has saved its subscribers, as an absolute minimum, \$5,000,000. The report also contains two sets of comparative insurance rates for practically all risks or classifications. One compares the Ohio rates of March 1, 1912, with those in effect July 1, 1917; the other compares the rates

of eight States (New York, California, Illinois, Wisconsin, Indiana, Michigan, Kentucky, Colorado, and Pennsylvania), which were in effect in 1917.

UNITED STATES.—*Civil Service Commission. Thirty-fourth annual report for the fiscal year ended June 30, 1917. Washington, 1917. xxix, 237 pp.*

States that on June 30, 1917, there were 517,805 officers and employees in the executive civil service, of which number 326,899 held positions subject to competitive examination under civil service rules, an increase of 29,973. The remainder, 190,906, held positions not subject to competitive examination and were divided as follows: Presidential appointees, 12,134; clerks in charge of contract stations, 5,600; clerks in third and fourth class post offices, 71,000; mail messengers, 8,150; star-route, steamboat, and screen-wagon contractors, 12,035; pension examining surgeons, 4,502; Panama Canal work, chiefly as laborers and minor employees, 19,938; unclassified laborers, 33,094; excepted from examination, and classified positions filled upon noncompetitive examination, 24,453. About 35,000 mechanics of all kinds were recruited for arsenals and navy yards through the efforts of the commission's local boards (3,000) of examiners, with the assistance of the United States Department of Labor and the American Federation of Labor. The commission recommends that the minimum entrance salary for stenographers, typists, and clerks be placed at \$1,000, and "a general system of retiring annuities, based upon length of service, the annuity to be provided by deductions from the salaries of employees invested under the supervision of the Government, the interest on which will be sufficient to provide the annuity to be paid."

A retirement system would give stability to the service, create an inducement to capable men to continue in it, contribute to improved administrative methods, and make possible a standardization of salaries and other needed reforms. The benefits to the service from an equitable retirement system would justify a direct contribution from the public Treasury to create an annuity for superannuated employees in the service at the time the system is established.

— *Department of the Interior. Bureau of Mines. Seventh annual report of the director of the Bureau of Mines to the Secretary of the Interior for the fiscal year ended June 30, 1917. Washington, 1917. 106 pp.*

This report is devoted largely to an account of the progress of investigations being conducted by the Bureau of Mines. One section includes an outline of some of the more important achievements of the bureau during the year. The laws governing the work of the bureau are also given.

— *Department of Labor. Children's Bureau. Child Labor in Warring Countries. A brief review of foreign reports. By Anna Rochester. Industrial series No. 4. Bureau publication No. 27. Washington, 1917. 75 pp.*

This report indicates that the countries whose standards of school attendance and protection from premature and exhausting employment are most nearly comparable with our own have maintained their standards without change during three years of war. The hope is expressed that the report will call attention to the growing concern in the warring countries for the welfare of children and the earnest efforts now being made in the midst of war to improve their condition, and that it will aid in showing not only the importance of maintaining here all the present industrial protection afforded to women and children but of carrying this protection forward notwithstanding war conditions. A more extended summary of this bulletin appeared in the MONTHLY REVIEW for July, 1917, pages 32 to 34.

UNITED STATES.—*Department of Labor. Children's Bureau. From School to Work: A study of children leaving school under 16 years of age to go to work, in Waltham, Mass., an industrial community of about 30,000 inhabitants. By Margaret Hutton Abels. Washington, 1917. 59 pp.*

This report is noted on pages 146 to 151 of this issue of the MONTHLY REVIEW.

OFFICIAL—FOREIGN COUNTRIES.

AUSTRALIA (QUEENSLAND).—*Department of Labor. Report of the director of labor and chief inspector of factories and shops for year ended 30th June, 1917. Brisbane, 1917. 61 pp.*

The following summary, taken from the report, indicates the scope of the activities of the Department of Labor:

Number of registered factories.....	2, 486
Number of shops with employees.....	3, 022
Number of shops without employees.....	3, 069
Number of employees in factories and shops.....	44, 389
Number of factory accidents (Brisbane).....	122
Number of industrial awards in operation.....	125
Number of industrial agreements in operation.....	32
Overtime for year worked by females in Brisbane factories and shops (hours).....	41, 143½
Overtime for year worked by males in Brisbane shops.....	17, 060½
Value of railway and steam passes issued. £4,259 8s. 9d. (\$20,728.55)	
Amount refunded.....	£2,643 1s. 1d. (\$12,862.42)

During the year ending March, 1917, special permits to commence work were issued to 34 children under the age of 14. Arrears of wages secured by the department on behalf of employees during the period covered by the report amounted to £11,196 1s. 3¼d. (\$54,485.64). The State labor exchanges registered 30,191 persons seeking employment and sent 15,780 to employment, the number placed being 52.3 per cent of the supply. Of the persons injured 101 were adults and 21 were under 18 years of age; 116 were males and 6 were females.

CHILE.—*Ministerio del Interior. Legislacion sobre Accidentes del Trabajo. Published under the supervision of the director of the Office of Labor. Santiago de Chile, 1917. lxx, 339 pp.*

This volume gives the text of the law concerning compensation of industrial accidents promulgated December 30, 1916, in the *Diario Oficial*, and the rules and regulations thereunder decreed, June 19, 1917.

It also reproduces the provisions of the civil code relative to civil responsibility in cases of bodily injuries caused by accidents, as well as the provisions of the law of February 15, 1911, concerning compensation for injury or death of employees caused by accident while in the service of the State railroads. (See page 183 of this number of the MONTHLY REVIEW.)

The director of the Office of Labor furnishes information as indicated by the following titles: History of the law (of accidents); definition and classification of industrial injuries; employer; employees, laborers, apprentices, etc.

GREAT BRITAIN.—[*Census Office*] *Census of England and Wales, 1911. General report, with appendices. London, 1917. 383 pp. Price, 4s. 6d. net.*

According to this report the population of England and Wales in 1911 was 36,070,492, an increase of 10.9 per cent over the number at the preceding census in 1901. The report contains an abstract of the 10 volumes comprising the full census returns.

— *Committee on the production and distribution of milk. Interim report. London, 1917. 7 pp. Price, 2d. net.*

This committee was appointed in April, 1916, to report on "the production and distribution of milk, including the consideration of the steps which should be taken (1) to stimulate production, (2) conserve milk supplies during any period of excess, (3) to provide for the special needs of children in urban centers, (4) to effect economies in the cost of production and distribution, (5) to organize supplies by administrative action so as to reach all sections of the community, and (6) other kindred subjects." The committee felt called upon to deal first with the problem of increasing or at least maintaining milk production at its prewar level, giving special attention to the possible shortage and high prices of milk during the present winter. This contingency, it appeared to the committee, could be met by action along the following line: (1) The uncertainty and sense of insecurity which exist among dairy farmers, particularly in respect of prices, labor, and feeding stuffs, should, as far as possible, be immediately reduced; (2) the surplus summer milk should be used to the best national advantage; (3) the loss of milk during the warm months of the year by waste or souring before it reaches the consumer should be reduced. Recommendations along these lines were submitted. The committee also suggested that the use of milk in the manufacture of milk chocolate be prohibited, as was done last year, and also that the surplus milk unavailable for manufacture into dried or condensed milk should be used for making cheese, "as this preserves some 60 to 70 per cent of the nutritive solids of milk (including most of the protein), whereas butter only retains 30 to 40 per cent (excluding the protein)."

— *Departmental committee on prices. Committee appointed by the Board of Trade to investigate the principal causes which have led to the increase of prices of commodities since the beginning of the war. Second and third interim reports. Bread, flour, and wheat prices; freight charges; and potato, tea, and sugar prices. London, 1917. 22 pp. Price, 3d. net.*

This report is noted on pages 112 to 116 of this issue of the MONTHLY REVIEW.

— [Department of Labor]. *Directory of employers' associations and of trade-unions for 1917. London, 1917. 144 pp. Price 2s. net.*

This list of employers' associations, it is explained, is confined to associations which are concerned with matters relating to the employment of labor, the intention being to exclude chambers of commerce, of agriculture and of shipping, trade protection and insurance societies, and all associations with purely commercial or technical objects. The associations are classified by groups of trades, and national associations and federations are distinguished from local associations. Many local associations are, however, affiliated to, or are branches of, national associations.

— *Department of Scientific and Industrial Research. Advisory Council. Report on the resources and production of iron ores and other principal metalliferous ores used in the iron and steel industry of the United Kingdom. London, 1917. 145 pp. Price 2s. net.*

GREAT BRITAIN.—*Department of Scientific and Industrial Research. Science and Industry. A series of papers bearing on industrial research No. 1. Industrial Research in the United States of America. By A. P. M. Fleming, M. I. E. E., London, 1917. 60 pp. Illustrated. Price, 1s. net.*

The following excerpt taken from the introduction outlines the purpose and scope of the report:

The purpose of this memorandum is twofold. It is intended primarily to furnish a record of some observations relating to industrial research as conducted in the United States. To this end descriptions are given of the laboratories in various works, and in educational, State, and private institutions, with a statement of the endowment funds available, and a discussion of legislative and other influences tending toward the nationalization of research, and of the methods of selecting and training scientific investigators, and coordinating their activities and results. The experience so related suggests naturally the consideration of our own country's position in similar matters, and to the account of what is being done in the United States a discussion in very general terms is subjoined, outlining some fundamental considerations which indicate the increasing necessity for research in this country, and offering some suggestions regarding the development of such work, and the relation which any comprehensive national scheme should bear to British industries and to research institutions in the overseas dominions.

— *Imperial War Conference, 1917. Extracts from minutes of proceedings and papers laid before the conference. London, 1917. 163 pp. Price, 1s. 6d.*

— *Local Government Board. Reports to the Local Government Board on Public Health and Medical Subjects. London, 1917. 57 pp. Price, 9d. net.*

This pamphlet includes statistics of the incidence of notifiable infectious diseases in each sanitary district in England and Wales during the year 1916.

— — — *Reports to the Local Government Board on public health and medical subjects. (New series, No. 112). Reports on an inquiry into cases of anthrax (malignant pustule or external anthrax) suspected to be due to the use of infected shaving brushes. By Francis J. H. Coutts, M. D., London, 1917. 22 pp. Price, 6d. net.*

Reference to a number of cases of anthrax caused by the use of infected shaving brushes was made in the MONTHLY REVIEW for July, 1917 (pp. 127, 128). The report here noted gives details of 19 cases (10 fatal) among civilians and of 18 cases (11 fatal) among soldiers at home, besides noting 28 cases among troops in France. Practically all of these cases occurred in 1915 and 1916. It was not definitely proved, however, that all of the cases resulted from the use of infected shaving brushes but the source was traced to a shaving brush in each of at least 11 of the civilian cases and a shaving brush was suspected in each of at least 8 of the military cases. The report suggests the danger of using Chinese, Siberian, or Russian horsehair in the making of shaving brushes, and calls attention to another danger, namely, that of misdescription of consignments resulting in the receipt by retailers of horsehair labeled as goats' hair, the latter not being subject to the Home Office regulations requiring disinfection. It is admitted that disinfection of hair containing anthrax spores is not altogether a simple matter and that there is some reason to think that some of the cases recorded arose from hair which had been submitted to a process of disinfection in which the complete disinfection of the anthrax spores had not been obtained. It is very important that disinfection should be successful and if effected by the steam process it is stated that the cases or bales should be opened, the bundles removed and most of the strings cut, unless the temperature inside the steam apparatus is maintained at 230° F. for half an hour. Furthermore, anthrax spores may remain dormant and yet develop in full virulence when conditions become favorable, emphasizing the importance of complete disinfection.

The report states that the Local Government Board has under consideration what administrative action is required to secure that hair used in the manufacture of shaving brushes is satisfactorily sterilized before the brushes are manufactured. "It will be necessary also to secure that imported brushes are similarly free from infection. For this purpose a guaranty of origin may be desirable as well as examination of samples of brushes after importation."

GREAT BRITAIN.—*Ministry of Labor. Employment Department. Reports upon openings in industry suitable for disabled sailors and soldiers. No. I. Attendants at electricity substations. April, 1917. 6 pp. No. II. Employment in picture theaters. May, 1917. 6 pp. No. III. Tailoring, June, 1917. 7 pp. No. IV. Agricultural motor tractor work in England and Wales. July, 1917. 6 pp. No. V. The furniture trade. September, 1917. 18 pp. No. VI. Leather goods trade. September, 1917. 8 pp. No. VII. Hand-sewed boot and shoe making and boot and shoe repairing. 1917. 12 pp. London, 1917.*

All of these reports were prepared on behalf of the employment department of the Ministry of Labor, the first four being issued in collaboration with the War Pensions, etc., Statutory Committee, and the last three in collaboration with the Ministry of Pensions. Nos. I to IV were noted in detail in the MONTHLY REVIEW for December, 1917, pages 72 to 78. No. V explains the processes involved in furniture making and the disabilities compatible with each process; the length of training required; the wages and prospects in the trade; and includes a syllabus of instruction for the disabled during the course of training. No. VI deals with such leather work as is not subsidiary to other trades. It includes prospects and suitability for the disabled of trunk making and the fancy leather goods trade. The section on training discusses the nature and length of training, courses offered, and wages received during training and after. No. VII discusses the suitability for the disabled man of hand-sewed boot and shoe making and boot and shoe repairing, taking up the processes involved, the prospects and the training necessary, and including a syllabus of instruction for workshops and for schools offering training in this trade.

— — — *Memorandum No. 20. Supplementary to Memorandum No. 5 (Hours of work). Weekly hours of employment. London, October, 1917. [Cd. 8801]. 7 pp. Price 1d., net.*

This memorandum is reprinted in full on pages 82 to 87 of this number of the MONTHLY REVIEW.

— *Ministry of Pensions. The War Pensions Gazette. A monthly journal for war pensions local committees, and for all interested in their work. Nos. 1-7. May-November, 1917. London, 1917. Price, 1d.*

This publication is devoted to the work for disabled soldiers now centralized under the control of the Ministry of Pensions. In the foreword in the first issue, Mr. George H. Barnes announces it as "a journal which will be devoted to their interests and which will aim at the diffusion of accurate information of the best that is being done for them and the promotion of their treatment and training and general welfare."

Regular departments cover certain phases of the work each month. Under "Local committees at work" the operations of the committees located at Leicester, Manchester, county of Haddington city of Birmingham, the borough

of West Ham, the borough of Swansea, and the county of Dumfriesshire have so far been reviewed with special reference to such matters as organization, cooperation, disablements, training, treatment, and employment.

Under "The treatment and training of the disabled" accounts are given of the purposes and methods of hospitals and schools for treatment and re-education, among which are the Cordwainers' Technical College, offering courses in hand-sewed boot making and in the manufacturing of fancy leather goods; the Pilkington Special Hospital at St. Helens, which is physiotherapeutic in character; Queen Mary's Convalescent Auxiliary Hospitals, Roehampton, presenting a variety of technical courses ranging from bookkeeping to poultry farming; and the Military Orthopedic Hospital, at Shepherd's Bush, with its curative manual workshops. Under this heading there appears also an account of the interallied conference held in Paris in May, 1917; and a report on training courses for British prisoners of war in Switzerland.

An important feature of the journal is a department devoted to answers to correspondents. Points of difficulty which appear to be of general interest are dealt with, the rulings and decisions published being official.

Under "Notes of the month" attention is directed to official circulars, regulations, and decisions of general interest to local committees.

A department headed "Pensions in Parliament" deals with "Alternative pensions," "Separation allowances," "Disablement," "Medical treatment," and related subjects.

Besides the regular departments there are special articles on such subjects as "Publicity," "Training and trade-unions," "Pensions in Germany," "The employment of deaf and dumb workmen during the war," "A list of industries considered ordinarily unsuitable for training," "Agriculture," "A ministry of restoration," "National health insurance," "The disabled in Italy," "Report of the committee on institutional treatment," "The children," "Artificial limbs," and "A school of lamp working." "The need for reality," by John Galsworthy, in the July number, calls attention to the necessity of encouraging the disabled soldier to consider his future and avail himself of the opportunity for professional reeducation in order that he may compete with the able-bodied worker rather than take advantage of the present abnormal demand for his labor and accept a situation which he will not be able to keep under normal industrial conditions.

GREAT BRITAIN.—*Parliament. The parliamentary history of conscription in Great Britain: Being a summary of the parliamentary debates, etc., with an index and text of the military service acts and a preface by Richard C. Lambert, M. P. London, Allen and Unwin, 1917. 367 pp.*

The story of the British parliamentary struggle for conscription, down to the passing of the Military Service Acts, 1916.

— *War Pensions, etc., Statutory Committee. Report for the year 1916. London, 1917. 124 pp. Price, 1s. 3d. net.*

This report gives an account of the purpose and work of the statutory committee which was "constituted for certain purposes relating to pensions, grants, and allowances made in respect of the present war to officers and men in the naval and military service of Your Majesty, their wives, widows, children, and other dependents, and the care of officers and men disabled in consequence of the present war and purposes connected therewith * * *" from its first meeting on June 17, 1916, to its dissolution. The functions and work of local committees and subcommittees established by the statutory committee are described, and details and statistics given under such headings as "Finance," "Pensions, grants, and allowances," "Education of children," "Special dis-

ablements subcommittee," "Treatment," "Training," "Employment." An important feature of the report is the account of the establishment of the Ministry of Pensions and of the proceedings of the statutory committee from December 31, 1916, until its dissolution and the transference of its functions and staff to the Ministry of Pensions on August 21, 1917. The latter three-fourths of the report consists of an appendix made up of extracts from circulars of an informational and administrative nature, including schedules and tables relating to the work of the statutory committee and the local committees.

GREAT BRITAIN—(Scotland).—*Local Government Board. Twenty-second annual report, 1916. London, 1917. xlii, 19 pp. Price, 3d. net.*

Gives the number of poor of all classes, including dependents, in receipt of relief on May 15, 1916, as 95,857 or 19.87 per 1,000 of the estimated population at June, 1916; and states that the expenditure for the benefit of those people amounted to £1,324,241 (\$6,444,418.83). The number of poor in 1915 was 103,072 and the expenditure amounted to £1,237,004 (\$6,019,879.97). Under the Old Age Pensions Acts of 1908 and 1911, 1,969 applications were received during 1916. 1,814, together with 112 carried over from the preceding year, being disposed of by December 31. The report notes that considerable work was added to the duties of the board by reason of the decision of the Government to grant an additional allowance of 2s. 6d. (60.8 cents) a week to old-age pensioners suffering special hardship from the high prices of food and from other economic conditions arising from the war. Referring to the work under the Unemployed Workmen Act, 1905, the report says: "Owing to the great scarcity of labor available for general industrial purposes, unemployment in Scotland has virtually disappeared. Two distress committees, however—Glasgow and Aberdeen—found it necessary to afford relief in a limited number of special cases. The Glasgow committee employed an average daily number of 10 persons in general farming work and the manufacture of moss litter, etc. * * * and in Aberdeen an average daily number of 12 persons were occupied in the collecting and sorting of waste paper."

IRELAND.—*Registrar General. Fifty-second annual report, containing a general abstract of the numbers of marriages, births, and deaths registered in Ireland during the year 1915. London, 1916. 73 pp. Price, 1s. net.*

ITALY.—*Cassa Nazionale d'Assicurazione per gli infortuni degli operai sul lavoro. Per la riforma della legge infortuni. Rome, 1915. 391 pp.*

A compilation of proposals for the amendment of the existing workmen's accident insurance law. The first part of the volume gives official proposals, grouped under the following four headings: (1) Proposals by the division chiefs of the main office of the national accident insurance fund (*cassa nazionale*) and by the chiefs of branch offices; (2) proposals of the medical advisory board; (3) proposals of the executive committee; and (4) proposals of the Superior Labor Council. The second part gives a bibliography of Italian and foreign accident insurance legislation, general and special monographs on workmen's accident insurance reform, international congresses on social insurance, and of resolutions relating to accident insurance adopted by congresses and conventions. Statistical data on permanent disability and the capitalized value of pensions are given in an appendix.

The principal reforms proposed are the following: Extension of the classes of workmen subject to insurance; abrogation of the limitation of obligatory insurance to establishments employing at least five workers; more precise indication of the industries subject to insurance; consideration of trade diseases as industrial accidents; designation of the national accident insurance fund as sole authorized carrier of workmen's accident insurance; substitution of pensions

for lump-sum settlements in case of permanent invalidity; increase of indemnities for serious permanent disability; more precise definition of the basic and annual earnings of the insured; obligatory medical arbitration in case of disputes relating to the amount of compensation.

ITALY.—*Cassa Nazionale d'Assicurazione per gl'infortuni degli operai sul lavoro. Rassegna di assicurazioni e previdenza sociale. Bollettino mensile. Vol. 4, No. 4. Rome, April, 1917.*

The April, 1917, number of the monthly bulletin of the National Accident Insurance Fund contains among other matter the text of a circular relating to the liquidation of accident indemnities to workmen employed in military service in the war zone, of another circular on obligatory arbitration of disputes relating to accident insurance of workmen employed in the war zone, and of a third circular relating to the wages of war prisoners employed by public administrations and private parties and the accident insurance of these prisoners. Considerable space is devoted to the reproduction of the discussion by the Senate of a bill for "the protection and aid of war invalids." The full text of a bill for the obligatory insurance of agricultural workmen is also given.

The only statistical data contained in the present issue show the number of workers insured in the national fund against accidents, by sex, for the years 1914, 1915, and 1916. These data are reproduced here in the following table:

NUMBER OF MALE AND FEMALE WORKERS INSURED IN THE ITALIAN NATIONAL ACCIDENT INSURANCE FUND AGAINST ACCIDENT, 1914, 1915, AND 1916.

Year.	Males.		Females.		Total.
	Number.	Per cent.	Number.	Per cent.	
1914.....	682,216	89.36	81,242	10.64	763,458
1915.....	653,939	89.97	72,920	10.03	726,859
1916.....	580,922	86.28	92,347	13.72	673,269
1914-1916.....	1,917,077	88.61	246,509	11.39	2,163,586

The above data indicate a large increase in 1916 in the employment of female labor as compared with 1915.

— *Testo unico della legge per gli infortuni degli operai sul lavoro 31 gennaio 1904, e regolamento per la esecuzione del testo unico predetto. Rome, 1915. 182 pp.*

This volume contains the text of the Italian workmen's accident insurance law of January 31, 1904, and of the regulations for its enforcement and application as well as tables for the computation of compensations payable to survivors of insured persons.

NEW ZEALAND.—*Board of Trade. First annual report. Wellington, 1917. 26 pp.*

In accordance with the Cost of Living Act of 1915, the Board of Trade presented this, its first annual report, to the governor general to be laid before the General Assembly. The report covers a period from the inception of the board, March 1, 1916, to March 31, 1917, and gives the results of its investigation of high prices and related questions. A summary of the report on flour, butter, and meat will be found on pages — to — of this issue of the MONTHLY REVIEW.

— *Department of Labor. Twenty-sixth annual report, 1917. Wellington, 1917. 21 pp.*

During the year 1916-17, 2,966 persons were assisted through the men's employment bureaus, a decrease of 3,012 (50.4 per cent) from the preceding year.

In 12,455 factories the number of workers was 78,188, a decrease of 4,823, or 5.8 per cent, from the preceding year, which is "evidence of the effect of the withdrawal from civil employment of a large number of men for defense purposes." The report states that the overtime worked by females and boys (no record having been made of overtime worked by males over 16 years of age) in 15 principal towns amounted to 489,374 hours as compared with 432,250 hours during the year 1915-16. The boot and shoe trade was responsible for 32,178 hours (about 6.6 per cent) of overtime. The overtime in munition works amounted to less than one-half of that worked during the preceding year—16,569 as against 41,534 hours. A total of 1,171 accidents (5 fatal) is recorded, an increase of about 10 per cent over the preceding year. During the year 37 cases were dealt with under the workmen's compensation act, as compared with 52 during 1915-16. The commissioners and councils of conciliation were instrumental in settling, or substantially settling, 159 out of 190 disputes. Appended to the report is a statement by the deputy superintendent of workers' dwellings relating to the operations of the act during the year ending March 31, 1917.

RUSSIA.—*Senatc. Sobranie Uzakoneni i Rasporiazhenii Pravitelstva, Izdavaemoe pri Pravitelstvuyushchem Senatc. September 1, 1917. No. 269. Part 1.*

This is a collection of governmental decrees and orders promulgated by the Russian Senate, June 30 to August 5, 1917. Decree or order No. 1327 provides for the settlement of industrial disputes by recourse to conciliation. Failing to reach a settlement through this, a board of arbitration is appointed. The board is to consist of an equal number of delegates selected from employers and employees.

SPAIN.—*Instituto de Reformas Sociales. Sección Primera. Legislación del Trabajo. Apéndice undécimo, 1915. Madrid, 1916. 374 pp.*

This volume, in connection with the 10 previously issued under the same title, forms a complete code of labor laws in force in 1915. Proposed laws and amendments presented to the National Congress during the year 1915 are reproduced.

The laws are presented in part 1 under the following titles: I. Industrial accidents; II. Agricultural; III. Associations; IV. Labor contracts; V. Cooperation; VI. Industrial education; VII. Laborers' dwellings; VIII. Strikes; IX. Labor inspection service; X. Women and children; XI. Deposit and loan funds; XII. Saving funds; XIII. Agricultural associations; XIV. Other laws. In part 2 are given proposed amendments relative to: I. Associations; II. Labor contracts; III. Hours of labor; IV. Women and children (protection of infants); V. Saving funds; VI. Other amendments.

— — — *Legislacion sobre asociación. Madrid, 1916. 223 pp.*

A compilation of the more important provisions of the laws and orders and interpretations of legislation relative to associations of a social character in Spain, and more especially those of interest to laborers, cooperative societies, and agricultural credit associations.

The subject matter is classed as follows: A. Laws and regulations; B. Explanations and interpretations of laws and regulations.

Under each of these general heads the laws are divided into the following five classes: I. Associations in general—laborers' associations; II. The right of associations to representation in central bodies; III. Mutual aid and cooperative societies; IV. Credit societies; V. Other associations.

Laws enacted since February 1, 1916, are inserted as an appendix.

SPAIN.—*Instituto de Reformas Sociales. Sección Primera. Legislación sobre Accidentes del Trabajo. Madrid, 1916. 215 pp.*

A compilation of laws relative to industrial accidents. The volume is divided into two parts: A. Laws and regulations; B. Explanations and interpretations. In part 1, which presents the laws, copious references are made to explanations and interpretations appearing in part 2.

— — — *Legislación sobre Descanso Dominical. Madrid, 1917. 276 pp.*

This volume is a compilation of the laws relative to Sunday rest. It is divided into two principal heads: A. Laws and regulations; B. Explanations and interpretations. In part 1, reproducing the laws, copious references are made to royal orders interpreting the laws.

— — — *Sección 3d. Técnico-Administrativa. Coste de la Vida del Obrero. Estadística de los precios de los artículos de primera necesidad en toda España, desde 1909 a 1915. Madrid, 1916. 348 pp.*

This is a compilation of prices of principal articles of consumption in workmen's families from 1909 to 1915. The data used in this compilation were in general furnished semiannually by the mayors (alcaldes) of the various municipalities. Prices are reported separately for capital cities and other cities, towns, etc. The number of schedules received for each period covered, after the first, was from 6,000 to 7,000. Index figures have been computed for each province.

UNOFFICIAL.

ACKERMAN, FREDERICK L. *Our National Obligation: The story of England's colossal work in building workmen's houses as a prerequisite to maximum output of war munitions, and as a part of her program of social and economic reconstruction after the war. Washington, D. C., Journal of the American Institute of Architects, [1917] 52 pp. (Reprint from the December, 1917, issue of the Journal of the American Institute of Architects, Washington, D. C., and forming chapter IV of the serial article "What is a House?" which began in the October issue of the Journal.)*

Summarized in this issue of the MONTHLY REVIEW, pages 209 to 213.

ALDRIDGE, HENRY R. *The case for town planning: A practical manual for the use of councillors, officers, and others engaged in the preparation of town planning schemes. London, National Housing and Town Planning Council, 1916. 679 pp. Illustrated.*

An important work by the secretary of the National Housing and Town Planning Council, of Great Britain. In Part I the subject is dealt with from the historical point of view; "so far from town planning being a 'modern fad,' it is one of the oldest of the arts evolved in the slow development of organized civic life in civilized countries." It is further dealt with from the point of view of the officers responsible for the good government of a town, who can be persuaded to undertake such schemes only if it can be proved to their satisfaction that "public health will be improved, the amenities of life increased, and wise economy observed both in saving the money of the ratepayers and in expending it." Part II was written in response to a demand that the powers and duties of the Housing, Town Planning, etc., act of 1909, should be explained in a clear, simple, and concise way, and that the work of actual town planning administration, in its various stages, should be described in detail.

"From one point of view indeed the period in which this book is published is a specially favorable one. The sense of common citizenship was never greater than it is to-day, and proposals in regard to the improvement of the conditions under which the masses of the people live will receive warm support."

ALLEN, LESLIE H. *Industrial Housing Problems*. Boston, Mass., Aberthaw Construction Company, [1917] 31 pp. Illustrated.

Summarized in this number of the MONTHLY REVIEW, pages 208 and 209.

AMERICAN ASSOCIATION FOR LABOR LEGISLATION. *Review of labor legislation of 1917*. *The American Labor Legislation Review*, Vol. VII, No. 3, New York, September, 1917. pp. 529-618.

AMERICAN MINING CONGRESS. *Utah Chapter. Report on Insurance rates for mining and smelting under the workmen's compensation law of Utah*, by I. M. Rubinow, Ph. D., to Utah Chapter, American Mining Congress. June 6, 1917. [Salt Lake City] 23 pp.

A digest of this report will appear in a future issue of the MONTHLY REVIEW.

BAUER, STEPHAN. *Untersuchungen über die Lebenskosten in der Schweiz. Mit Beiträgen von E. Ackermann, P. Gross, W. Kaufmann, Jacob Lorenz und A. Menzi. (Schriften des Vereins für Sozialpolitik. Vol. 146, Part 1.) Munich and Leipzig, 1917. xxiii, 303 pp.*

At the end of 1913 Dr. Stephan Bauer, professor in the University of Basel and editor of the present volume, was charged by the German Social-Economic Society (Verein für Sozialpolitik), which at that time was conducting an international investigation on the cost of living and the movement of prices, with the duty of making an investigation of the same scope with respect to Switzerland. With the aid of pupils and collaborating friends Dr. Bauer expected to be able to publish the results of the Swiss investigation by the end of 1914. The outbreak of the war in 1914 and the consequent calling into military service or withdrawal from scientific work of several collaborators in the investigation deferred the realization of this expectation. A new problem, the enormous increase of prices during the war, had also arisen. When, therefore, the compilation of the results of the investigation was again taken up in 1917 it was considered very desirable that the two first years of the war be included in the investigation.

Dr. Bauer states that, for various reasons, an investigation including all cantons of Switzerland and conducted on uniform principles was out of the question, but that the collection of monographs contained in the present volume forms a good substitute for such an investigation. First, because the volume contains the results of a mass investigation of prices through cooperative stores in all parts of Switzerland. Secondly, because two monographs on household budgets, each of which covers a period of over 30 years, permit an insight into the movement of household expenditures. Compilations of the results of local investigations conducted in the city of Basel and in the canton Aargau are also given to produce a more complete picture of the trend of the cost of living in Switzerland. In a preface to the above monographs the author summarizes the data contained in them, and compares the cost of living data for Switzerland with similar data obtained in investigations relating to other countries.

BENOIST, CHARLES. *L'Organisation du travail. Tome premier, Paris, 1905. 493 pp. Tome deuxième, Paris, 1914. 374 pp.*

These two volumes give a history of the development of labor during the last century and one-half in the light of political and economic conditions which the author claims have brought about what he calls "the crisis of the modern State;" and discuss industrial problems of the present. The first volume is divided into two parts: "Work, the mass, and the State," in which the mechanical and social conditions that have influenced labor are traced from the utilization

of steam in mechanics to the present; and "Investigations concerning labor in large industries," under which oil mines, metallurgy, mechanical construction, glass works, and textile industries are considered. The second volume, under the heading "The species? The workingman, the working class," discusses "Formation of the working class—the corporation and the old order," "The hierarchy of vocations in the old French society," "The rehabilitation of the mechanical arts," "The apology of labor as the apotheosis of the workman," "The man of 1848," and "The myth of the working class."

BITTARD, A. L. *Les écoles de blessés. Paris, 1916. 251 pp.*

An account of the work which had been done in the line of pensions, prosthesis, apprenticeship, and placement, up to the time of publication, for disabled soldiers of France, with the view of returning them to civil life. There are chapters on wounds and the wounded, recompense and pensions, functional re-education and prosthesis, vocational reeducation, trades for the wounded, twenty months of scattered efforts, the creations of private initiative, the creations of municipalities and departments, the creations of the State, the school of the wounded, accidents and assurances, placement, general organization of vocational reeducation, the blind and the deaf, and the return to life. A valuable feature of the book is an appendix containing a list of the public services and the principal works and schools concerned with the vocational re-education and placement of the wounded; a classified list of the principal vocations taught in the schools for the wounded; an outline of the conditions for admission to the centers for reeducation approved by the State; and the parliamentary documents concerning the work for disabled soldiers.

BUBNOFF, J. V. *The cooperative movement in Russia: Its history, significance, and character. Manchester (Eng.) Cooperative Printing Society, Ltd., 1917. 162 pp. Illustrated.*

"The first attempt in the English tongue to give a connected systematic survey of the cooperative movement in Russia," which movement—in spite of the absence of enactments legalizing and regulating it, in spite of "administrative interference and oppression"—has become a power to be reckoned with. The study covers agricultural Russia; the various forms of organization of the cooperative movement; institutions for its promotion and assistance; unions, associations, and banks; effects of the war; international tendencies; and other aspects.

CALHOUN, ARTHUR W. *A social history of the American family from colonial times to the present. Vol. I: Colonial period. Cleveland, Arthur H. Clark Co., 1917. 348 pp. Bibliography.*

The first of three volumes designed to develop an understanding of the forces that have been operative in the evolution of family institutions in this country. "In general, the colonial family is presented as a property institution dominated by middle-class standards, and operating as an agency of social control in the midst of social order governed by the interests of a forceful aristocracy which shaped religion, education, politics, and all else to its own profit."

CALIFORNIA STATE FEDERATION OF LABOR. *Preamble, constitution, and rules of order, as amended at 18th annual convention, held at Sacramento, Cal., October 1-6, 1917. San Francisco, 1917. 24 pp.*

— *Proceedings of 18th annual convention, Sacramento, October, 1917. 118 pp.*

Includes a report on the labor legislation of the year, and a compilation of the dates of harvesting crops in the various sections of the State which indicates the possibility of organizing seasonal laborers and having them "follow up" the harvesting. The number of organizations in good standing in the Federation is given as 519, with a total membership of 71,500 persons.

CARREL, A. AND DAKIN, G. *The treatment of infected wounds.* New York, Paul B. Hoeber, 1917. 238 pp. Illustrated.

The researches dealt with in this book were made in France by Dr. Henry D. Dakin and Dr. A. Carrel. They were begun late in December, 1914, and "from May, 1915, it became evident that wounds treated after a certain method by the aid of hypochlorite or the chloramines of Dakin were sterilized, without any harm resulting to the tissues or the patient. From that date it has been possible to prevent, in the greater number of cases, infection of wounds, and to abolish, almost entirely, suppuration in hospitals." The importance of this may be gathered from the fact that the examination of a large number of amputations in a French hospital showed that about 70 per cent of the operations were necessary because of infection and were not due to the extent of the original injury.

In this volume "Carrel's method" is described in minute detail. In their introduction the authors make this statement: "The application of these principles constitutes a 'method,' that is to say, an entity, no portion of which should be altered at random. The deplorable results obtained in several hospitals by surgeons who believed they were using our methods, but who, in reality, were altering them according to their fancy, make clear the necessity for observing exactly the directions which will be laid down in the following pages. The best way to learn the method is to see it applied. Hence this book is especially intended to recall essential details of the technique to those who already know something of its application."

The extreme importance of this strict adherence to the technique is emphasized by Sir Anthony A. Bowlby, surgeon general, British Army Medical Service, who contributes an introductory note, and again by the authors at the close of the book, as follows:

Neither the preparation of Dakin's solution may be modified, nor the processes for mechanical and chemical cleansing of wounds. It is indispensable to learn the method before attempting to apply it, and this apprenticeship demands several weeks, even from an experienced surgeon. But we can be quite sure that, applied in their entirety, the methods just described will produce the desired results. Admitted, their use exacts more precision and more care than the old methods, for any approach toward technical perfection requires more elaborate apparatus and a more specialized staff. But efforts of no great magnitude on the part of doctors and nurses will most certainly yield an immense improvement in results. The Nation has the right to ask from the medical corps that progress in the treatment of the wounded which is so acutely needed.

For formulas of Dakin's solution and discussions of its use, see MONTHLY REVIEW for November, 1917, pp. 173 to 178.

CHAMBER OF COMMERCE (PHILADELPHIA). *The Educational Committee. Eleven pamphlets. Thrift: A short text book for elementary schools of Philadelphia, 15 pp. Trust companies in Philadelphia, 7 pp. The rug and carpet industry of Philadelphia, 16 pp. The locomotive industry in Philadelphia, 11 pp. Truck farming in Philadelphia County, 12 pp. The candy-making industry in Philadelphia, 15 pp. Milk and its distribution in Philadelphia, 12 pp. Telephone, telegraph, and wireless systems in Philadelphia, 17 pp. The manufacture, distribution, and use of gas in Philadelphia, 61 pp. Department stores of Philadelphia, 11 pp. The paint and varnish making industry in Philadelphia, 29 pp. Philadelphia, Pa. [1917].*

EMPLOYERS' FEDERATION OF NEW SOUTH WALES. *Report of annual meeting, 15th November, 1917. Sydney, Offices of the Federation, 1917. 32 pp.*

Report of the fifteenth annual meeting of this federation. Includes the resolutions passed at the eighth annual conference of the various employers' federations of the Commonwealth, a table of anti-strike legislation throughout

Australasia, and a comparison of the number of strikes in New South Wales before the war and since. During the year 1913 there were 134 strikes, involving 40,011 persons, and during the year ending in September, 1917, a total of 330 strikes, involving 157,756 persons. The address of the president of the New South Wales federation, covering more than eight pages, affords a survey of industrial conditions from the standpoint of the employer.

EPSTEIN, ABRAHAM. *The Negro Migrant in Pittsburgh. A study in social economics. Published under the supervision of the school of economics, University of Pittsburgh. Pittsburgh, 1918. 75 pp. Illustrated. Price, 50 cents.*

See pages 155 to 157 of this issue of the MONTHLY REVIEW for an extended summary of this report.

HOBSON, S. G. *Guild principles in war and peace. London, G. Bell & Sons, 1917. 176 pp.*

These essays, reprinted from various sources, present the arguments and considerations that have impelled the author to advocate the abolition of the wage system and the formation of national guilds. "A national guild is the combination of all the labor of every kind, administrative, executive, and productive, in any particular industry. It includes those who work with their brains and those who contribute labor power." The fundamental idea of the guilds is "that they shall exercise full control over labor and enjoy complete autonomy in all industrial transactions."

The book is largely devoted to a critique of the Garton Memorandum, described by Mr. Hobson as "the most representative document issued on the industrial situation." The editor of *The New Age*, with which publication the author is associated, contributes a 14-page introduction on the subject of unemployment, Mr. Hobson making the assertion that "after the war we can not escape from a dreadful and probably a prolonged period of acute unemployment."

HOXIE, ROBERT FRANKLIN. *Trade-unionism in the United States. New York and London, Appleton, 1917. 426 pp.*

"The book here presented is the result of an effort to reproduce as faithfully as possible the notes and lectures on trade-unionism used by Robert F. Hoxie during his last year of teaching in the University of Chicago, and to combine them with some of his chapters previously published." Great care has been put into the preparation of the volume by friends who knew that Prof. Hoxie had looked forward to the writing of a book on trade-unionism as the main work of coming years.

In his very able introduction, Mr. E. H. Downey makes the statement that, like all social movements which excite the hopes and fears of men, trade-unionism has more often been the object of passionate denunciation or defense than of scientific inquiry; few persons have brought forth from patient research even a partial interpretation of it in causal terms, and among this elect number Prof. Hoxie will hold "a high and secure place."

MAWSON, THOMAS H. *An imperial obligation: Industrial villages for partially disabled soldiers and sailors. London, Grant Richards, 1917. 124 pp. Illustrated.*

A scheme for the establishment of industrial villages for disabled soldiers and sailors and their families, the occupations to be confined to one industry to a village but divided among home, shop, and factory workers. It is suggested that the production be encouraged of articles heretofore imported from enemy countries, such as pencils, office furnishings, toys, chemical preparations,

and bulbs and decorative nursery stock. Around a center already supporting a dominating industry might be established villages to follow the trades and crafts subsidiary thereto.

The method of control proposed is that of committees—central, district, and village; for organization purposes there has been formed "The Industrial Villages Interim Committee," with offices in London. It is recognized that the work must be begun on a subsidized or semiphilanthropic basis, but the villages are expected to become entirely self-supporting.

The appendixes to the book include a synopsis of its contents, a description of Lever Bros.' copartnership scheme, and several articles on the reeducation of the disabled by various existing agencies.

MILLS, FREDERICK C. *Contemporary theories of unemployment and of unemployment relief*. New York, Longmans, Green & Co., and London, P. S. King, 1917. 178 pp. *Bibliography. Columbia University Studies in History, Economics, and Public Law, No. 183.*

"So far as has been possible the work has been held strictly to a study of theories as to the causes of the modern phenomena of unemployment and as to the methods by which unemployment can be prevented or relieved. Facts concerning the extent of unemployment have been touched upon only where they have a bearing upon either of these two subjects."

The author groups his material according to the development in England and in the United States of unemployment theory and remedial practice, and contemporary theories of unemployment and of its relief in the same countries. A brief compendium of the course of tramp and vagrancy legislation in the United States is included.

M. S. *Domestic service: by an old servant*. Boston and New York, Houghton Mifflin, 1917. 111 pp.

"Written by an old servant who must speak of domestic service as it has been to her 52 years of her life."

MURRAY, MARR. *Drink and the war, from the patriotic point of view*. London, Chapman and Hall, 1915. 156 pp. Price 1s.

Written to the text "The nation that will win the next war will be the one which is the most sober"—a statement by the Kaiser.

NATIONAL HOUSING ASSOCIATION. *Housing problems in America. Proceedings of the sixth national conference, Chicago, October, 1917*. 462 pp.

A brief report of the proceedings of this conference appeared in the MONTHLY REVIEW for December, 1917, pp. 215 to 218. The present volume gives the papers and discussion in full, and includes several valuable contributions on the subject of industrial and war-time housing, of such immediate importance in various sections of the country.

NATIONAL INDUSTRIAL CONFERENCE BOARD. *Analysis of British wartime reports on hours of work as related to output and fatigue. Number 2, November, 1917*. 15 Beacon Street, Boston, 1917. 57 pp.

As announced in the foreword, the National Industrial Conference Board has deemed it advisable, because of the timeliness and importance of the experience of Great Britain with the hours of labor problem, to publish this analysis of reports of certain British commissions and investigators on the efficiency and health of industrial workers under wartime conditions. This analysis is intended to be somewhat critical, but an effort has been made to avoid all expressions of opinion which might anticipate or prejudice the results of the board's broader inquiry into the relation of hours of labor to industrial efficiency, with special reference to the health and safety as well as to

the output of workers. The reports of the British Health of Munition Workers, to which reference is made in this pamphlet, have been noted from time to time in the MONTHLY REVIEW.

NEW YORK ASSOCIATION FOR IMPROVING THE CONDITION OF THE POOR. *Bureau of Home Economics. Food for the family. Publication No. 120. New York, 1917. 15 pp. Price, 5 cents.*

A leaflet suggesting the meals best suited to growing children and giving recipes for the unfamiliar dishes.

PHELPS, EDITH M., ED. *University debaters' annual: Constructive and rebuttal speeches delivered in debates of American colleges and universities during the college year 1916-17. New York, H. W. Wilson Co., 1917. 272 pp.*

This volume, the third of its series, contains speeches on Government ownership of railroads, universal military service, compulsory arbitration of railroad labor disputes, Chinese and Japanese immigration, compulsory arbitration [in general], and progressive inheritance tax.

ROTHBAND, HENRY L. *Employment for disabled soldiers. A scheme for a national roll of employees. [Manchester, Eng., 1916.] 72 pp.*

——— *The Rothband employment scheme for sailors and soldiers disabled in the war. [Manchester, Eng., 1917.] 51 pp.*

Mr. Rothband, a Manchester manufacturer, proposes a Royal appeal by the King or the Prince of Wales, to all employers of labor, inviting them to promise permanent employment for one or more disabled soldiers. The earlier report summarizes the argument for Mr. Rothband's plan and narrates its history from its inception, in March, 1915, through the year 1916. Opinions of various prominent public men are included. The 1917 report, which is a continuation of the earlier one, describes the proposed development of the scheme, and its reception by local pensions committees, and discusses in detail the official objections to it.

SOUTHALL, A. E., ED. *Imperial Yearbook for Dominion of Canada, 1917-18. Third year. Ottawa, Mortimer Co., 1917. 637 pp.*

In addition to the usual great amount of statistical and other information, this volume includes a "war section" of 63 pages, with separate index.

VICTOR, E. A., ED. *Canada's future: What she offers after the war. A symposium of official opinion. Toronto, Macmillan, 1916. 320 pp.*

About 50 short articles on the advantages offered by Canada to the immigrant. A commendable feature is the footnotes which introduce the writers.

WEEKLY UNDERWRITER. *Live articles on accident prevention, No. 5. New York, Underwriter Printing and Publishing Co., 1917. 143 pp. Illustrated. Price \$1.05.*

A series of articles reprinted from the monthly liability insurance supplement of The Weekly Underwriter, 1916-17. Includes The shipbuilding industry, by Robert H. Pearson, consulting engineer, and Safety in explosives manufacturing, being the rules established by the departments of labor of Pennsylvania and New Jersey, effective April 1, 1917.

WOOD, T. B. *The national food supply in peace and war. Cambridge (England), University Press, 1917. 43 pp. Price 6d. net.*

The author of this pamphlet was a member of the food (War) committee of the royal society, which made an investigation, at the request of the Board of Trade, of the food supply of Great Britain before the war. The present study is in two parts, dealing with the food supply before the war and in time of war, and has been prepared that the general public may form a fair estimate of the "admittedly difficult situation." Part II includes an estimate of the requirements and of the foods available for 1917-18, deals with sources of supply, distribution, diversion, etc., and suggests a policy of control based on the fact

"that the prices of agricultural commodities are mutually related and that their relationships are susceptible of investigation," which investigation should be the basis of price fixing. There are several important tables giving origin, distribution, consumption, food values, requirements, and other figures.

WORKMEN'S COMPENSATION PUBLICITY BUREAU. *Digest of workmen's compensation laws in the United States and Territories, with annotations. Fifth edition, revised to December 1, 1917. F. Robertson Jones, compiler, 80 Maiden Lane, New York, 1917.*

This digest covers all the compensation laws enacted to date, including the new and amended acts passed in 1917. It contains a tabular synopsis of the principal provisions of the laws arranged in the same form as the preceding editions except that the citations of cases, formerly included in the table, are now grouped separately in a second table. Two new captions, "occupational and other diseases" and "evidence and proof," have been added; while one provision, "employments in interstate commerce," has been omitted in view of the decision of the United States Supreme Court in the Winfield cases, which declared that States had no jurisdiction over accidents sustained in interstate commerce.

MONTHLY REVIEW

OF THE

U. S. BUREAU OF LABOR STATISTICS

VOL. VI—NO. 3

WASHINGTON

MARCH, 1918

COST OF LIVING IN THE DISTRICT OF COLUMBIA.

SIXTH ARTICLE—WAGE-EARNING WOMEN: FOOD, HOUSING, AND SUNDRIES.

The preceding article of this series discussed the clothing expenditures of wage-earning women in the city of Washington as developed in the present investigation. It also sought to bring out, in a very general way, the expenditure necessary, for a working woman in that city, to maintain a condition of dress that would meet the tests of physical comfort, social decency, and agreeable outward appearance.

An analysis, along quite similar lines, may be made as regards the expenditures for food and lodging. In the following brief presentation of the results of the present study on this subject, it must be borne in mind that the investigation was made in the spring of 1917. In the months since then, as a result of the great influx of people into the District of Columbia combined with the general rise in prices, there have been very general and very marked advances in the cost of rooms and meals. To just what extent this has affected the housing conditions of the women included in this study is not known. But, in a general way, it is known that, for many of them at least, wages did not increase as rapidly as rents and prices, and, as a result, for practically all wage-earning women in Washington the problem of food and lodging is now an even more serious one than it was 8 or 10 months ago.

VARIOUS METHODS OF LIVING.

Of the 600 white wage-earning women covered by the present study, 414 were living at home with their immediate families, all but 51 of these living with parents. The remaining 186 lived away from home, either in private families, in commercial boarding houses, in working girls' homes, or were housekeeping on their own account.

In certain employments the number of women living away from home was proportionately much greater than in others. Thus, of the 12 waitresses scheduled only 2 were living at home, whereas 29 of the 38 telephone girls were so living. Among store employees about one-third were living away from home. The distribution, on this

point, of the 600 women scheduled, is shown in the following table, which also classifies these women by marital condition:

TABLE 1.—LIVING CONDITIONS AND OCCUPATION.

	Total.	At home.	Away from home.

Total.....	600	414	186	84	58	25	19

As regards the 414 women living at home little can be said as to the character or cost of their food and lodging. Often such women were assisted by their families and paid only a nominal board. On the other hand, such women were often supporting their families in whole or in part and turning in all their surplus money to the general family fund. In practically all cases of women living at home, therefore, the amount paid to the family was not determined by commercial reasons and was not a measure of the accommodation received in return.

In the case of women living away from home, board and lodging are usually placed upon a strictly business basis, but not always even then. The strict commercial relationship is most clearly marked in the case of the usual boarding house, where the payments by the boarders must cover all expenses of maintenance. The financial basis is also clearly marked in the case of a woman who is doing house-keeping on her own account, renting a room or rooms and preparing her own meals. In case of board in a private family the personal factor sometimes enters. The family may charge less than the market price because of friendship or relationship or simply for the sake of companionship. In the case of working girls' homes the rates charged are usually below what they would be if the homes were conducted on a commercial basis, and very often the rates are fixed not upon cost but upon the earnings of the girls.

The woman living away from home has the choice of four alternative ways of living. These, as noted, are: With private families, in commercial boarding houses, housekeeping in one or more rooms, and living in homes established for working girls. Certain combinations

of these methods are possible but in practice were found not to be frequent.

Each of these ways of living has its merits and demerits. The cheapest accommodation is found in those working girls' homes in which the rates are in proportion to the earnings of the girls. But, aside from the objections that many women have to such homes, the total accommodation of all such establishments in Washington is too small to have much influence upon the situation.

Housekeeping—i. e., renting a room or rooms and getting one's own meals therein—was preferred by many women because such a method of living may be made most to approximate a true home. Married women appeared particularly favorable to this form of living. Of the 43 married women not living at home 27, or nearly two-thirds, were housekeeping. This is probably explained by the fact that married women in most instances have had a taste of maintaining a home of their own and where possible prefer to keep on with it. A good many of them, also, have some equipment left from former housekeeping experiences as well as some practical experience to guide them on the way. Housekeeping, too, is undertaken by many women for reasons of economy. By cooking on a gas stove, or even a gas jet in one's room, and buying cheaply, the cost of food may be reduced to a minimum. The evil here is, of course, that not only is the food usually badly chosen but this form of living is conducive to an economy that may easily border on starvation.

THE COST OF LODGING AND FOOD.

Because of these varying methods of living and the absence of agreed-upon standards of adequacy in housing no precise conclusions can be drawn as to the cost of satisfactory food and lodging in the city of Washington; but by studying separately the actual living conditions of each of the four groups mentioned a fair idea may be obtained of the cost of food and shelter for a working woman in Washington. In doing so, a rough standard of adequacy is necessarily adopted. It is: A furnished room, occupied alone and adequately heated, sufficient palatable food to provide nourishment necessary for the work performed, and the use of sitting room to receive company.

A careful study of the experiences of the various women included in this study leads to the conclusion that \$6 per week was the bare minimum upon which the average woman could obtain adequate board and lodging in Washington in the early part of 1917, and that a somewhat larger amount was necessary to insure any considerable degree of comfort. This was arrived at by an analysis of the actual amounts spent and the accommodations received by groups of women living in the four ways above mentioned—(1) private families, (2) boarding houses, (3) housekeeping, and (4) working girls' homes.

(1) **Private families.**

In considering the cost and character of the living accommodations of women living in private families, it seems best to limit attention to those who were boarding in families with which there was no close relationship, as such relationship often complicated the question of the commercial value of the living secured. Of the women covered by this study, 52 were without this limitation. In Table 2 are listed for each of these 52 women separately, her age, occupation, and income; also the amount paid for room and board, and a brief description of the character of the accommodation received for the money paid. The weekly rate shown was the rate paid at the end of the scheduled year and in some cases exceeded the weekly income. This meant that the individual in question was living, at that particular time, beyond her income.

Examination of this table shows clearly that the five cases where less than \$4 per week was paid were abnormal. One woman worked three or four hours a day to help in paying for her board; another had all meals provided at her place of employment; a third shared a room with two other girls; a fourth had one meal furnished at place of employment besides sharing her room with the landlady; and a fifth both shared her room and helped with housework.

For the 18 women paying \$4 and under \$5 weekly, the living accommodations of only 3 were apparently devoid of defects. In the other cases the women either gave considerable help with the work, shared their rooms with others, had inadequate heat, or else had some meals furnished outside; in many cases a combination of these was operative.

Of the 14 women paying \$5 and under \$6, only 2 were apparently getting a fair standard of living.

Eleven women were paying \$6 and under \$8, and of these 6 had comfortable rooms and adequate board.

Thus it would seem safe to conclude that, although in exceptional cases room and board were obtained at a weekly cost of under \$6, not until the \$6 mark was passed could a woman under ordinary circumstances obtain fairly adequate living conditions in a private family.

TABLE 2.—COST OF ROOM AND BOARD IN PRIVATE FAMILIES.

Age.	Occupation.	Annual income.	Weekly rate for food and lodging.	Character of accommodation.
31	Saleswoman.....	\$212.25	\$1.25	In addition worked 3 or 4 hours a day.
22	Waitress.....	390.00	1.40	Received all meals at place of employment. Very small room.
18	Tailor work.....	274.00	3.00	Shared room with 2 other girls.
26	Cashier (office).....	454.00	3.50	Received 1 meal at place of employment. Shared room with landlady.
22	Telephone.....	525.27	3.63	Shared room with cousin. Helped 30 minutes a day with housework.

TABLE 2.—COST OF ROOM AND BOARD IN PRIVATE FAMILIES—Concluded.

Age.	Occupation.	Annual income.	Weekly rate for food and lodging.	Character of accommodation.
20	Factory.....	\$224.00	\$4.00	Third-floor room. No sitting room in house. Bought many meals outside.
20	Office.....	329.00	4.00	Room insufficiently heated. Helped 30 minutes a day with housework.
20	Telephone.....	504.84	4.00	25-minute ride to work. Otherwise apparently satisfactory.
22	Factory.....	403.50	4.14	Very small room and very cold; shared with another woman.
27	Saleswoman.....	446.55	4.20	Lived with aunt. Helped 8 or 9 hours a week with housework.
29	do.....	775.50	4.30	Lived with friends. Shared room; 30-minute ride to work.
33	Waitress.....	712.37	4.38	Received 2 meals a day at place of employment. Shared room.
30	Saleswoman.....	297.00	4.50	Shared small room with daughter of landlady.
24	Office.....	550.00	4.50	Apparently satisfactory.
23	do.....	585.00	4.50	Shared room with daughter in family. Helped with dishes at night.
25	Saleswoman.....	545.50	4.60	Lived with aunt. Shared room. Helped some with housework.
22	Telephone.....	437.00	4.62	Insufficient heat. Lived with friends and helped 8 hours a week with housework.
24	United States (Bureau of Engraving and Printing).	542.65	4.62	Shared room. Helped 1 hour a day with housework; 35-minute ride to work.
29	do.....	547.20	4.62	Shared room. Helped 30 minutes a day with housework; 30-minute ride to work.
50	Factory.....	428.25	4.63	Shared room with landlady. Furnished own bed and rug; 45-minute ride to work.
33	do.....	447.00	4.71	Lived with cousin. Shared room; 30-minute ride to work.
27	United States (clerk).....	787.16	4.80	1-hour ride to work. Otherwise satisfactory.
33	Office.....	523.50	4.90	Lived with cousin. Helped 30 minutes a day with housework.
28	Factory.....	388.50	5.00	Shared room with 2 others. Helped some with housework. Did 2 weeks' dressmaking for family.
35	Saleswoman.....	500.00	5.00	Small, unheated room. Helped 6 hours a week with dishes. Took care of own room.
19	Office.....	491.00	5.02	Shared room; 25-minute ride to work.
32	United States (Library).....	815.50	5.19	Apparently satisfactory.
36	Saleswoman.....	470.43	5.20	Lived with aunt. Helped 15 hours a week with housework; 45-minute ride to work.
20	United States (stenographer)	866.50	5.38	Lived with aunt. Helped some with work; 25-minute ride to work.
31	Saleswoman.....	492.37	5.40	Helped 30 minutes a day with housework.
42	do.....	614.00	5.45	Lived with friends. Apparently satisfactory.
17	Office.....	566.00	5.49	Shared room with another girl.
23	Laundry.....	336.25	5.50	Lived with mother-in-law. Shared room.
28	United States (Bureau of Engraving and Printing).	505.80	5.59	Lived with aunt. Shared room. Helped 30 minutes a day with housework; 30-minute ride to work.
28	Saleswoman.....	500.00	5.65	Shared room 12 weeks with dependent son.
27	United States (Bureau of Engraving and Printing).	540.15	5.73	Shared room. Insufficient heat.
29	do.....	541.60	5.84	Room insufficiently heated.
36	Saleswoman.....	420.00	6.00	Apparently satisfactory.
48	do.....	433.00	6.00	Insufficient heat.
39	do.....	781.50	6.00	One roommate.
20	Telephone.....	556.29	6.20	Lived with aunt. Shared unheated room. Helped 30 minutes a day with housework; 30-minute ride to work.
31	Office.....	785.00	6.28	Apparently satisfactory.
28	United States (Bureau of Engraving and Printing).	631.68	6.37	Shared room with landlady's two daughters. Insufficient heat. Helped 30 minutes a day with housework.
45	Saleswoman.....	867.00	6.47	One roommate; 30-minute ride to work.
34	do.....	719.00	6.64	Apparently satisfactory.
28	Office.....	605.00	6.85	Do.
40	United States (Bureau of Engraving and Printing).	749.84	7.02	Do.
34	do.....	784.00	7.06	Apparently satisfactory; 45-minute ride to work.
34	United States (stenographer)	1,010.00	8.00	Apparently satisfactory.
31	United States (Bureau of Engraving and Printing).	721.00	8.19	Apparently satisfactory; 30-minute ride to work.
33	United States (Library).....	1,096.00	10.02	Apparently satisfactory; 40-minute ride to work.
35	do.....	1,014.00	11.66	Do.

(2) Commercial boarding houses.

Twenty-two of the self-supporting women visited were living in commercial boarding houses. The only ones who were paying under \$4 per week were 3 waitresses, each of whom received at least two meals daily at her place of employment. Only 1 of the 5 women paying \$4 and under \$5, was even fairly comfortably situated, and in this case the neighborhood was undesirable; in the other 4 cases there were very definite drawbacks.

Five women were paying \$5 and under \$6 per week, and of these only 1 seemed to be getting a fair standard of living. The remaining 9 women were paying between \$6 and \$8 weekly, and not more than 4, or less than half, had comfortable rooms and adequate food.

In this group the line of demarcation is not distinctly drawn, but clearly satisfactory accommodations in commercial boarding houses could not be obtained, except in occasional instances, for less than \$6 per week, and even at a weekly rate of from \$6 to \$8 comfortable food and lodging could not be assured.

Table 3 gives the details regarding the living conditions of this group of 22 women.

TABLE 3.—COST OF ROOM AND BOARD IN COMMERCIAL BOARDING HOUSES.

Age.	Occupation.	Annual income.	Weekly rate for food and lodging.	Character of accommodation.
20	Waitress.....	\$367.50	\$1.50	Received 3 meals daily at place of employment. Shared room with 3 sisters.
32	do.....	324.50	2.25	Received 2 meals daily at place of employment. Shared room with another girl.
21	do.....	491.00	2.38	Received 3 meals daily at place of employment.
21	Saleswoman.....	349.97	4.22	Took many of her meals with friends. Bought breakfast and lunch at store at reduced rate.
21	Office.....	469.83	4.24	One roommate. Helped 30 minutes a day with housework.
26	Saleswoman.....	480.48	4.55	One roommate.
19	do.....	423.50	4.75	Apparently satisfactory.
23	do.....	316.50	4.85	One roommate.
21	do.....	373.00	5.00	Very small, unheated room. No use of sitting room.
28	United States (Bureau of Engraving and Printing).	516.25	5.31	Apparently satisfactory.
24	Saleswoman.....	513.47	5.40	One roommate.
33	do.....	533.00	5.42	Not always sufficient heat.
36	United States (Bureau of Engraving and Printing).	547.75	5.73	One roommate. Thirty-minute ride to work.
35	Saleswoman.....	450.00	6.00	Very small room. No use of sitting room.
26	Office.....	711.00	6.15	Insufficient heat. One roommate.
42	Seamstress.....	407.00	6.39	No use of sitting room.
28	Office.....	575.00	6.50	One roommate.
29	United States (Bureau of Engraving and Printing).	584.32	6.55	Apparently satisfactory. Thirty-five minute ride to work.
35	do.....	620.00	6.78	Insufficient heat. Inconvenient to use sitting room.
40	Office.....	955.00	6.81	Unfurnished, but very large room.
24	do.....	539.00	6.97	One roommate.
32	Saleswoman.....	900.00	7.95	Small room. Insufficient heat.

(3) **Housekeeping.**

In this group are included all of the women visited who cooked at least one of their daily meals in their rooms or apartments. There were 54 self-supporting women coming within this group. Table 4 lists these 54 women according to the total weekly cost of room and meals combined.

The weekly costs among these women varied greatly—from \$2.03 to \$10.67. The tendency among the lowest-paid women living in this way seems to have been that of cutting down in every possible way on food in order to make the adjustments necessary to bring their expenditures within the range of their income. Thus, for the 13 women receiving an income below \$300 per year who chose to live in this way the dominant reason was doubtless that of economy. On the other hand, many of the women in higher income groups prefer this method of living since it brings a greater independence and a place they can call their own.

In analyzing the rates paid it may be noted that there were only 3 with expenses below \$3 a week and all 3 of these were provided with at least two meals a day at their place of employment. In the 8 cases of women with expenses of \$3 and under \$4 per week, 2 were furnished with extra meals, a third had free rent, another had a small room under the roof heated only by an oil stove, a fifth had a small, unheated room, a sixth had an unfurnished room which she heated with a gas stove, while the remaining 2 practically starved themselves in their efforts toward economy. Fourteen housekeeping women paid \$4 and under \$5 per week. Of these, 2 regularly had meals provided with their employment, 2 were invited out so much as to materially reduce their food expenditure; in 4 cases the rooms were unfurnished and in 4 cases the tenants had to provide their own heat. Of the remaining women who paid between \$4 and \$5, 2 lived with friends and 2 shared their apartments with relatives, paying a little less than half the total expense.

Of the 6 housekeeping women paying \$5 and under \$6 per week only 1 was able to provide adequate housing and food and she was sharing a 3-room apartment with her son. Sixteen women were paying \$6 and under \$8, and of these 13 were apparently comfortably situated, the majority sharing a small apartment with some friend or relative and sharing equally the expense. Thus, it seems quite evident that under normal circumstances at least \$6 a week was necessary for a housekeeping woman to maintain the minimum of decent comfort even when the utmost economy was practiced. The weekly expenditure shown for food and room was the expenditure at the end of the scheduled year, and in some cases exceeded

the weekly income. This meant that, at that particular time, the individual in question was living beyond her income.

TABLE 4.—COST OF ROOM AND BOARD FOR WOMEN HOUSEKEEPING.

Age.	Occupation.	Annual income.	Weekly expenditure for food and lodging.	Character of accommodation.
29	United States (charwoman).....	\$240.46	\$2.03	Earned two meals a day by extra work at hospital.
36	Waitress.....	551.00	2.81	Three meals a day six days a week received at place of employment.
24	do.....	440.00	2.82	Received two meals a day at place of employment.
65	Saleswoman.....	415.00	3.00	Free room in apartment of son-in-law.
49	Laundry.....	213.58	3.10	Shared room with daughter and grandson. No use of sitting room. Insufficient food.
59	Dressmaker.....	248.06	3.54	Room under roof, oil stove; one small window. No sitting room.
29	Saleswoman.....	258.00	3.57	Small, unheated room.
28	Waitress.....	339.00	3.68	Received two meals a day for 20 weeks and three meals for 26 weeks at place of employment.
36	Laundry.....	239.20	3.69	Went with insufficient food and clothing to care for children. No sitting room.
50	Factory.....	435.00	3.75	Received two meals a day while working 22 weeks as a dressmaker. No sitting room.
45	do.....	281.00	3.93	Unheated, unfurnished room. (Expenditure included price of fuel for stove.)
55	Laundry.....	253.33	4.00	Small, unheated room with friend. (Expenditure included price of fuel for oil heater.)
19	Saleswoman.....	323.00	4.00	One roommate. Shared small apartment with cousin, who paid a little more than half.
45	Factory.....	278.00	4.16	Small, unheated room. No sitting room. (Expenditure included price of fuel for oil stove.)
28	Office.....	726.50	4.42	Two roommates. Insufficient heat. Invited out to many meals.
49	Factory.....	361.00	4.50	Small, unfurnished room with friends.
32	Waitress.....	603.50	4.53	Shared three-room apartment with two other girls. Received two meals a day at place of employment.
22	do.....	336.00	4.58	One roommate.
27	Office.....	764.00	4.63	One roommate. Insufficient heat part of time. Invited out a great deal.
21	do.....	440.00	4.66	Shared three-room apartment with mother, who pays a little more than half.
21	Telephone.....	415.00	4.68	Large hall room with private family.
55	Dressmaker.....	394.00	4.73	Received lunch always where working and sometimes breakfast and supper.
55	Laundry.....	260.00	4.75	Unfurnished, unheated room. All clothing given second hand. (Expenditure included price of fuel for stove.)
35	Saleswoman.....	542.00	4.85	Unfurnished, unheated room. No sitting room. (Expenditure included price of fuel for stove.)
31	do.....	295.00	4.88	Unfurnished room with insufficient heat.
35	Laundry.....	238.10	5.00	Insufficient heat. (Oil stove.)
75	Factory.....	294.00	5.00	Unfurnished room in office building. No sitting room.
21	Saleswoman.....	261.91	5.05	Two roommates. No sitting room. (Gas stove for heating.)
45	Factory.....	409.00	5.08	Apparently satisfactory. Shared 3-room apartment with son.
58	do.....	385.75	5.11	No sitting room.
31	United States (Bureau of Engraving and Printing).....	553.70	5.73	Insufficient heat. One roommate after July.
40	do.....	726.18	6.06	Insufficient heat. Two roommates.
55	Factory.....	410.00	6.15	No sitting room.
50	do.....	415.00	6.26	Apparently satisfactory. Shared apartment with daughter.
45	Saleswoman.....	618.00	6.61	Apparently satisfactory. Shared apartment with sister.
23	United States (Library).....	520.00	6.79	Apparently satisfactory. Shared apartment.
26	Office.....	802.00	7.01	Apparently satisfactory. Shared apartment with mother.
26	do.....	681.00	7.04	Apparently satisfactory. Shared apartment with another girl.
45	do.....	550.00	7.06	Apparently satisfactory. Shared apartment with cousin who was partly dependent.
32	Saleswoman.....	603.65	7.14	Apparently satisfactory. Small apartment.
26	Laundry.....	595.60	7.18	Apparently satisfactory.

TABLE 4.—COST OF ROOM AND BOARD FOR WOMEN HOUSEKEEPING—Concluded.

Age.	Occupation.	Annual income.	Weekly expenditure for food and lodging.	Character of accommodation.
33	Telephone.....	\$603.69	\$7.52	Apparently satisfactory. Shared apartment with sister.
31	Office.....	765.00	7.55	Apparently satisfactory. One-room apartment with bath.
33	Saleswoman.....	782.00	7.60	Apparently satisfactory. Shared apartment with two sisters.
32	Factory.....	448.00	7.64	Unfurnished room nine months; apartment three months.
34	United States (Bureau of Engraving and Printing).	768.32	7.65	Apparently satisfactory. Shared apartment with two sisters.
35	do.....	546.11	7.88	Apparently satisfactory. Shared apartment. Thirty-five-minute ride to work.
29	Office.....	970.25	8.00	Apparently satisfactory. One-room apartment.
33	United States (operative)...	716.42	8.16	Apparently satisfactory. Shared apartment with friend.
55	Factory.....	494.00	8.22	Four unfurnished rooms over store. Had to provide own heat.
55	do.....	683.50	8.92	Apparently satisfactory. Shared apartment with niece.
52	United States (clerk).....	788.87	8.96	Apparently satisfactory. Shared apartment with daughter. Forty-five-minute ride to work.
54	Factory.....	600.00	9.12	Apparently satisfactory. Shared apartment with friend.
33	do.....	800.00	10.67	Apparently satisfactory. Two-room apartment alone.

(4) Working girls' homes.

Only 19 of the women scheduled were found to be living in working girls' homes. In the particular homes in which these women were living the rate for board and lodging was usually apportioned according to the wages received. Thus, the accommodation offered was usually considerably cheaper than could be obtained by these women in other places. That this form of living was so little availed of seems to have been due primarily to the fact that the total accommodation of such homes in Washington is very limited, as the homes in existence seemed to have been constantly full to capacity.

To determine this point with accuracy, a special survey of working girls' homes in Washington was made by the bureau in December, 1917, and a visit made to all of them with the exception of one which accommodated only 11 girls. In addition, a visit was made to the home recently established by the Telephone Co. for the accommodation of its operators brought in from other cities. This accommodates some 200 persons, but it is open only to telephone employees.

Excluding the Telephone Co.'s home, eight homes were found. The maximum number of persons they could accommodate was about 400.

Only two of these homes reported a majority of single rooms; the remaining 6 had nearly all double rooms and in several cases even three in a room. In two cases there were dormitories, each accommodating six women. All of the homes were heated by steam or

hot water except two, one of which had furnace hot-air heat, while the other had individual heating stoves. In all cases laundry privileges were allowed to some extent, but in only one place did the girls do all their own laundry, and in that instance they were charged a fee of 25 cents a month extra.

Sitting-rooms were provided in all these institutions and in most cases were very attractive, but in two instances were so cheerless that there could have been no pleasure in using them. Callers were allowed in all cases, with the requirement (except in two places) that they leave the building at a certain hour—10 p. m. in five cases, 11 p. m. in the remaining one. All girls were allowed to be out in the evening and in three cases were allowed to have a night key upon the payment of a 25-cent deposit; in all other cases they were let in by the matron after the doors were locked. In all cases, however, they were supposed to let the matron know when they expected to be out after certain hours, usually 10 p. m. The following table gives the name, location, restrictions, and rates for these eight homes:

TABLE 5.—WORKING GIRLS' HOMES IN WASHINGTON, IN DECEMBER, 1917.

Name.	Years in existence.	Number of girls accommodated.	Restrictions as to—			Rates.	
			Wage.	Age.	Religion.	Per week or month in 1917.	How determined.
Girls' Friendly ¹	5	24	{Low..	Under 25.	None..	\$3.50-\$7 week (3 meals).....	On salary.
Girls' Friendly Lodge.	(2)	20	{None..	25 35.....	do....		Flat rate.
St. Catherine's.	25	75	do....	None.....	do....	\$2.50 week-\$30 month (3 meals).	On salary.
St. Gertrude's.	1	19	do....	None ²	do....	\$3.50-\$5.50 week (3 meals)...	Do.
Sunshine Home	7	22	do....	None ⁴	do....	\$2.50 week (3 meals) ⁵	Flat rate.
W. C. A.....	49	52	do....	None ⁶	do....	\$5-\$5.50 week (2 meals) ⁷	\$5 for double rooms, \$5.50 for single rooms.
Y. W. C. A.....	(2)	⁸ 100	do....	Under 35.	do....	\$10-\$20 month for room, \$18 month for meals.	On room.
Y. W. C. H.....	30	77	do....	do....	do....	\$1.50 week-\$30 month.....	On salary.

¹ The Girls' Friendly is divided into two sections each accommodating 12 women.

² Less than one year.

³ Under 30 preferred.

⁴ Under 35 preferred.

⁵ \$2 week in 1916.

⁶ Under 40 preferred.

⁷ \$4 and \$4.50 in 1916.

⁸ 75 permanent; 25 transient. New building will accommodate 36 permanent and 8 transient.

EXPENDITURES FOR SICKNESS, AMUSEMENT, AND OTHER INCIDENTALS.

Food, clothing, and shelter demand the major portion of the income of every person of moderate wages or salary. But they do not exhaust even what may be termed the primary needs of human existence. Medical attention when sick and some amusement when well are certainly primary needs. The income of a working woman, as that of every other person, must be able to meet some expenditure

for these purposes, and also should be able to meet the costs of many other items, such as insurance, organization dues, car fare, gifts, etc.

The accompanying table (Table 6) indicates the amount and character of the expenditures made for all purposes other than food, clothing, and lodging, by the wage-earning women covered by this investigation. The data of the table are limited to those women, 137 in number, who were living away from home and who were entirely self-supporting. It is among such women, wholly dependent upon their own resources, that the matter of income apportionment is of particular interest and significance. A few of the more striking points of the table may be briefly commented upon.

Sickness.—Of the 137 women included, 93, or almost 70 per cent, had some expense for sickness during the year, the average for the whole group of 137 being \$14. The proportion of women having expenditures for sickness was fairly uniform in the different income groups. The average amount spent tended to increase with increasing income, but not as rapidly as with many other items. Thus, for those with incomes of less than \$300 per year, the average expenditure for sickness was \$11.74, while among those with incomes of \$800 to \$1,100 the average was \$18.31.

Amusements and vacation.—Expenditures for amusements averaged \$7.44 per year for the total group of 137 women, and expenditures for vacation averaged \$13.16. These amounts represent average weekly expenditures of only 14 cents and 25 cents, respectively, per individual. Both of these items tended to increase rapidly with increasing incomes, especially the item of vacation expenses. Of the 17 women with incomes of less than \$300 per year, only 4 reported any expenditures for vacation purposes, the average for this group being only \$1.56 per year. Among the women with incomes of \$800 to \$1,100, 12 out of the 13 scheduled reported vacation expenditures, the average being \$46.27.

Insurance.—Insurance was carried by almost 75 per cent of the 137 women, the average expenditure of the whole group being \$9.65.

Organizations.—Only 11 of the 137 women were members of labor organizations, and all of those were women with annual incomes of at least \$500.

School tuition.—Eleven women incurred expenses for school tuition during the year, all of these being women with incomes of at least \$500.

Car fare.—Car fare to and from work is unavoidable in the case of women living beyond a certain distance of their places of employment and must be spent at times by many other women. Eighty-three of the 137 women had such expenses, the average for the whole number being \$10.85.

Books and newspapers.—Expenditures for this item were very small. Of the 17 women with incomes under \$300 per year, only 6 reported any expenditures for this purpose, the average of all 17 being but 93 cents per year. Even for the women with incomes of from \$800 to \$1,100 per year, expenditures for reading matter averaged only \$4.71 per year, or less than 10 cents per week.

COST OF LIVING IN GERMANY, APRIL, 1916.

INTRODUCTION.

The enormous increase in the cost of living in Germany since July, 1914, has been one of the most discussed problems of the war. Vague statements as to the high cost of living have appeared in the daily press from time to time, but until the war committee on consumers' interests made two extensive investigations in April and July, 1916, no accurate data were available. When the results of these two investigations had been compiled the committee put them at the disposal of the Imperial Statistical Office (Division for Labor Statistics) which published a brief summary in the Reichs-Arbeitsblatt of February 23 and March 23, 1917.

PLAN OF THE INVESTIGATIONS.

During the month of April, 1916, the war committee on consumers' interests made for the first time an extensive investigation as to the cost of living of families residing in cities. About 4,000 schedules were distributed in the individual cities by local and district committees to families who had declared their willingness to cooperate in the investigation. The schedules consisted of two sheets marked A and B. The daily expenditures (in marks) and the weight (in grams) of the food purchased during the month of April were to be entered each day on sheet A. The daily expenditures and quantities purchased were to be added each week and the totals entered on sheet B and there added at the end of the month. In addition to the amounts

spent for food all expenditures for fuel, light, rent, taxes, clothing, laundry, household utensils, books, newspapers, transportation, physician, drugs, barber, insurance, membership fees, amusements, gifts, tips, etc., were also to be entered. Sheet B also contained questions as to the place of residence, occupation of the head of the family, number of persons composing the family (number of adults, children 1 to 10 years, and over 10 to 16 years old, and infants), and number of persons in the family having a regular gainful occupation and their earnings during April. The schedules were accompanied by detailed instructions as to the manner in which they were to be filled in, particular emphasis being laid on the urgent necessity of correctness in entering expenditures for food and the quantities of food consumed. The instructions also pointed out that only the proportionate amount properly chargeable to April for such items as rent, taxes, tuition fees, etc., should be entered on the questionnaire, and that expenditures for clothing should be computed similarly.

At the beginning of May the schedules numbering about 900 were collected by the committees and sent to headquarters where they were first thoroughly examined in order to determine the correctness or probability of the data relating to expenditures and quantities consumed. Incomplete or improbable data were supplemented whenever this was practicable. Otherwise they were discarded. Of the 900 schedules, 858 were found to be usable. Sheets A and B were examined to see whether the weekly entries corresponded to the totals of the daily expenditures. Special attention was paid to expenditures other than for food. Here it was found that in spite of the admonitions in the instructions the data for rent, taxes, and other expenditures in many instances covered quarterly or even half-yearly periods instead of only the month of April, as required. This was, of course, corrected. On the whole, however, the compilation was effected with the thought of making as few changes as possible in the original data, and of resorting to corrections only in case of evident errors which appeared from a comparison of sheets A and B.

The next task was the computation of the expenditures and of the quantities consumed per unit of consumption, arranged by income groups. After this was done, families of four persons were selected within the two largest income groups, that is, those with monthly incomes of from 100 to 200 and from 200 to 300 marks, and their monthly average expenditures and consumption computed by occupations. It should be mentioned that whenever the word income or income group is used here income from earnings only and not from other sources is meant.

In the computation of the expenditures per unit of consumption, children under 11 years of age were counted as half a unit within the

individual families. This method of computation is of course essentially less precise than the so-called computation by "quets," proposed by Engel and of late generally adopted in cost-of-living investigations, which considers the composition of families by age and sex, and the relative consuming powers of the different members. The quiet method could not be adopted in the present investigation because the schedules used distinguished only between children 1 to 10 and 11 to 16 years of age.

As has been mentioned, the number of usable schedules was 858. The 858 households to which these schedules related were composed of 4,079 persons, of which 2,261 were adults (over 16 years of age), 758 were children 11 to 16 years of age, 986 were children 1 to 10 years of age, and 74 were infants. The total number of units of consumption in these families was 3,733,¹ children under 11 years of age having been counted as half a unit.

The 858 households were distributed among the individual cities as follows: Four hundred and seventy-two families lived in 27 large cities each with a population of 100,000 or more; 279 families lived in 20 medium-sized cities each with a population of over 20,000 and less than 100,000; 107 families lived in 8 small cities each with a population of over 5,000 and less than 20,000. Thus more than half of the families included in the investigation lived in large cities.

According to their monthly income (earnings from work) the families were distributed in the following seven groups:

NUMBER OF FAMILIES AND UNITS OF CONSUMPTION, BY INCOME GROUPS.

Income group.	Number of families.	Units of consumption.
Less than 100 marks (\$23.80).....	25	65
100 marks (\$23.80) to 200 marks (\$47.60).....	319	1,249
Over 200 to 300 marks (\$47.60 to \$71.40).....	271	1,251
Over 300 to 400 marks (\$71.40 to \$95.20).....	139	685
Over 400 to 500 marks (\$95.20 to \$119).....	37	167
Over 500 marks (\$119).....	32	134
Income not stated.....	35	132
Total.....	858	3,733

¹ This is the total given in the report; how it was determined is not clear, since 2,261 units (adults) and 758 units (children 11 to 16 years of age) and 530 units (one-half of the total of children 1 to 10 years, and infants) make a total of 3,549 units.

The distribution of the 858 families according to the occupation of the head of the household was as follows:

NUMBER OF FAMILIES, BY OCCUPATION OF HEADS OF HOUSEHOLDS.

Occupation.	Number of families.
Higher Government employees.....	48
Medium-salaried Government employees.....	114
Low-salaried Government employees.....	63
Private salaried employees.....	166
Workmen.....	183
Free professions.....	22
Wives of soldiers.....	31
Not reported.....	231
Total.....	858

The majority of the families included in the investigation were middle-class families.

RESULTS OF THE INVESTIGATION.

The results of the investigation described above are given here in a series of general tables of which the following table shows the average expenditures per unit of consumption, by classified income, in actual and relative figures:

TABLE 1.—AVERAGE EXPENDITURES OF GERMAN FAMILIES DURING APRIL, 1916, FOR VARIOUS PURPOSES PER UNIT OF CONSUMPTION, BY CLASSIFIED INCOMES.

AMOUNT.

Object of expenditure.	Expenditures per family having classified amount of income.							Average expenditure all families (858 families; 3,733 units; 4.2 units per family).
	Under \$23.80 (25 families; 65 units; 2.6 units per family).	\$23.80 to \$47.60 (319 families; 1,249 units; 3.9 units per family).	Over \$47.60 to \$71.40 (271 families; 1,251 units; 4.6 units per family).	Over \$71.40 to \$95.20 (139 families; 685 units; 4.9 units per family).	Over \$95.20 to \$119 (37 families; 167 units; 4.5 units per family).	Over \$119 (32 families; 184 units; 5.7 units per family).	Income not stated (35 families; 132 units; 3.7 units per family).	
Food, beverages, etc.....	\$8.34	\$8.22	\$9.00	\$9.92	\$11.73	\$11.62	\$12.29	\$9.29
Rent.....	1.54	1.43	1.72	2.05	2.90	4.19	3.42	1.90
Clothing and laundry.....	1.31	1.38	1.60	1.98	2.60	2.60	1.93	1.70

Miscellaneous.....	3.35	2.36	3.42	5.25	6.96	8.36	7.73	4.29
Total.....	15.09	13.93	16.32	19.88	25.06	27.84	26.54	17.82

PER CENT.

Food, beverages, etc.....	55.22	59.00	55.13	49.87	46.81	41.74	46.28	52.14
Rent.....	10.20	10.23	10.57	10.33	11.59	15.03	12.89	10.67
Clothing and laundry.....	8.70	9.93	9.75	9.98	10.37	9.35	7.28	9.53
Fuel and light.....	3.64	3.88	3.54	3.42	3.47	3.83	4.41	3.61
Miscellaneous.....	22.22	16.96	20.98	26.40	27.76	30.04	29.14	24.05
Total.....	100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00

A study of the data shown in the preceding table reveals the striking fact that 52.14 per cent, or over one-half of the average total expenditures of the 858 families included in the investigation went for food. These figures are expressive of the food shortage during the war and of the consequent increased cost of the principal foodstuffs. According to the investigations of the Imperial Statistical Office of 1907¹ which related to families with a considerably smaller average income than that of the families considered in the present investigation, the average expenditures for food amounted to only 45.57 per cent of the total expenditures. In the low income classes the percentage of expenditures for food, as was to be expected, was much higher than the average percentage. In the income class of 100 to 200 marks (\$23.80 to \$47.60) it was 59 per cent and in the income class of 200 to 300 marks (\$47.60 to \$71.40) it was over 55 per cent, but even in the higher income classes the average was not less than 41.74 per cent while, according to the investigation of 1907, families in the higher income classes spent for food an average of only 36 per cent of their total expenditures. Not counting the miscellaneous group, expenditures for rent come next to food in importance. They amounted to between 10 and 16 per cent (average 10.67 per cent). The next largest item was clothing and laundry for which the average expenditure amounted to 9.53 per cent of the total expenditure.

In view of the scarcity and high cost of food in Germany during the war, the following table, which shows the average expenditure and percentage of expenditure for individual foodstuffs per unit of consumption, by classified income, is of special interest.

TABLE 2.—AVERAGE EXPENDITURES OF GERMAN FAMILIES DURING APRIL, 1916, FOR FOOD PER UNIT OF CONSUMPTION, CLASSIFIED BY MONTHLY INCOMES.

AMOUNT.

Item.	Expenditure per family having classified amount of income.

TABLE 2.—AVERAGE EXPENDITURES OF GERMAN FAMILIES DURING APRIL, 1916, FOR FOOD PER UNIT OF CONSUMPTION, CLASSIFIED BY MONTHLY INCOMES—Concluded.

PER CENT—Concluded.

Item.	Expenditure per family having classified amount of income.							Average expenditure, all families (888 families; 4.2 units per family).
	Under \$23.80 (25 families; 2.6 units per family).	\$23.80 to \$47.60 (319 families; 3.9 units per family).	Over \$47.60 to \$71.40 (271 families; 4.6 units per family).	Over \$71.40 to \$95.20 (139 families; 4.9 units per family).	Over \$95.20 to \$119 (37 families; 4.5 units per family).	Over \$119 (32 families; 5.7 units per family).	Income not stated (35 families; 3.7 units per family).	
1. Food consumed in the household—Concluded.								
Coffee substitutes.....	1.66	1.39	1.15	0.97	0.86	0.61	0.92	1.13
Nonalcoholic drinks, tea, etc.....	1.69	.82	1.33	1.18	1.54	1.32	1.73	1.18
Food substitutes.....	.90	1.11	.96	.74	.95	.77	1.52	.95
Other foodstuffs.....	2.02	1.99	2.09	1.81	1.12	1.82	1.42	1.88
Total.....	100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00
<i>Per cent of grand total.</i>								
1. Food consumed in the household.....	86.12	91.55	91.22	91.26	89.39	90.19	86.19	90.94
2. Alcohol, tobacco, cigars.....	2.83	3.76	3.78	4.08	5.34	3.79	4.94	3.92
3. Food and beverages consumed outside the household.....	11.05	4.69	5.00	4.66	5.27	6.02	8.87	5.14
Grand total.....	100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00

Of the expenditures for food consumed in the household those for meat and meat products come in first place. They form 18.5 per cent of the total so expended, and 21.8 per cent if conserved meat is included. The relatively large expenditures for conserved meat indicate the shortage of fresh meat which had already made itself felt in April, 1916, and thereafter became still more acute. The large expenditures for fish—3.2 per cent, and inclusive of canned fish, 4.5 per cent—which in peace times formed only 1 or at the most 2 per cent of the total expenditures for food, and the large expenditures for potatoes—nearly 6 per cent against 3 to 4 per cent in peace times—and jam which was used as a substitute for the very scarce butter, and bakery goods and cakes which had to supplement the scanty bread rations, and the large consumption of substitutes and preserved foods, are also significant of the changed standard of nutrition of the urban population brought about by the high cost of living and the shortage of foodstuffs during the war.

If the data shown in the preceding table are considered by income groups, it is found that the expenditures for conserved meat in contrast to those for fresh meat decrease with increasing income, indicating that even in April, 1916, the poorer classes of the population had begun to consume extensively conserved meat in preference to

the scarce fresh meat which could only be obtained at prohibitive prices. Among the financially better situated classes, on the other hand, the consumption of preserved vegetables increases with increasing income.

The expenditures for preserved foods and substitutes and for "other foodstuffs" participated in the total expenditures of the individual income groups for food consumed in the household with the following percentages:

PERCENTAGE OF EXPENDITURES FOR PRESERVED FOODS, FOOD SUBSTITUTES, AND "OTHER FOODSTUFFS," BY INCOME GROUPS.

Income group.	Per cent.
100 to 200 marks (\$23.80 to \$47.60).....	12.05
Over 200 to 300 marks (\$47.60 to \$71.40).....	13.05
Over 300 to 400 marks (\$71.40 to \$95.20).....	11.39
Over 400 to 500 marks (\$95.20 to \$119).....	10.94
Total average.....	12.20

The expenditures for tobacco and alcoholic beverages formed on an average about 4 per cent, and those for meals in restaurants, cafés, etc., about 5 per cent of the total expenditures for food and beverages.

The average quantities consumed per unit of consumption, classified by income, are shown in the following table. These data are of special value because in former cost of living investigations data as to quantities consumed were very rare and as a rule not very reliable. In peace times such data are harder to obtain from the individual housekeepers than during the present war when most of the important foodstuffs have been rationed by weight and more attention is paid to the quantities of food purchased because of the general scarcity. The report on the investigation states that the data as to quantities shown in the schedules have been examined very carefully before being compiled and that consequently it can be assumed that they represent as nearly as possible the actual quantities consumed. Food consumed away from home and not taken therefrom has not been included.

TABLE 3.—AVERAGE QUANTITIES OF FOODSTUFFS CONSUMED BY GERMAN FAMILIES DURING APRIL, 1916, PER UNIT OF CONSUMPTION, CLASSIFIED BY MONTHLY INCOMES.

[Not all families having furnished data as to quantities of all foodstuffs consumed, the number of units of consumption to which the data shown in the table relate are placed within parentheses.]

¹ Number.² Quarts.

The preceding table gives a true picture of the diet of the German urban population during the war. As to quantity of the individual foodstuffs consumed in April, 1916, potatoes come in first place, the 858 families included in the investigation having consumed 16.79 kilograms (37 pounds) of potatoes per unit of consumption, a consumption twice as large as that of bread and rolls combined which is due partly to the reduced bread ration. The consumption of vegetables and fruit, fresh and preserved, with 2.57 kilograms (5.7 pounds), comes in third place, and that of fresh and conserved meat with 1.90

kilograms (4.2 pounds) in fourth place. The consumption of fish was nearly half that of meat, showing a considerable increase as compared with peace-time consumption. An analysis of the data for the individual income groups corroborates the well-known fact of decreased consumption of potatoes and bread and increased consumption of meat in the groups with higher incomes. It also shows that the consumption of vegetables, fresh and preserved, jam, sugar, cocoa, and sweets, increases with increased income. With the exception of the lowest income group the consumption of cheese was nearly the same in all income groups.

The consumption of preserved foods in the various income groups was the following:

CONSUMPTION OF PRESERVED FOODS, BY INCOME GROUPS.

Income group.	Pounds.
100 to 200 marks (\$23.80 to \$47.60).....	2.92
Over 200 to 300 marks (\$47.60 to \$71.40).....	3.77
Over 300 to 400 marks (\$71.40 to \$95.20).....	3.57
Over 400 to 500 marks (\$95.20 to \$119).....	4.01
Average.....	3.60

The expenditures for all items and the consumption of food of families of 4 persons of the two largest income groups, those relating to incomes of 100 to 200 marks (\$23.80 to \$47.60) and of over 200 to 300 marks (\$47.60 to \$71.40) arranged by occupations of the heads of the families are shown in the four tables which follow:

TABLE 4.—AVERAGE EXPENDITURES FOR APRIL 1916, OF SELECTED GERMAN FAMILIES OF FOUR PERSONS WITH A MONTHLY FAMILY INCOME OF 100 TO 200 MARKS (\$23.80 TO \$47.60), BY OCCUPATION OF HEADS OF FAMILIES.

[The figures in this table are taken from the original report. In that report the average total expenditure per family of all of the 57 families included in the table is given as 222.05 marks (\$62.85), which does not correspond to the average of the totals shown for the individual occupational groups. On the basis of the latter the average expenditures per family of all the 57 families would be only 217.39 marks (\$61.74).]

Object of expenditure.	Low-salaried Government employees (19 families).	Private salaried employees (6 families).	Workmen (16 families).	Occupation not stated (16 families).	Average (57 families).	
					Amount.	Per cent.
Food and beverages consumed in and outside of the household.....	\$31.21	\$29.51	\$33.30	\$30.09	\$31.51	59.60

Wages, tips.....	.05	1.61	.18		.86	1.63
Miscellaneous.....	1.67	1.56	.70	1.04	1.17	2.32
Total.....	53.09	51.19	52.19	49.88	52.85	100.00

The monthly average of expenditures for April, 1916, of a family of four persons with a monthly family income of from 100 to 200 marks (\$23.80 to \$47.60), amounted to 222.05 marks (\$52.85) according to the preceding table. This means that on an average all families coming within the above classification lived beyond the income derived from their earnings and that the deficit of their budget had to be covered from other sources of income or from their savings, while families having neither other sources of income nor savings were forced to contract debts in order to obtain the necessities of life. The report states that in view of the greatly increased cost of living it seems very probable that in the lowest income group the living expenses exceeded the income from earnings.

The expenditures for food, beverages, etc., of a family of four persons of the income group considered in the table were 132.36 marks (\$31.51), those for rent 22.76 marks (\$5.41), for heat and light 8.20 marks (\$1.95), for clothing, shoes, and repairs 16.95 marks (\$4.03), for laundry, soap, and soda 5.09 marks (\$1.21), and for taxes 4 marks (95 cents). The expenditures for books, newspapers, etc., amounted to 2.92 marks (69 cents) and those for amusements and sports to only 1.10 marks (26 cents). The report observes that the figures for these two items furnish gratifying proof that the families in this income group preferred reading to amusements. The expenditures for insurance, medical treatment, and drugs, amounting to 4.71 and 3.80 marks (\$1.12 and 90 cents), respectively, were relatively large. Membership in trade and professional unions required a monthly outlay of 2.74 marks (65 cents). That the expenditures for gifts reached the relatively large amount of 3.52 marks (84 cents) is to be explained by the fact that nearly all families have relatives in the army or navy to which gifts were frequently sent by parcel post.

An analysis of the expenditures of these families by occupational groups shows that families of low-salaried Government employees spend less for food than workmen's families but more for rent, clothing, shoes, books, newspapers, medical treatment and drugs, baths, shaving, and hair cutting. The table also shows that workmen's families make the largest expenditures for amusements and sports and salaried employees' families the smallest.

The expenditures for and the consumption of food of the families considered in the preceding table are itemized in the following table:

TABLE 5.--EXPENDITURES FOR AND CONSUMPTION OF FOOD DURING APRIL, 1916, OF SELECTED GERMAN FAMILIES OF FOUR PERSONS WITH A MONTHLY FAMILY INCOME OF 100 TO 200 MARKS (\$23.80 TO \$47.60), BY OCCUPATIONS OF HEADS OF FAMILIES.

[The totals in this table are not in all cases equal to the sum of the items, but they and the items are the exact equivalents of the figures in the original report. No explanation of the discrepancy is given.]

1 Number.

2 Quarts.

A family of four persons of the income group considered in the preceding table expended on an average nearly 124 marks (\$29.51) for food consumed in the household. Of this amount 23.72 marks (\$5.65) went for meat and meat products, inclusive of 3.43 marks (82 cents) expended for conserved meat, 16.87 marks (\$4.02) for butter and fats, and 16.07 marks (\$3.83) for bread and bakery goods. The expenditure for potatoes was 8.28 marks (\$1.97), for eggs 8.21 marks (\$1.95), for milk 8.06 marks (\$1.92), for fish, fresh smoked, and conserved, 5.33 marks (\$1.27), for cheese 2.89 marks

(69 cents), and for fresh and preserved fruit and vegetables 6.04 marks (\$1.44). The total expenditure of the family for conserved food and food substitutes inclusive of coffee substitutes and other foodstuffs amounted to 14.20 marks (\$3.38).

The distribution of the expenditures for food within the individual occupational groups shows the following facts: The expenditures of workmen's families for bread and rolls, potatoes, and butter and fats were larger than the expenditures of low-salaried Government employees' and private employees' families for the same commodities. The expenditures of workmen's families for meat were larger than those of low-salaried Government employees' and smaller than those of private employees' families, while their expenditures for fish, eggs, jam, sugar, and coffee (inclusive of coffee substitutes) were larger than those of families of the other two occupational groups. The expenditures for food consumed away from home (in restaurants, etc.) were very considerable in the case of low-salaried Government employees. The consumption of the individual foodstuffs corresponded as a rule to the expenditures. The relative quantitative importance of the individual foodstuffs consumed in urban households has already been discussed.

The average monthly expenditures of families of four persons of the income group of over 200 to 300 marks (\$47.60 to \$71.40), by occupational groups, is shown in Table 6, as follows:

TABLE 6.—AVERAGE EXPENDITURES FOR APRIL, 1916, OF SELECTED GERMAN FAMILIES OF FOUR PERSONS WITH A MONTHLY FAMILY INCOME OF OVER 200 TO 300 MARKS (\$47.60 TO \$71.40), BY OCCUPATION OF HEADS OF FAMILIES.

[The totals in this table are not in all cases equal to the sum of the items, but they and the items are the exact equivalents of the figures in the original report. No explanation of the discrepancy is given.]

The average expenditures of a family of four persons of the income group of over 200 to 300 marks (\$47.60 to \$71.40) amounted to 290.35 marks (\$69.10). Although this amount is not so large as the highest income within the income group considered, it nevertheless indicates that a number of families in this group had lived beyond their income from earnings. Deficits in the household budgets of these families, which must have occurred frequently, were probably covered through expenditure of previous savings or through contraction of debts. Expenditures for food, amounting to 157.08 marks (\$37.39), formed more than half of the total expenditures. The expenditures for rent with 33.60 marks (\$8), for clothing, etc., with 23.38 marks (\$5.56), and heat and light with 11.69 marks (\$2.78) were the next largest items in the order named. The disbursements for insurance and gifts of 9.35 and 7.79 marks (\$2.23 and \$1.85), respectively, were also relatively large.

Considered by occupations the data shown in Table 6 again indicate that workmen's families spend more for food than salaried employees' families, but less for rent, clothing, books and newspapers, and for insurance. That their expenditures for insurance are seemingly smaller is probably due to the fact that the insurance premiums are generally deducted from their wages. In spite of the fact that the income of the workmen's families included in the table is generally lower than that of the families of Government and private employees, the disbursements of the former for dues to societies are considerably larger than those of the latter.

The average monthly expenditures for food are shown in detail in the following table for the same families as are considered in the preceding table.

TABLE 7.—EXPENDITURES FOR AND CONSUMPTION OF FOOD DURING APRIL, 1916, OF SELECTED GERMAN FAMILIES OF FOUR PERSONS WITH A MONTHLY FAMILY INCOME OF OVER 200 TO 300 MARKS (\$47.60 TO \$71.40), BY OCCUPATIONS OF HEADS OF FAMILIES.

[The totals in this table are not always equal to the sum of the items, but they and the items are the exact equivalents of the figures in the original report. No explanation of the discrepancy is given.]

¹ Number.

² Quarts.

Of the individual items of the average family expenditures for food shown in Table 7 those for meat and meat products (inclusive of conserved meat), amounting to 32.27 marks (\$7.68), are much larger than the corresponding items in Table 5 for the next lowest income group. The average expenditures for bread and other bakery goods amounted to 17.22 marks (\$4.10), and nearly the same amount, 17.27 marks (\$4.11), was expended for butter and fats. The expenditure for potatoes, 8.28 marks (\$1.97), is the same as in Table 5. The total

expenditure for preserved foods and food substitutes and "other food-stuffs" was 16.61 marks (\$3.95) per family.

Of families with a monthly income of over 200 to 300 marks (\$47.60 to \$71.40) those of medium-salaried Government employees made the largest expenditures for fresh meat and the smallest expenditures for conserved meat. The expenditures for bread and rolls and fats and butter were largest in the case of workmen's families. Workmen's families also were the largest consumers of milk, but their expenditures for milk were smaller than those of the other occupational groups, which indicates that they must have consumed more skimmed milk than the latter. Of all occupational groups Government employees' families made the smallest expenditures for alcoholic beverages, tobacco, and meals in restaurants.

THE INVESTIGATION OF JULY, 1916.

In July, 1916, the War committee on consumers' interests made a second cost of living investigation. With the exception of a few unimportant alterations the schedule used was the same as that used in the April investigation. The same method of compilation was also employed, but only expenditures for food were considered, as it was rightly assumed that all other expenditures could not have undergone any noteworthy change during the relatively short period of three months. The schedules of 146 families with 644 persons and 601 units of consumption were included in the compilation. Most (101) of the households included were in large cities, 39 were in medium-sized, and only 6 in small cities. Only the following three income groups were considered:

100 to 200 marks (\$23.80 to \$47.60).....	46 families.
Over 200 to 300 marks (\$47.60 to \$71.40).....	50 families.
Over 300 marks (\$71.40).....	50 families.

According to the occupation of the head of the family the families included in the investigation were distributed as follows: Higher salaried Government employees, 22; medium-salaried Government employees, 36; private salaried employees, 31; workmen, 48; and free professions, 9. As in the April investigation, most of the families included, therefore, belonged to the middle classes.

Lack of space does not permit a reproduction in the MONTHLY REVIEW of the full results of this second investigation. For this reason it can only be mentioned here that the average expenditure per family for food was 43.19 marks (\$10.28) in July, 1916, as against 39.04 marks (\$9.29) in April, indicating an increase of 10.63 per cent for this three-month period.

WAGES AND HOURS OF LABOR IN THE IRON AND STEEL INDUSTRY, SEPTEMBER, 1917, COMPARED WITH MAY, 1915.

BY N. C. ADAMS.

The average earnings per hour of employees in the principal productive occupations of six departments of the iron and steel industry had increased, in September, 1917, as compared with May, 1915, as follows: In blast furnaces, 52 per cent; in Bessemer converters, 58 per cent; in open-hearth furnaces, 38 per cent; in blooming mills, 35 per cent; in plate mills, 50 per cent; and in sheet mills, 95 per cent. Full-time hours per week had changed very little in these 29 months, and full-time earnings per week had increased in the same proportions as the earnings per hour in four of the six departments, with an additional 3 per cent increase in the two remaining departments—open-hearth furnaces and sheet mills.

Many of the companies furnishing information for this report have notified the Bureau that they granted a further increase of 10 per cent in rates of pay to their employees in October, 1917, and it is believed that all of the companies represented joined in this additional increase. Hence the reader should bear in mind that even the very high figures here exhibited do not portray the full extent of the great increase in wages of iron and steel workers as a result of the War.

An additional evidence of the further increase in October, 1917, is furnished by the following statement prepared from figures in the February, 1918, issue of the MONTHLY REVIEW. The figures refer to entire plants instead of to selected departments as do the tables of this report, but the general trend is not especially disturbed by that fact. It will be seen that the index numbers for per capita earnings for the entire plants show an increase of 26 points, or 16 per cent, in October, 1917, as compared with the preceding month.

INDEX NUMBERS SHOWING VARIATIONS IN THE NUMBER OF PERSONS ON THE PAY ROLL, IN THE AMOUNTS OF SUCH PAY ROLLS, AND IN PER CAPITA EARNINGS—IRON AND STEEL.

[January, 1915 = 100.]

Date.	Number on pay roll.	Amount of pay roll.	Per capita earnings.
January, 1915.....	100	100	100
May, 1915.....	111	120	108
December, 1916.....	160	234	146
September, 1917.....	179	290	162
October, 1917.....	182	343	188

This bureau's latest bulletin on Wages and Hours of Labor in the Iron and Steel Industry (No. 218), issued in January, 1918, is a comprehensive study of general working conditions in the industry during the period extending from May, 1913, to June, 1915.

The three outstanding phases of that period were: First, the high rates of wages in May, 1913, which resulted from the industry's activities during the early part of that year; second, the steadily decreasing pay rolls of the remainder of 1913 and the entire year of 1914, the first year of the War; and, finally, the slowly improving conditions during the spring of 1915 resulting from the beginning of the War demands. Earnings per hour, however, in May, 1915, still were below those of May, 1913.

Bulletin 218 also presents some text and tabular statements compiled from issues of the MONTHLY REVIEW which clearly indicate the great increases in employment and in rates of pay which occurred between May, 1915, and December, 1916. The difference between the index numbers for per capita earnings for May, 1915, and December, 1916 (see preceding table), is 38, or an increase of 35 per cent for the latter month.

Bulletin 218 also contains a reference (October, 1917) to further increases shown by later data in the bureau's possession, but at that time uncompiled. The information referred to forms the basis of this brief report. It was furnished by various iron and steel companies in the United States and is for the pay-roll period ending September 15, 1917. It is presented here coupled, for the purpose of comparison, with similar data from identical plants, taken from the report for May, 1915 (Bulletin 218). A comparison between the index numbers for per capita earnings for May, 1915, and September, 1917, as shown in the preceding table, shows a gain of 54 points, or 50 per cent, in the last-named month.

This report embraces statistics for blast furnaces, Bessemer converters, open-hearth furnaces, blooming mills, plate mills, and sheet mills, so far as these departments are represented in sufficient numbers to form a basis for comparison, in the Eastern, Pittsburgh, Great Lakes and Middle West, and Southern districts of the United States. While the number of plants included is somewhat smaller than the number heretofore represented in the series of iron and steel wages bulletins, the report is sufficiently comprehensive to give a fair exposition of the phenomenal increases in earnings of iron and steel workers in 1917 as compared with 1915 and with pre-War periods.

Actual rates of wages per hour, full-time hours per week, and full-time earnings per week for the principal productive occupations of each of the six departments covered are shown in the table on pages 41 to 51, for identical plants, for September 15, 1917, and May 15, 1915.

These figures, together with similar figures for previous years taken from Bulletins 218, 168, and 151, are summarized in the form of relative numbers, which show the trend of wages and hours from year to year in each occupation and in each department as a whole. This table of relative numbers appears on pages 34 to 39, and the relatives for each department as a whole are reproduced in the table on page 32.

The heavy-faced figures of the following table are relative or index numbers and are simply percentages computed from the actual figures. In computing the index numbers the actual figures for 1913 are taken as the base, or 100 per cent; thus the facts for each other year reported are brought into direct comparison with the facts for the last complete year before the War.

Referring to the weekly-earnings column of the table for blast furnaces, it is seen that while such earnings in 1913 were higher than in any year of the period 1907 to 1915, inclusive, in 1917 they had increased 47 per cent as compared with 1913 and 52 per cent as compared with 1915. The greatest increase in weekly earnings is that shown for employees in sheet mills, whose weekly earnings in 1917 were 88 per cent higher than in the pre-War year 1913, 98 per cent higher than in 1915, and 119 per cent higher than in 1910. In computing the per cents of increase or decrease, other than those of each year with the year preceding, 1917 was used as a basis for comparison, as that is the first year shown in this report which reflects the very great War increases in rates and earnings.

RELATIVE FULL-TIME HOURS PER WEEK, WAGES PER HOUR, AND WEEKLY EARNINGS, TOGETHER WITH PER CENT OF INCREASE OR DECREASE, IN SPECIFIED YEARS, BY DEPARTMENTS.

1 No change.

COMMON LABORERS.

The rate of wages paid common laborers is to a large extent a basic rate from which are determined the rates for other occupations requiring little skill, hence the rate for common labor is of importance beyond the limits of the occupation proper. The rate per hour of common labor is practically the same in all the departments of a plant, but the earnings per day or week, of course, are determined by the number of hours worked.

The following table shows, for each district, the average hourly rate paid to common laborers in each of the departments covered in this report.

AVERAGE RATES PER HOUR OF COMMON LABORERS IN EACH DEPARTMENT, BY DISTRICTS, 1915 AND 1917.

District and year.	All departments.	Blast furnaces.	Bessemer converters.	Open-hearth furnaces.	Blooming mills.	Plate mills.	Sheet mills.
Eastern:							
1915.....	\$0.151	\$0.157		\$0.151	\$0.160	\$0.147	
1917.....	.278	.271		.287	.250	.250	
Pittsburgh:							
1915.....	.190	.186	\$0.190	.198	.187	.188	\$0.191
1917.....	.301	.292	.299	.300	.300	.300	.321
Great Lakes and Middle West:							
1915.....	.190	.195	.191	.192	.190	.187	.180

1917.....	.222	.226		.221	.217		
Total:							
1915.....	.184	.182	.190	.187	.182	.172	.186
1917.....	.298	.281	.298	.292	.287	.294	.331

INDEX NUMBERS.

Relative or index numbers for each of the principal productive occupations in each of the six departments covered by this report appear in the following pages, (34 to 39). As before stated these index numbers are simply percentages computed from the actual figures of earnings and hours, the figures for 1913, the last complete year before the War, being used as the base or 100 per cent.

Blast furnace employees with the exception of blowers are paid an hourly or a daily rate, and there is a decided uniformity in the increases in earnings of 1917 over 1913 as shown by the relative numbers. But in the other departments, with the exception of sheet mills, while the uniformity is still apparent in the relative numbers for laborers and other unskilled or semiskilled employees who, for by far the greater part, are paid time rates, there is a perceptibly smaller increase shown in the relative numbers for the highly skilled tonnage workers. Sheet mills on the other hand show a smaller increase in weekly earnings for laborers than for the very highly skilled other employees in the rolling gang. These laborers' earnings, however, show a greater relative increase than do laborers in any of the five other departments.

The increases for the sheet mill department are the greatest brought out by this report, weekly earnings for all occupations combined being 98 per cent higher in 1917 than in 1915.

RELATIVE FULL-TIME HOURS PER WEEK, RATES OF WAGES PER HOUR, AND FULL-TIME WEEKLY EARNINGS, 1907 TO 1917,¹ BY OCCUPATIONS.

BLAST FURNACES.

¹ Except 1916; no data for that year were gathered.

The working time of employees, as shown in the following table of average hours and wages, is not always the working time of their occupation as a whole. Some plants make provision for laying off one day a week each employee working in a department which operates seven days per week, as blast furnaces, for example. In such plants the full-time hours per week of an employee working 12 hours a day is 72 hours. In a plant making no such provision, the full-time hours per week of an employee working 12 hours a day is 84 hours.

In the 18 blast furnaces covered by this report 56 per cent of the employees shown worked 7 days per week in 1915 and 8 per cent 6 and 7 days alternately, while only 50 per cent worked 7 days in 1917, and 6 per cent worked 6 and 7 days alternately. The remaining 36 per cent in 1915 and 44 per cent in 1917 worked 6 days. This shows a reduction of 6 per cent in the number of 7-day workers between May 15, 1915, and September 15, 1917, and is a reduction of 47 per cent between May 15, 1907, when 97 per cent of the blast furnace employees reported worked 7 days each week, and September 15, 1917.

The rates of wages per hour appearing in the table include both the wages of time workers and the earnings of tonnage or piece workers. All time rates by the day or week have been reduced to rates per hour. The earnings of tonnage workers, the earnings of employees working at both time and tonnage rates, and the earnings of employees who, in addition to a regular time rate, receive a bonus based on production, also have been reduced to earnings per hour by dividing the earnings by the hours worked. The time workers and tonnage workers of each occupation are combined as one group.

In this connection it should be noted that while in other industries the earnings of employees paid on a piecework basis usually are proportionate to the exertion and skill of the individual employee, in the iron and steel industry the earnings of tonnage workers depend upon the production of an entire department or group of employees.

The average rates of wages per hour given are true averages. In the majority of cases the very great variation in the rates of a district are the results of a variation in the custom of working two or three shifts per day. Employees who are put on a three-shift (8 hour) basis naturally demand an hourly rate which will approximately equalize their daily earnings with those of men on a two-shift (12 hour) basis.

Average weekly earnings also are true averages, aggregate weekly earnings having been computed for employees of each plant separately, and the total, for all plants combined, divided by the total number of employees. Multiplying the average hours per week by the average rate per hour will not always give the same average

weekly earnings as the true average, especially in cases where there are extreme variations between the several plants in either rates or hours.

Rates of pay are highest usually in the Pittsburgh and Great Lakes and Middle West districts, and in general it appears that there is a great similarity between rates in these two districts. Rates in the Eastern district are decidedly lower and those in the Southern district as a whole still lower.

One general exception, however, should be noted for the Southern district. The rates of some highly skilled occupations are as high as in any of the other districts. The reason for this condition is said to be that employees in these occupations, for a large part, are brought from the northern districts and will not accept a lower rate than they formerly received, and in some cases will not go to the warmer climate, to which they are not accustomed, unless they are given a higher rate even than that paid in the Pittsburgh or the Great Lakes district. On the other hand, occupations requiring little skill, including common laborers, are recruited to a great extent from the Negroes, who are paid less than the whites in the same occupation.

The lower rates paid in the Eastern district are in a measure due to the fact that many of the plants are located in small cities and towns where living costs, especially housing, are less than in the congested centers of the Pittsburgh and Great Lakes districts.

The table of average earnings and hours for the principal productive occupations in each department follows:

AVERAGE FULL-TIME HOURS PER WEEK, RATES OF WAGES PER HOUR, AND FULL-TIME WEEKLY EARNINGS, IN EACH DISTRICT, 1915 AND 1917.

REPORT OF PRESIDENT'S MEDIATION COMMISSION.

In the December, 1917, issue of the MONTHLY REVIEW (pp. 53-57) mention was made of the appointment by the President of a commission to visit the mountain region and the Pacific coast for the purpose of learning the causes of discontent in that section and of "lending sympathetic counsel and aid * * * in the development of a better understanding between laborers and employers and also themselves to deal with employers and employees in a conciliatory spirit, seek to compose differences and allay misunderstanding, and in any way that may be open to them to show the active interest of the National Government in furthering arrangements just to both sides." It seems that the immediate anxiety was on account of the dangerous diminution of the copper supply available for ammunition, due partly to the strikes in Arizona, and the hampering of the War program both as to ships and aircraft because of disturbed labor conditions in the Pacific Northwest, so that primarily the objects of the commission were to work the copper mines of Arizona to their maximum output and to keep them open for the period of the War, and to bring to pass such a condition in the labor situation of the Pacific Northwest that the shipbuilding and aircraft programs of the Nation may proceed at the required pace and with efficiency so far as labor is an element. The work of the commission, however, was not confined to these two specific fields, for after it began its labors other difficulties arose which demanded its attention, namely, a threatened strike in the oil fields of southern California, a threatened and partly executed strike on the telephone lines of the Pacific States, and a threatened tie-up of the packing industry centering in Chicago but affecting the industries of the entire country. The article in the December REVIEW dealt particularly with the unsettled labor conditions and the achievements of the commission in bringing about adjustments in the Arizona copper fields. A subsequent article, in the January issue of the MONTHLY REVIEW (pp. 13-17), included the report of the commission condemning the deportation on July 12, 1917, of 1,186 men from Bisbee, in the Warren copper district of Arizona.

In abstract form the report of the commission submitted to the President under date of January 9, 1918, and made public on February 10, contains a statement of the labor disturbances in the copper fields, and a summary of the adjustments effected by the commission,

followed by a comprehensive outline of the efforts put forth by the commission in bringing about a settlement of the California oil fields dispute, the Pacific coast telephone dispute, and the packing industry dispute. The report also includes a brief statement of conditions disclosed to the commission leading to unrest in the lumber industry of the Pacific Northwest. Following these summary statements of the results of specific labor adjustments undertaken by the commission is an analysis, so far as revealed by the limited scope of the investigation, of the difficulties and tendencies making for industrial instability, and the report concludes with recommendations as to the direction that the labor policy of the United States should take, at least during the period of the War, and is signed by W. B. Wilson, Secretary of Labor, chairman; Ernest P. Marsh; Verner Z. Reed; Jackson L. Spangler; and John H. Walker.

DISPUTES IN ARIZONA COPPER DISTRICTS.

Fundamental causes of the labor disturbances in 1917 in the Arizona copper fields, where about 28 per cent of the total copper output of the United States is produced, were found by the commission to be (1) "the underlying labor conditions of the mining industry of the State, which were devoid of safeguards against strikes and in fact provocative of them," and (2) distant ownership of mines and the failure on the part of the resident managers "to understand and reach the mind and heart of labor because they have not the aptitude or the training or the time for wise dealing with the problems of industrial relationship. The managers are technical men, mining engineers of knowledge and skill. There is no responsible executive whose sole function it is to deal with labor problems."

The facts that the working force is migratory, constituting "economically an intolerable waste," that many nationalities (26 in one camp and 32 in another) are represented in each camp, and that "the movement toward Americanization, so fruitful in its results in different parts of the country, has hardly penetrated into these outposts of industry," have apparently contributed to the unsettled conditions which the commission found in the copper fields. Conditions varied somewhat in the four districts covered, but amidst all the diversities there were three basic claims, urged by the men and resisted by the companies, which are given in the report as follows:

(a) While not expressed in so many words, the dominant feeling of protest was that the industry was conducted upon an autocratic basis. The workers did not have representation in determining those conditions of their employment which vitally affected their lives as well as the company's output. Many complaints were, in fact, found by the commission to be unfounded, but there was no safeguard against injustice except the say so of one side to the controversy. In none of the mines was there direct dealing between companies and unions. In some mines grievance committees had been recently established, but they were distrusted by the workers as subject to

company control, and, in any event, were not effective, because the final determination of every issue was left with the company. In place of orderly processes of adjustment, workers were given the alternative of submission or strike.

(b) The men sought the power to secure industrial justice in matters of vital concern to them. The power they sought would in no way impinge on the correlative power which must reside in management. Only by a proper balance of adequate power on each side can just equilibrium in industry be attained. In the minds of the workers only the right to organize secured them an equality of bargaining power and protection against abuses. There was no demand for a closed shop. There was a demand for security against discrimination directed at union membership. The companies denied discrimination, but refused to put the denial to the reasonable test of disinterested adjustment.

(c) The men demanded the removal of certain existing grievances as to wages, hours, and working conditions, but the specific grievances were, on the whole, of relatively minor importance. The crux of the conflict was the insistence of the men that the right and the power to obtain just treatment were in themselves basic conditions of employment, and that they should not be compelled to depend for such just treatment on the benevolence or uncontrolled will of the employers.

The correction of these underlying conditions making for instability was the aim of the commission in its adjustments. Although four specific adjustments were made, the general principles incorporated in the agreements were as follows:

(a) An orderly and impartial process for the adjustment of all grievances inevitable in modern large-scale industry was substituted for the strike. In asking labor, for the period of the War, to forego its ultimate weapon, a compensatory means of redressing grievances had to be supplied. Therefore, there are established in each district United States administrators to decide all disputes where the parties themselves fail of agreement. The commission in effect applied the principle of trade agreements, making the duration of the War the time limit, and, through the mechanism of a United States administrator, provided for the means of determining any claims of breach of the agreement.

(b) Working conditions of industry should normally be determined by the parties themselves. Therefore channels of communication between the management and men were created through grievance committees free from all possible company influence. Through these representative contacts between management and men disputes find expeditious and informal settlement. Still more important, the contact engenders a spirit of mutual understanding and therefore of cooperation.

(c) The right of the men to organize was made effective by providing administrative enforcement for the prohibition against discrimination because of union affiliation.

(d) In view of the dislocation of the labor supply of the country it was important to husband the available man power. Therefore reemployment of the men on strike before employing newcomers was assured, excepting only those—few in number—who were guilty of seditious utterances, who had been proved inefficient, or who were members of any organization whose principles were opposed to belief in the obligation of contract. By casting the burden of reemployment of all the strikers upon the district instead of upon the individual company, the beginning was made toward recognizing the responsibility of the industry as an entirety for the solution of its problems.

The report says that administration under this settlement has proceeded in these Arizona districts for over two months and the results are encouraging.

CALIFORNIA OIL FIELDS DISPUTE.

In the oil fields of southern California, where the output is 8,000,000 barrels per month and the number of employees is approximately 18,000, a threatened strike in the fields of independent companies in the summer of 1917 and again in the following November, directed the attention of the commission to an adjustment of differences which concerned wages, hours, conditions of employment, and alleged discrimination against the men because of membership in the union which had been organized in April, 1917, and had grown to include between 9,000 and 10,000 men. The commission found that the major specific demands of the men, a very large proportion of whom are highly skilled, were for an 8-hour day and a minimum wage of \$4, it appearing that 5,000 employees of a certain company had been on an 8-hour basis since January 1, 1917. The commission succeeded in obtaining an 8-hour day for the employees of the independents, effective January 1, 1918, conditioned on the right of the Government to demand a longer working day should emergency require it, and in establishing the principle of the minimum wage of \$4 on an 8-hour basis, effective December 1, 1917. The companies further agreed not to discriminate against men because of membership in any union affiliated with the American Federation of Labor. In the oil fields, as in the copper districts, machinery for adjustment of disputes was essential, and provision was therefore made for Government inspectors to determine the Government's need, if any, for increase in the working hours. Administrators were named for all disputes which the parties themselves can not settle. The report says in conclusion:

The men thus secured betterment in hours and conditions of employment and the means of redress for future grievances. In effect the settlement operated as a trade agreement for the period of the War and thereby displaced the strike and the lockout. The Government is thus assured stability as to labor conditions in the oil production of California. Opportunities are afforded the men to become disciplined through responsible organization, with resulting increase in efficiency; and the contact between producers and men will make for the healthier relationships between them indispensable to peace and productivity in industry. The response to the Government's needs, once they were made clear to both operators and men, gives full hope for the growth of a cooperative spirit between them. The men showed every readiness to produce the much-needed oil; the operators, both independent and Standard Oil, placed all their resources without stint at the disposal of the Government.

PACIFIC COAST TELEPHONE DISPUTE.

The Pacific coast telephone dispute threatened to tie up the service in California, Oregon, Washington, Idaho, and Nevada, and in November, 1917, a strike actually became effective in Washington and Oregon. About 3,200 men who construct and keep up the plant and about 9,000 girl operators were involved in the dispute, which seemed to center about a demand on the part of the International

Brotherhood of Electrical Workers for recognition of the girls' union which had affiliated with them. "The men for the first time—being most favorably situated because of the demand for skilled electricians—made the recognition of the girls' union their controlling principle." The report states, however, that there were two other issues: A demand for an increase of wages and a demand for a closed shop, subsequently modified into a desire for a preferential shop. The men demanded a 25 per cent wage increase; the company offered a 12½ per cent increase. The closed-shop demand was used as a leverage in bargaining, but the preferential-shop idea was vigorously urged. These specific issues, it seems, were enveloped in an atmosphere of misunderstanding and suspicion, not only between the company and its employees but also between the northern and southern groups of employees. Moreover, a false issue of loyalty had been raised, particularly against the striking girls, which was vigorously repelled. Here, as the commission found was the case elsewhere, the attempt of parties on one side of an economic controversy to appropriate patriotism and stigmatize the other side with disloyalty served only to intensify the bitterness of the struggle and to weaken the force of unity in the country. What the commission was able to achieve in adjusting this dispute is set forth in the following excerpt from the report:

(a) The girls' locals were included in the trade agreement between the company and the brotherhood. In some other parts of the country the company had heretofore recognized the girls' union, and the plea that this made for inefficiency was the speculation of fear rather than the judgment of experience.

(b) Wage increases, obviously necessary, were provided for, leaving the extent of further increases to negotiation between the parties. In default of agreement, the issue was to be determined by an arbiter, to pass upon the complicated facts of a proper wage scale.

(c) The recognition of the girls' union, as well as the enforcement of all future grievances, was made effective by the establishment of impartial administrative machinery. United States administrators in the various districts were provided for the settlement of all issues which the parties themselves could not adjust.

(d) For the period of the War at least, in place of the resort to strike or lockout, there was thus established an effective peaceful process for the redress of grievances, secured by the authority of the United States Government.

(e) In effect there were involved a reversal of the labor policy of the company. New currents of cooperation were created. It takes some time, however, for such a change of policy to permeate through all the stages of an industrial hierarchy. Partly therefore, through this delayed adjustment to a new industrial régime on the part of local subordinate officials, partly by reason of obstructive suspicion of some of the radical labor leaders in the northern States, partly because of the limited facilities for labor administration on the part of the Government, considerable difficulty was experienced in the early days following the ratification of the commission's settlement. The commission was constantly appealed to. The quick exercise of administrative action by the commission and the new administrators, and a strict eye to the enforcement of the settlement in cooperation with the more conservative union leaders

and the higher officials of the company, succeeded in tiding over—by a process of flexible administration rather than adjudication—the obstructions and difficulties inevitable in such a situation. Before the commission left the coast signs of a new order of good relationship were already evident. Since then the representatives of the company and the brotherhoods have successfully negotiated a new wage scale without resort to arbitration.

UNREST IN THE LUMBER INDUSTRY OF THE PACIFIC NORTHWEST.

The lumber industry of the Pacific Northwest, employing about 70,000 men, suffered a breakdown of several months in the summer of 1917, "and is still in a state of seething unrest, woefully short of its productivity; for while the strike of 1917 was broken and the men went back beaten for the moment, the conflict was only postponed and not composed." The situation may be summed up in the following words of the report:

We are dealing with an industry still determined by pioneer conditions of life. Hardy contact with nature makes certain rigors of conditions inevitable, but the rigors of nature have been reinforced by the neglects of men. Social conditions have been allowed to grow up full of danger to the country. It is in these unhealthy social conditions that we find the explanations for the unrest long gathering force but now sharply brought to our attention by its disastrous effect upon war industries. The unlivable condition of many of the camps has long demanded attention. While large improvements in camp life have recently been made, many of the camps still require much betterment to make them fit human habitations. A number of employers have shown a most commendable understanding of the implications of operating camps unfit for men. Unfortunately, however, the old abuses were so long continued and so widespread, that even after physical conditions are bettered a sense of grievance remains. This discontent gradually translated itself into demands not merely for physical comforts but for certain spiritual satisfactions.

Partly the rough pioneer character of the industry, but largely the failure to create a healthy social environment, has resulted in the migratory, drifting character of workers. Ninety per cent of those in the camps are described by one of the wisest students of the problem, not too inaccurately, as "womanless, voteless, and jobless." The fact is that about 90 per cent of them are unmarried. Their work is most intermittent, the annual labor turnover reaching the extraordinary figure of over 600 per cent. There has been a failure to make of these camps communities. It is not to be wondered, then, that in too many of these workers the instinct of workmanship is impaired. They are—or, rather, have been made—disintegrating forces in society.

It was found that efforts had been made to rectify evils through the trade-union movement, but these seem to have failed because of the small headway trade-unions are able to make, due largely "to the bitter attitude of the operators toward any organization among their employees," an attitude which "has reaped for them an organization of destructive rather than constructive radicalism." The focusing point of the unrest was a demand for the 8-hour day, the lumbering industry being almost the only large industry on the coast in which the basic 8-hour day does not prevail. "Opposition to the 8-hour day is carried to the point of binding members of an employers' association on the Pacific coast by agreement to discriminate against

such mills as introduce the change." The efforts of the commission to establish an 8-hour day in the lumber industry were not entirely successful.

In the judgment of the commission the introduction of the basic 8-hour day in the Pacific Northwest lumber industry is indispensable as a measure of national need. It is essential in order to assure stability in the industry, efficiency of output, and to obtain an adequate labor supply in the face of better competitive conditions in neighboring industries. Negotiations between the commission and the operators' association on the coast had reached a point where the adoption of the 8-hour day seemed practically assured. Unfortunately, conferences between representatives of the Pacific coast lumbermen and officials in Washington, held contemporaneously with the session of the commission in Seattle, gave rise to advices from such representatives to their associates on the coast which led to a reversal of attitude and to insistence that the 8-hour day must go into operation for the entire country before the Northwest Pacific coast would yield. The principal and certain source of difficulty, therefore, remains. It can be and should be promptly removed by administrative action requiring the basic 8-hour day in all contracts for lumber entering into Government work.

Some means of contact between operators and employees as a body is likewise essential. If it is too abrupt a step in the evolutionary process of this industry to deal collectively with trade-unions, some method of representation of the workers collectively in determining the general conditions under which they work and for securing rectification of evils should be devised.

PACKING INDUSTRY DISPUTE.

Of very great importance in the prosecution of the War is the meat-packing industry centering in Chicago. Because of this fact the threatened strike in December, 1917, affecting upward of 100,000 men, directed the attention of the commission to an adjustment of the differences involved. In that industry, according to the report of the commission, the packers have long opposed the organization of their workingmen, and the union, which had been destroyed by the strike of 1903, had not been able, up to 1917, to rehabilitate itself. In 1917, however, effective organization again made itself felt, and by the end of the year from 25 to 50 per cent of the men were unionized. An effort was made to induce the packers to recognize the union, at least to the extent of meeting its representatives and talking matters over. This the packers refused to do. The specific grievances in the controversy, which threatened to result in a strike, were low wages and long hours. The men asked for an 8-hour day in place of a 10-hour day. The companies conceded the principle of the 8-hour day, but claimed to be obstructed in its adoption by reason of difficulties attending both inbound and outbound shipments, conditions which "depend for correction upon action both by the Government and the industry." The commission's settlement proceeded along the general lines it had taken in other industries:

(a) The principle of adjustment through negotiation and arbitration was established to take the place of strike and lockout during the period of the War.

(b) Prohibition of discrimination for union affiliation is rendered effective by its enforcement through administrative machinery. It is not sufficient to recognize in the abstract the right of workmen to organize. Therefore, effective means were provided to secure to the union the right to live and to grow.

(c) The unfairness of compelling workmen to deal individually with employers of large-scale industries, particularly emphasized in the case of non-English speaking workmen, is recognized in practice by allowing workmen to voice their claims through representatives.

(d) The specific demands of the workers as to changes in hours, wages, and conditions of employment were all left for determination by the United States administrator.

Here, as elsewhere, a tense situation threatening breakdown of a vital war industry was relieved by establishing machinery for adjustment. Under this machinery the parties are now proceeding to work out their difficulties. The hope is entertained that not only will specific grievances be justly dealt with but healthier permanent relationships will be created in the very process of seeking to reach adjustments.

CAUSES OF LABOR DIFFICULTIES.

While each industry presents its own peculiarities, certain underlying general factors applicable to all industries were found by the commission, during the three months' investigation, to be the cause of labor difficulties. The effective conduct of the War, declares the commission, suffers needlessly because of (1) interruption of work due to actual or threatened strikes, (2) purposed decrease in efficiency through the "strike on the job," (3) decrease in efficiency due to labor unrest, and (4) dislocation of the labor supply. Among the causes of unrest the following are given as being especially significant of the industrial needs of the War:

(a) Broadly speaking, American industry lacks a healthy basis of relationship between management and men. At bottom this is due to the insistence by employers upon individual dealings with their men. Direct dealings with employees' organizations is still the minority rule in the United States. In the majority of instances there is no joint dealing, and in too many instances employers are in active opposition to labor organizations. This failure to equalize the parties in adjustments of inevitable industrial contests is the central cause of our difficulties. There is a commendable spirit throughout the country to correct specific evils. The leaders in industry must go further, they must help to correct the state of mind on the part of labor; they must aim for the release of normal feelings by enabling labor to take its place as a cooperator in the industrial enterprise. In a word, a conscious attempt must be made to generate a new spirit in industry.

(b) Too many labor disturbances are due to the absence of disinterested processes to which resort may be had for peaceful settlement. Force becomes too ready an outlet. We need continuous administrative machinery by which grievances inevitable in industry may be easily and quickly disposed of and not allowed to reach the pressure of explosion.

(c) There is a widespread lack of knowledge on the part of capital as to labor's feelings and needs and on the part of labor as to problems of management. This is due primarily to a lack of collective negotiation as the normal process of industry. In addition there is but little realization on the part of industry that the so-called "labor problem" demands not only occasional attention but continuous and systematic responsibility, as much so as the technical or financial aspects of industry.

(d) Certain specific grievances, when long uncorrected, not only mean definite hardships; they serve as symbols of the attitude of employers and thus affect the underlying spirit. Hours and wages are, of course, mostly in issue. On the whole, wage increases are asked for mostly in order to meet the increased cost of living, and such demands should be met in the light of their economic causes. Again, the demand for the 8-hour day is nation-wide, for the workers regard it as expressive of an accepted national policy.

RECOMMENDATIONS.

In conclusion, the President's mediation commission submits the following recommendations:

1. The elimination to the utmost practical extent of all profiteering during the period of the war is a prerequisite to the best morale in industry.

2. Modern large-scale industry has effectually destroyed the personal relation between employer and employee—the knowledge and cooperation that come from personal contact. It is therefore no longer possible to conduct industry by dealing with employees as individuals. Some form of collective relationship between management and men is indispensable. The recognition of this principle by the Government should form an accepted part of the labor policy of the Nation.

3. Law, in business as elsewhere, depends for its vitality upon steady enforcement. Instead of waiting for adjustment after grievances come to the surface there is needed the establishment of continuous administrative machinery for the orderly disposition of industrial issues and the avoidance of an atmosphere of contention and the waste of disturbances.

4. The 8-hour day is an established policy of the country; experience has proved justification of the principle also in war times. Provision must of course be made for longer hours in case of emergencies. Labor will readily meet this requirement if its misuse is guarded against by appropriate overtime payments.

5. Unified direction of the labor administration of the United States for the period of the War should be established. At present there is an unrelated number of separate committees, boards, agencies, and departments having fragmentary and conflicting jurisdiction over the labor problems raised by the War. A single-headed administration is needed, with full power to determine and establish the necessary administrative structure.¹

6. When assured of sound labor conditions and effective means for the just redress of grievances that may arise, labor in its turn should surrender all practices which tend to restrict maximum efficiency.

7. Uncorrected evils are the greatest provocative to extremist propaganda, and their correction in itself would be the best counterpropaganda. But there is need for more affirmative education. There has been too little publicity of an educative sort in regard to labor's relation to the War. The purposes of the Government and the methods by which it is pursuing them should be brought home to the fuller understanding of labor. Labor has most at stake in this War, and it will eagerly devote its all if only it be treated with confidence and understanding, subject neither to indulgence nor neglect, but dealt with as a part of the citizenship of the State.

¹ Since this report was written, the direction of the labor administration for the War has been delegated to the Secretary of Labor.

TRADE AGREEMENTS IN THE WOMEN'S CLOTHING INDUSTRIES OF CINCINNATI AND ST. LOUIS.¹

BY BORIS EMMET, PH. D.

Prior to 1916 the extent of collective bargaining in the women's wear industries of Cincinnati and St. Louis was negligible. The achievements of the Cincinnati garment workers' unions in the form of effective trade agreements were insignificant. A similar situation prevailed in the women's clothing industries of St. Louis, where, in spite of the activity of labor organizations, no successful collective bargaining was taking place.

The causes responsible for the failure of the Cincinnati and St. Louis garment workers' organizations to achieve their objects need not be commented upon at great length. In both of these cities only a very small part of the workers in the trade were organized. Unrestricted immigration flooded the local labor markets, as it did the garment trades of New York, Philadelphia, and Chicago, and caused a severe competition for positions. This competition for jobs made effective organization impossible. The correctness of this statement is confirmed by the present management of the garment workers' unions of both cities and by many employers, all of the informants pointing emphatically to unrestricted immigration "as the principal cause for the prolonged lack of effective organization on the part of the workers."

The great diminution in the amount of immigration which came as a result of the European War appears to have had a salutary effect upon the existing labor organization. The decrease in the vast and steady inflow of potential competitors for positions contributed greatly to the stabilization of the garment workers' unions. A curtailed supply of labor increased the bargaining power of workers already in the trade, but particularly of those, who, through unionization, could take immediate advantage of the new situation. So great, however, was the prewar labor supply in the garment trades of these cities that it took more than a year to exhaust it. Not until the busy season of the fall of 1915 were the effects of a diminished labor supply felt.

The shortage of labor due to the sudden curtailment of immigration was further intensified with the entry of the United States into

¹ This article is a preliminary summary of one of the phases of a study of trade agreements to be published by the bureau. Similar articles dealing with trade agreements in the women's wear industries of New York City, Philadelphia, and Chicago appeared, respectively, in the December, 1917, and January and February, 1918, issues of the MONTHLY REVIEW.

the war, which immediately resulted in a demand for vast amounts of war clothing, and in additional need, therefore, for the services of needle-trade hands in the men's clothing industries which received the war contracts. The intensified demand for such workers in the men's clothing trades drew many of the women's garment workers from their old positions to the more remunerative and steady employment offered by the war-clothing establishments.

A diminished supply of labor, coupled with a greatly intensified demand for it, was, no doubt, responsible for the establishment of effective collective bargaining on a large scale in the women's ready-to-wear clothing industries of Cincinnati, as well as for the appearance, for the first time, of a relatively strong garment workers' union in the city of St. Louis. As will be shown, the influence of this organization is just beginning to make itself felt.

CINCINNATI.

The total number of workers employed at the present time in all of the garment industries of Cincinnati is estimated to be close to 1,600. Of this number about 1,200 are engaged in the manufacture of cloaks, suits, and skirts, the remaining 400 being employed in a dozen establishments which specialize in the making of house dresses, kimonos, and white goods or women's underwear. As regards unionization, various conditions exist in the different industries mentioned. No unionism to speak of exists in the house-dress, kimono, or white-goods industries. A different situation, however, is to be found in the cloak and suit industry, the principal women's wear industry of the city. More than two-thirds of the cloak and suit makers of Cincinnati are members of unions and work at the present time under union conditions, as described elsewhere in this article.

The cloak makers of Cincinnati are organized as locals 30, 63, and 98 of the International Ladies' Garment Workers' Union. These three locals are connected by means of a joint committee known as the Joint Board of Cloak and Skirt Makers' Unions of Cincinnati, which is made up of delegations from each of the local unions. It is in the name of this board and with its sanction that all trade agreements with employers are entered into.

On February 7, 1916, a general strike was declared in the cloak and suit industry of Cincinnati for the purpose of forcing union recognition and collective bargaining.

The strike proved effective and achieved its purposes. As a result of it, 15 agreements were signed with as many firms. Each of the agreements is to run for one year from the date of signing and provides for the following: (1) The employer agrees to hire none but members of the union to perform all the cutting, sewing, pressing, finishing,

and busheling; (2) there is to be at all times in the shop of the employer a shop chairman, selected by the employees to represent them in their dealings with the employer; (3) duly authorized union officials are to be allowed to visit the factory for the purpose of investigating existing conditions regarding safety, sanitation, and ventilation as well as to ascertain if the provisions of the agreement are complied with; (4) all cutters, trimmers, sample and duplicate makers, bushelmen, and skirt underpressers are to work by the week and at the following minimum weekly rates of wages: Full-fledged cutters, \$26; trimmers, \$20; sample and duplicate operators, \$26; sample and duplicate finishers, \$16; bushelmen, \$22; skirt underpressers, \$18; (5) an increase of \$2 per week above the scale of February 7, 1916, to all week workers other than those specified in the preceding provision; (6) employees engaged in branches of the trade not enumerated above are to be paid by the piece; (7) piece rates are to be determined on a basis which will yield to a jacket operator 75 cents per hour, to a skirt operator 60 cents, to an upper presser 60 cents, and to a finisher 50 cents per hour; (8) all piece rates are to be determined collectively by the employer and a piece-price committee freely selected by the employees, and employees are not to be required to work on garments before a mutually satisfactory price has been established; (9) if, upon investigation, it should be established that piece prices have been settled below the hourly base rates specified above, such prices are to be resettled; (10) a week's work is to consist of 48 hours, distributed over six working days; (11) overtime work is to be limited to six hours per week, and permissible only during the busy seasons of the year; (12) time and a half for overtime work to week workers; (13) four legal holidays, with pay, to week workers; (14) equal distribution of work among all workers; (15) no employee to be discharged without good cause after an initial trial period of two weeks, with the further proviso that workers wrongfully discharged or laid off are to be entitled to full pay for the time lost; (16) any dispute between the firm and its employees which can not be adjusted by the shop chairman or union representative is to be submitted to arbitration.

As mentioned, the organized two-thirds of the cloak and suit makers of Cincinnati work under the conditions just enumerated. The unorganized workers of the trade are employed in four establishments, which, although having no understanding with the union, and still clinging, nominally at least, to individual bargaining methods, maintain very similar conditions of hours and wages. It is the opinion of the employers who deal collectively with their employees that the rates of pay and general conditions of work in the Cincinnati cloak and suit trade have been thoroughly equalized and that the few non-

union shops actually maintain union standards. The existence of such a situation is attributable to the fact that the relative scarcity of workers which some time ago began to be felt during the busy seasons, has made the existing trade-unions powerful. Employers incurring the active enmity of the garment workers' organization find themselves unable to secure the needed help during the busy seasons of the year. Instances are actually known of employers who had to give up their business on account of lack of help, due chiefly to their unwillingness to maintain union standards.

The agreements in operation at the present time in the cloak and suit industry are working satisfactorily. Grievances which arise are peacefully and quickly adjusted by the parties themselves without recourse to the assistance of outside arbitrators or umpires provided for by the agreement in cases upon the disposition of which the parties themselves can reach no satisfactory settlement.

In addition to the 19 cloak and suit houses referred to there are to be found in the city of Cincinnati about a dozen firms which specialize in the manufacture of house dresses, kimonos, and women's underwear. These establishments employ about 400 workers—mostly unskilled immigrant girls, with little or no aptitude for organization. It is said on reliable authority that the labor conditions prevailing at the present time in the house-dress, kimono, and white-goods establishments are oppressive and rates of wages low. An effort was made some time ago to organize these trades, but with little success. One firm, employing about 40 hands, agreed to introduce and maintain union conditions of work and pay, but refused to recognize the union. This firm granted to its employees the following concessions: (1) A 48-hour week; (2) time and one-half for overtime work; (3) a 15 per cent increase in wage rates; (4) a minimum weekly wage of \$7 for beginners; (5) a promise that in the future all piece rates would be made in consultation with a price committee selected by the employees.

The specified conditions are interesting because of the fact that the joint board of cloak makers' unions, which is temporarily in charge of the situation, intends to make similar demands upon the other employers of the trade, and has a good chance to win the desired concessions. A definite demand for union recognition will, it is said, supplement the other demands to be made.

ST. LOUIS.

Within the boundaries of the city of St. Louis are located about 35 establishments engaged in the manufacture of women's ready-to-wear clothing. The manufacturing activity of these establishments is confined principally to the making of cloaks, suits, skirts, and, in a

very few instances, dresses. Very few waists, house dresses, and kimonos and almost no white goods are made in St. Louis.

The total number of women's garment workers in the city is estimated to be slightly over 1,500, one-eighth of which, or about 200, are organized as Local 15 (skirt, waist, and dress makers' union) of the International Ladies' Garment Workers' Union. This union has at the present time seven trade agreements with as many firms. The number of workers covered by these agreements is about 150. The number of workers affiliated with the union is, however, somewhat larger, as a considerable number of union garment makers are employed by firms which have no trade agreements with their employees.

The existing trade agreements are uniform in their provisions, each specifying the following conditions: (1) Employment of none but union members as long as the union is willing and ready to furnish all the needed help; (2) the presence in each establishment of a shop chairman and piece-rate committee;¹ (3) limitation of extent of overtime, such overtime to be confined to three evenings per week—Tuesday, Wednesday, and Thursday—between 5.30 and 8 o'clock, and only during the busy seasons of the year; (4) payment to week workers for certain legal holidays; (5) equal distribution of work among the workers; (6) peaceful adjustment of all grievances by the parties themselves, and in cases upon the disposition of which no satisfactory agreement can be reached, by a mutually agreeable third and outside person, or umpire, whose decision in the matter is to be final and binding upon both sides.

The number of women's garment making establishments in St. Louis which deal collectively with their employees is not sufficiently large to exercise any definite influence in determining the conditions of labor for the industry at large, the major part of which, as already stated, is still on an individual bargaining basis. This form of bargaining does not appear to work in the interests of the workers. It is stated on reliable authority that the conditions of labor, and particularly of pay, in existence at the present time in the major part of the industry, are considerably below those specified in the agreements described above. The remedy for this condition lies, apparently, in the establishment of some form of collective bargaining.

General industrial conditions in the garment trades of St. Louis at the present time seem to be very favorable for establishing effective collective bargaining. The local supply of women's garment makers

¹ The shop chairman is the official representative of the union on the premises of the firm, in charge of guarding the interests of the employees. He is in constant touch with his fellow workers, gives advice when needed, hears employees' complaints, and confers with the firm for the purpose of adjusting grievances. The piece-rate committee is in charge of rate making, being called into consultation by the employer whenever piece rates are to be set, it being understood that no rate is to become effective unless approved by the committee.

has been greatly diminished by the cessation of European immigration and by the entry of the United States into the war, which drew many women's garment workers to war clothing factories where wages were better and employment steadier. This movement of women's garment makers has greatly strengthened the strategic position of the organized minority of the workers in the trade. The union is at the present time contemplating the launching of a campaign for a complete unionization of the industry. Uniform demands are to be made upon all of the women's garment manufacturers of the city. Although not as yet finally formulated, these demands will embrace the following: (1) Union recognition and collective bargaining; (2) minimum weekly rates of wages as follows: For cloak cutters, \$28.50; for skirt cutters, \$25; for trimming cutters, \$20; (3) equal distribution of work among the workers; (4) 48-hour week; (5) limitation of overtime, such overtime to be permitted only during the very busy seasons of the year; (6) time and one-half for overtime work; (7) pay to week workers for certain legal holidays; (8) peaceful adjustment of all grievances, with the further provision that cases upon the disposition of which the parties themselves are unable to agree are to be submitted for adjustment to a mutually satisfactory outside party, or umpire, whose decision is to be considered as binding upon both sides; (9) in exchange for a promise of the employer not to lock out his help, the union is to refrain from calling strikes pending the peaceful adjustment of grievances by the agencies created for that purpose.

LABOR AND THE WAR.

ADJUSTMENT OF SHIPBUILDING DISPUTES ON THE PACIFIC COAST.

On August 20, 1917, an agreement was entered into by Government officials and labor chiefs, the object of which was that disputes concerning wages, hours, or conditions of labor in the construction of shipbuilding plants or of ships might be speedily and satisfactorily adjusted without interruption of production necessary to the national defense.

This agreement, which was reproduced in the October, 1917, number of the MONTHLY REVIEW (p. 27), provided for an adjustment board of three persons "to be appointed by the United States Shipping Board Emergency Fleet Corporation, one to represent the said corporation, one to represent the public and to be nominated by the President of the United States, and one to represent labor, the last to be nominated by Samuel Gompers." As constituted, the board consisted of V. Everit Macy, of New York, chairman; A. J. Berres, of Washington, secretary-treasurer of the metal trades department of the American Federation of Labor; and E. F. Carry, of Chicago, president of the Haskell-Barker Car Co., representing, respectively, the public, labor, and the Emergency Fleet Corporation. After serving for a time Mr. Carry, representing the Emergency Fleet Corporation, resigned and was succeeded by Mr. Louis A. Coolidge.

On November 4, 1917, the adjustment board announced its decision as to disputes in shipyards of San Francisco Bay, Columbia River, and Puget Sound districts. This decision, which took effect November 12, 1917, is as follows:

DECISION OF SHIPBUILDING LABOR ADJUSTMENT BOARD TOUCHING DISPUTES IN SHIPYARDS OF SAN FRANCISCO BAY AND COLUMBIA RIVER AND PUGET SOUND DISTRICTS.

I. Origin and purpose of board.—The Shipbuilding Labor Adjustment Board is a war board. Its supreme object is to hasten the carrying out of the shipbuilding program of the Government. Employers and employees in the shipbuilding industry are enlisted in their country's service just as truly as the soldiers at the front. With all possible earnestness we wish to impress upon them their obligation to merge their individual interests in the common purpose of supplying the ships which the country requires. With their help we shall win the war. Without their loyal cooperation our democratic institutions will go down to merited defeat.

II. Obligation of employers and employees to cooperate.—The owners of the shipyards are, during the duration of the war, merely the agents of the Government. Practically the whole shipbuilding industry of the country is being carried on for the benefit of the Government. Employers and employees in the shipyards must realize that the war has changed their relation to each other. They are now working together for the preservation of their common country.

The Government is insistent that the ships it requires must be built and built promptly. It is equally insistent that standards of living must be preserved. Employees may thus join with hearty accord in the efforts of employers to carry out the shipbuilding program and rely on the good faith of the Government and of this board to see to it that any grievance that they may have is promptly considered and fairly adjusted.

III. *Rapid expansion of shipbuilding industry called for.*—The national program requires an increase in the output of ships from the 750,000 tons turned out in 1916 to 6,000,000 tons in 1918. This necessitates the introduction, wherever possible, of the two and even three shift systems. Immediate steps to bring about this change must be taken by shipyard owners. It will involve not only the enlargement of the labor force, but provision of adequate lighting facilities and safety devices to protect employees from the special hazards connected with nightwork.

At a rough estimate the shipyards of the Pacific coast already employ 50,000 men. To meet the pressing needs of the Government at least 75,000 more men must be employed. This will mean a demand for at least 30,000 skilled mechanics in addition to those already employed, a demand that can only be satisfied by drawing mechanics to the shipyards from less essential industries and by training men who have not yet the required skill.

Realization of these conditions is causing the Government to concern itself seriously with the problem of redistributing and increasing the available supply of skilled workers. In San Francisco and Seattle and to a less extent in Portland, employers look to the trade-unions to supply additional workers in the different crafts as they are required. The evidence presented to us indicates that some of the unions are already unable to meet demands on them. In view of the certainty of a greatly increased demand, the board urges upon the Department of Labor the extension of the Federal Employment Service in California, Oregon, and Washington to serve as a supplement to the trade-unions when they are unable themselves to supply skilled craftsmen. The board also urges that representatives of organized labor and the employers concerned work out, in cooperation with agents of the Government, plans for the more rapid training of skilled workers in the different crafts.

IV. *Discrimination against unfair material.*—Whatever reasons may be urged in defense of discrimination against so-called "unfair" material in time of peace, to permit such discrimination to interfere with the defense of the Nation in time of war would be intolerable. We trust to the good sense and patriotism of the employees to refrain from such practices when opposed to the interests of the Government.

V. *Factors considered in determining wages.*—In arriving at a fair wage scale we have had two ends in view—equalizing wage rates in the three shipbuilding centers and adjusting wages to the higher cost of living resulting from the war.

The enticing of workers from one plant to another and from one city to another has had a demoralizing effect on the production of ships. The establishment of a uniform wage scale for the San Francisco, Columbia River, and Puget Sound districts will have a steadying influence. Therefore, since the cost of living in these districts is substantially the same, we have decided upon a uniform scale for all of them.

In order to preserve the standards of living in existence before the war we took as a basis the rates on which employers and employees had united as shown by the agreements in effect June 1, 1916. To determine the increase in the cost of living from that time until October 1, we made use not only of the evidence presented at our hearings in the three cities but also of all other available material and investigations, including Federal, State, and municipal reports. The wages fixed represent the wages current in the three cities, increased to conform to the ascertained increase in the cost of living.

We believe that public opinion approves the intention of the Government to protect, so far as may be possible, American standards of living. On the other hand

we do not believe that advantage should be taken of the national emergency to increase wages beyond a point corresponding to the increased cost of living. Attracting workers to the shipbuilding industries of the Pacific coast by establishing higher wages than are justified by the expense of living would, we believe, instead of improving the national labor situation, cause even greater disorganization than already exists. As a national board we feel bound to view our task nationally and arrive at decisions that will tend to increase the production of ships and other essential commodities, not merely in one locality but in the whole country.

Cooperation of employers and employees will be counted upon to adjust in proportion to the scale hereby fixed all differences, if any, which now exist or which may hereafter arise with respect to wages of employees not specifically named in the attached schedule. In any event it must be borne in mind that any such differences not covered by this report and decision are subject to prompt adjustment through the medium of the examiner of each district.

VI. *Decision of board as to issues in dispute.*—Our decision in regard to the issues presented to us is as follows:

First. The minimum rates of wages to be paid the different classes of employees in the shipyards covered by this decision shall be as set forth in the schedule appended hereto (Exhibit A), which is made a substantive part of this award.

Second. These rates are to be retroactive for employees in the shipyards of San Francisco Bay district from September 22, for those in the shipyards of the Columbia River district from September 5, and for those in the yards of the Puget Sound district from August 1.

Third. The shipyard owners shall pay to employees who were employed by them during the interval from the dates specified above for the respective districts and the dates when the new rates fixed by this award are put into effect, back pay for all the time they worked in such interval equal to the difference between their wages calculated at the new rates and the wages they actually received, such back pay to be paid within two weeks after this decision is to take effect.

Fourth. Rates of wages now being paid in excess of the minimum rates fixed are in no wise altered or affected by the establishment of these rates.

Fifth. The working conditions in the shipyards of the San Francisco Bay district shall be those agreed to by the representatives of employers and employees in said district as appended hereto (Exhibit B), which agreement is made a substantive part of this award.

Sixth. The working conditions in the shipyards of the Columbia River district shall be those heretofore established by the parties according to the terms of Exhibit C hereto appended, which is made a substantive part hereof and all existing craft conditions not changed by same Exhibit C shall remain unchanged unless modified by agreement of the parties approved by this board; provided that double time shall be paid for work on holidays and on Saturday afternoons in June, July, and August, and that rate of payment for work in excess of eight hours a day shall be fixed by mutual agreement or, failing agreement, by the examiner for the Columbia River district.

Seventh. The working conditions in the shipyards of the Puget Sound district shall be determined by collective agreement of the employers and employees in the shipyards of said district, subject to the approval of the board.

Eighth. This decision shall apply to all shipyards of the San Francisco Bay, Columbia River, and Puget Sound districts which were involved in disputes with their employees during September or October, 1917.

Ninth. In accordance with the understanding reached by all parties throughout the coast district, no change shall be made in any existing craft conditions nor shall any new craft conditions be established until the same shall have been agreed upon between employer and employee, subject to the approval of this board.

Tenth. This decision shall be put into effect on or before Monday, November 12, 1917.

VII. *Spirit of good will by both sides.*—In conclusion we wish to record our appreciation of the cooperation spirit displayed by both employers and employees as shown by the action of the employees in all three cities in returning to work while awaiting our decision.

We wish to express our special indebtedness for valuable assistance and advice to Mr. Gavin McNab, of San Francisco; to Mr. James A. Franklin, president International Brotherhood of Boiler Makers, Iron Shipbuilders and Helpers of America; to Mr. James Wilson, president Pattern Makers' League of North America; to Mr. William H. Johnston, president International Association of Machinists; Mr. Milton Snellings, president International Union of Steam and Operating Engineers; and Mr. James V. Ryan, organizer, Amalgamated Sheet Metal Workers, International Alliance.

The memorandum to which this board owes its existence provides for the selection of an examiner in each district to act for the board in the settlement of disputes which can not be settled by the employees and employers immediately concerned, or by the district officer of the Emergency Fleet Corporation. Appeal from the decision of the examiner may be taken by either side to the board.

We hereby appoint, as examiner of the Puget Sound district, ex-Gov. Henry McBride of Seattle, and as examiner of the Columbia River district, Mr. Richard W. Montague of Portland.

V. EVERIT MACY, *Chairman.*

LOUIS A. COOLIDGE.

(Approved except as to wage scale.)

To these rates 10 per cent increase was added for all men who work for six consecutive days in any week, a total of not less than 48 hours, by order of Fleet Corporation on December 10, effective on and after December 15.¹

EXHIBIT "B."

Agreement as to working conditions in San Francisco district.

First. That each party to this agreement agrees and consents to the following rules and regulations which shall govern the mutual relations of the parties herein mentioned.

Second. Eight hours shall constitute a day's work and be worked between the hours of 8 a. m. and 5 p. m., provided, however, that this shall not interfere with the introduction of shifts, also that certain objections applying to the starting and quitting time in some of the trades be removed by the Iron Trades Council. Saturday half holiday for the months of June, July, and August will be in effect 1918.

Third. All time worked over the regular eight-hour day shall be paid for at the rate of time and one-half for the first three hours, after which double time shall be paid, excepting that after February 1 double time shall be paid for all overtime. Double time shall be paid for Sundays and the following holidays: New Year's Day, Washington's Birthday, Memorial Day, July Fourth, Labor Day, Admission Day, Thanksgiving Day, Christmas Day, and on election days for governor and President

¹ This bonus was made a regular wage increase for all trades in this Exhibit. See pp. 73 and 74.

only. An additional 5 per cent shall be added to the daily rate of all men working night shifts.

Fourth. Under no circumstances shall any work be performed on Labor Day except to preserve life or property.

Fifth. Such grievances as do not relate to the subject of hours or wages covered by this agreement which may arise in any shop shall be given consideration as follows: Upon complaint being made by either party to this agreement in writing, the duly authorized representative of the firm and the business representative of the union, or the representative of the Iron Trades Council who may be elected to represent the union, shall immediately proceed to the shop or shops where such grievances exist and endeavor to mutually settle the same.

Sixth. Any grievance that can not be settled in this manner must be referred to conference, the call and subject for such conference to be made in writing. This conference shall be called within six days from receipt of notice for the purpose of adjusting the question at issue, and the conference shall continue day after day until the question at issue is settled, unless mutually postponed.

Sixth (a). Any disputes which can not be settled by means provided herein shall be referred to the examiner appointed by the Labor Adjustment Board as provided in the memorandum of August 20, 1917, and which is attached hereto and made a part of this agreement.

Seventh. No change shall be made in existing conditions nor any new conditions established by any party to this agreement until the same has been agreed upon in conference. And these conditions shall always be construed so as to promote to the fullest extent the policy of the Government during the period of national need.

Eighth. Employees shall be paid on some regular and definite day of each week, and in no case shall more than a week's pay be held back.

Ninth. During the life of this agreement there shall be no strike on the part of the employees nor lockout on the part of the employers.

Tenth. Any employee laid off, discharged, or quitting of his own volition shall receive all wages due him within 24 hours of the termination of his employment, excepting Sundays and holidays.

Eleventh. Business representatives of the different crafts shall be given access to the shops or yards at the discretion of the management.

Twelfth. This agreement shall be in full force and effect for a period of 12 months from date of signing thereof. Ten months after the signing of this agreement a conference shall be held for the purpose of the consideration of a continuation of the agreement or formation of a new one. This conference committee shall consist of not more than three members from the California Metal Trades Association and the California Foundrymen's Association jointly, and not more than three members from the Iron Trades Council, and the conference shall be held in continuous session and shall proceed until an agreement or deadlock is reached. Nothing in this paragraph shall be construed as superseding in any manner the provisions of the memorandum of August 20, 1917, referred to in paragraph 6 (a).

EXHIBIT "C."

Agreement as to working conditions in the Columbia River district.

First. Eight hours shall constitute a day's work.

Second. All time worked over the regular eight-hour day shall be paid for at rate or rates to be established by the Shipbuilding Labor Adjustment Board, including holidays: New Year's Day, Washington's Birthday, Decoration Day, July Fourth, Labor Day, Thanksgiving Day, Christmas Day, and general election days.

Third. The employees in each craft or calling in a shop or yard shall have the right to select three of their number to represent them as members of a shop committee.

Each member of this committee shall be chosen by majority vote through secret ballot in such manner as the employees shall direct. The chairman of each craft committee shall be a member of the joint shop committee.

Fourth. When a grievance arises it shall be taken up by the committee, first with the foreman, second with the superintendent. In the event the question has not been adjusted the committee shall then take the matter up with the president of the company. If the matter can not be adjusted between the shop committee and the president, the shop committee shall have the right to call into conference with the president a representative chosen by the committee. In case the president fails to adjust the matter satisfactorily it shall be submitted to the examiner to be appointed by the Shipbuilding Labor Adjustment Board as provided in memorandum of August 20, 1917, which is attached hereto and made a part hereof.

Fifth. Employees shall be paid every Saturday at time of quitting work, and in no case shall more than three days' pay be held back. This practice to be put in effect as soon as practicable.

Sixth. Any employee being laid off, discharged, or quitting of his own volition shall within 24 hours receive all wages due him.

Seventh. A trained nurse shall be in attendance to render first aid at all times whenever men are working.

Eighth. So far as practicable and when men are available, all labor in connection with construction work and repairs shall be done by employees in the trade or calling generally recognized as having jurisdiction therein.

Ninth. All questions relating to basic wage scale and overtime shall be left to the determination of the Shipbuilding Labor Adjustment Board, such determination of wages to be retroactive as said board shall direct.

Tenth. Any committeeman appointed hereunder who shall be found to have been discharged without just and sufficient cause after due investigation in the manner herein provided for the adjustment of grievances shall be reinstated with full pay for all time lost.

Eleventh. The question of employing apprentices shall be taken up for adjustment in the manner provided herein for the adjustment of grievances.

Twelfth. In view of the fact that the existing strike was called on account of differences which have now been adjusted, no discrimination shall be practiced in the reemployment of the former employees.

Thirteenth. It is understood and agreed that any concessions of recognized principles by either party to this agreement shall be without prejudice for the sole purpose of assisting the Government in the successful prosecution of the war, but that this agreement shall continue during the period of the war.

On December 8, 1917, the Navy Department and the United States Shipping Board Emergency Fleet Corporation issued two important labor documents. The first relates to a further adjustment of wages and hours of employees in shipyards of the Pacific coast, and is as follows:

STATEMENT SUBMITTED BY THE NAVY DEPARTMENT AND THE
UNITED STATES SHIPPING BOARD EMERGENCY FLEET CORPORATION.¹

In order to provide a proper stimulus to increase the output in the shipyards of the Pacific coast, and in order to encourage men who live at great distances to leave their homes and enter on service in the shipyards, the United States Shipping Board

¹ American Federationist, January, 1918, p. 49.

Emergency Fleet Corporation will pay to all employees of shipyards on the Pacific coast, with the exception of those working under the Seattle agreement, a war-service payment of 10 per cent, effective on and after December 15, 1917, to all men who work for 6 consecutive days in any week a total of not less than 48 hours, provided that men prevented from working on account of the elements, physical condition, or any unavoidable cause will not be denied the benefits provided for under this statement, the payment to be computed on straight time at the minimum rate provided in the award; and on February 1, 1918, a further stimulus to attract men to the shipbuilding industry will be provided by converting the above to a permanent increase of 10 per cent of the adjustment-board rates, provided that nothing in this memorandum shall prevent a rehearing of this matter by the wage adjustment board. It is stipulated that for the purpose of such rehearing the award of the adjustment board shall be considered as expiring at all Pacific coast plants six months from the date at which the award became effective in the Puget Sound district—that is, February 1, 1918.

December 8, 1917.

J. A. FRANKLIN.
JAS. O'CONNELL.
JOHN I. NOLAN.

The second of these statements is a new agreement entered into by the Metal Trades Department of the American Federation of Labor, the Emergency Fleet Corporation, and the Navy Department. This agreement, which is reproduced below, supersedes the agreement of August 20, 1917.

MEMORANDUM FOR THE ADJUSTMENT OF WAGES, HOURS, AND CONDITIONS OF LABOR IN SHIPBUILDING PLANTS.¹

When disputes arise concerning wages, hours, and conditions of labor in the construction or repair of shipbuilding plants, or of ships in shipyards, under the United States Shipping Board Emergency Fleet Corporation, or under said shipping board, or under contract with said corporation, or with said board; or if questions coming under the jurisdiction of the board arise with reference to such construction in a private plant in which construction is also being carried on for the Navy Department, and attempts at mediation or conciliation between employers and employees have failed, the adjustment of such disputes shall be referred to an adjustment board of three persons, hereinafter called the "board," one to be appointed jointly by the said corporation and the Navy Department, one to represent the public and to be appointed by the President of the United States, and one to represent labor, to be appointed by Samuel Gompers, president of the American Federation of Labor. It is understood, however, that this memorandum shall in no wise serve as a precedent for procedure in Government plants under the War or Navy Departments, except as may be authorized by such departments.

The plant where such construction is being carried on shall be geographically districted by the board. In each district the contractors in whose plants such construction is being carried on, and the representatives of such international labor organizations as have members engaged in such production or construction in such

¹ American Federationist, January, 1918, p. 50.

plants and as are selected for the purpose by the labor member of the board, shall be called upon, under conditions to be laid down by it, to agree upon a person or persons who shall act under the direction of the board as examiner or examiners in such district. If the board deems it advisable itself to name an examiner or examiners, or if the representatives of the contractors and of the labor organization do not agree, then the board shall by unanimous action select a person or persons for such position. The examiner shall be subject to removal by the board at any time by majority vote. It shall be the duty of the district officer of the United States Shipping Board Emergency Fleet Corporation to report promptly to the board and to the examiner of the district, if such examiner shall have been appointed, any dispute with reference to wages, hours, or conditions of labor which he is unable to adjust satisfactorily to the principals concerned.

As basic standards where such construction is being carried on, the board shall use the wage rate prevailing in the district in which such plant or plants are located, provided such wage rates have been established through agreements between employer and employees and are admitted to be equitable. Consideration shall be given by the board to any circumstances arising after such wages, hours, or conditions were established and which may seem to call for changes in wages, hours, or conditions. Where no such agreements exist and where, as in the case of new industrial districts, a proper basis of wages and conditions is difficult to determine, the board shall have the right to put into effect the rates which were awarded after due investigation and determination in other districts in which living conditions and cost of living are substantially the same. The board shall keep itself fully informed as to the relation between living costs in the several districts and their comparison between progressive periods of time. The decisions of the board shall, under proper conditions, be retroactive, and it shall be the duty of the board to make the decision effective. At any time after six months have elapsed following such ratified agreement or any such final decision by the adjustment board on any question as to wages, hours, or conditions in any plant or district, such questions may be reopened by the adjustment board for adjustment upon request of the majority of the craft or crafts at such plant affected by such agreement or decision, provided it can be shown that there has been a general and material increase in the cost of living. The decisions of the board will, in so far as this memorandum may be capable of achieving such result, be final and binding on all parties: *Provided, however,* That either the employers or employees in any district may have the right to appeal from the decision rendered by the adjustment board to a board of review and appeal to be made as follows: Three members to be named jointly by the United States Shipping Board Emergency Fleet Corporation and the United States Navy Department, and three to be named by the president of the American Federation of Labor.

It is hereby stipulated and agreed that this memorandum shall supersede and stand in place of the "Memorandum for the adjustment of wages, hours, and conditions of labor in shipbuilding plants," signed August 20, 1917, and that it shall become effective this 8th day of December, 1917.

FRANKLIN D. ROOSEVELT,
Acting Secretary of the Navy.

CHARLES PIEZ,
Vice President, United States Shipping Board Emergency Fleet Corporation.

WILLIAM BLACKMAN,
Assistant to General Manager.

JAMES O'CONNELL,
President, Metal Trades Department.

JOHN I. NOLAN,
International Molders' Union of North America.

J. A. FRANKLIN,
International President of Boilermakers and Iron Shipbuilders of America.

JAMES WILSON,
President, Pattern Makers' League of North America.

MILTON SNELLINGS,
General President, International Union of Steam and Operating Engineers.

G. C. VAN DORNES,
General Vice President, International Brotherhood of Boilermakers and Helpers.

F. J. McNULTY,
International Brotherhood of Electrical Workers.

JOHN J. HYNES,
President, Amalgamated Sheet Metal Workers of America.

WILLIAM H. JOHNSTON,
International Association of Machinists, per P. Flaherty.

W. W. BRITTON,
President, International Union of Metal Polishers.

UNITED STATES EMPLOYMENT SERVICE ORGANIZED BY THE DEPARTMENT OF LABOR.

On January 3, 1918, the Secretary of Labor, W. B. Wilson, announced the separation from the Bureau of Immigration, under whose control it has been for the past 10 years, of that branch of the Department of Labor handling employment matters, and its reorganization and expansion immediately in the office of the Secretary of the Department. The Employment Service has been organized as the Nation's war-labor mobilizing and distributing machine and has already become one of the largest and most important war prosecuting agencies of the National Government. In order to disseminate as widely as possible official information connected with the activities of the service, the needs of the Government for workers in all branches of industry and the methods to be pursued by the Employment Service in bringing laborers and jobs together with a view to a speedy and efficient prosecution of the war, a weekly bulletin is now being published, the first issue of which appeared on January 28, 1918.

It is called the "U. S. Employment Service Bulletin," and in this initial issue an editorial announcement is made that "its primary purpose is to distribute information and promote coordination among the officials and employees of the Federal Employment Service and of the cooperating State and municipal employment offices and State councils of defense." The following statement, outlining the work and organization of the Employment Service, has been authorized by the director:

The organization of the Service to meet the labor-distribution problem is one of the features of the national war-labor program, the administration of which has been delegated to Secretary Wilson and the department. It will be the task of the extended Service to furnish millions of workers for the various war industries. It is estimated that by August between 3,000,000 and 4,000,000 workers will be needed in agriculture, shipbuilding, munitions making, and other essential industries.

John B. Densmore, of Montana, for the past five years Solicitor for the Department of Labor, has been appointed Director of the United States Employment Service by Secretary Wilson. Charles T. Clayton, of Maryland, is assistant director.

The details of the operation of this national labor distribution machinery will be managed by four divisions, the chiefs of which, together with the director and assistant director, will constitute a policies board. The statistical data in connection with the employment service will be tabulated and published from time to time by the Bureau of Labor Statistics of the Department of Labor. The following are the four divisions, with the names of their respective chiefs:

Division of Information, Administration, and Clearance.—T. V. Powderly, of Pennsylvania, chief.

Woman's Division.—Mrs. Hilda Muhlhauser Richards, of Ohio, chief.

Division of Reserves.—William E. Hall, of New York, national director of the United States Public Service Reserve and the United States Boys' Working Reserve, chief.

Farm Service Division.—A. L. Barkman, of Missouri, chief.

For several months the Department of Labor has been quietly working to equip the Federal Employment Service to handle efficiently the problems of supplying war labor. Funds appropriated specially by Congress or allotted by the President from his war-emergency fund are believed to be sufficient to conduct the Service until the end of the fiscal year.

The Service is now covering the entire continent with a network of labor exchanges. Federal, State, and municipal employment offices and the facilities of the various State councils of defense are being utilized and made coordinate parts of this comprehensive Federal machine. Complete centralization and unification of all efforts to supply labor are thus effected, eliminating all duplication and waste of effort, time, and expenditures. There are already more than 200 such exchanges in operation, and the immediate establishment of 50 more in various parts of the country is now being arranged.

With these labor exchanges as the medium for the distribution of workers and their placement in the war industries a vast reservoir of skilled and boy workers to meet the additional demands of the essential industries is being created by the United States Public Service Reserve and the United States Boys' Working Reserve, both comprising a division of the Federal Employment Service. The reserves are, in effect, the Service's "recruiting service." Already about 30,000 skilled workers have been enrolled in the Public Service Reserve and approximately 150,000 boys between

the years of 16 and 21 in the Boys' Working Reserve. Both bodies are now placing men and boys in industrial service through the machinery of the Employment Service.

In connection with the work of the Service and its reserves, a corps of traveling examiners is being created. These examiners will cover the country and determine the fitness of applicants for shipbuilding and other war industrial work. They will have the cooperation of the enrolling officers of the Public Service Reserve throughout the country, employers, labor leaders, chambers of commerce, and other business organizations, and patriotic persons generally. By means of these examiners it is anticipated that few men will be placed in positions for which they are not fitted, and there will be real conservation of the available supply of skilled workers. "Maximum service from every worker" is a cardinal principle of the reorganized Employment Service.

The new organization of the United States Employment Service, and particularly its operation as a separate arm of the Department of Labor, meets with the full approval of both employers and employees. Since the entrance of the United States into the War, the American Federation of Labor, speaking for organized labor, and the Chamber of Commerce of the United States, representing employers and the Nation's business men generally, have officially urged the action that has just been taken. Many of the international unions affiliated with the American Federation of Labor recently have pledged assistance to the Public Service Reserve in the enrollment of their members and their placement in "war jobs" as they arise.

The following statement is made by John B. Densmore, director of the newly organized Employment Service:

The United States Employment Service can successfully meet the problem of war-labor supplying if full support is given by both workers and employers. Our task will be made easier when the country as a whole realizes that a national labor shortage is a myth and that a conscription of labor is both impracticable and unnecessary.

There is no real labor shortage. While there exists a scarcity of workers in a few of the highly skilled and unusual trades, the apparent general labor shortage, especially in Pennsylvania and other industrial States, has been due to a lack of distribution facilities. In some sections there are large surpluses of workers, and these will be taken to the shorthanded regions as quickly as possible. Our national labor problem is primarily one of proper distribution, and the new organization of the Employment Service provides adequate facilities. The leading trades-unions and business organizations of the country are now cooperating with the United States Employment Service, and will assist in the distribution of labor and in the enrollment of workers for "war service" in the United States Public Service Reserve.

EFFECT OF DILUTION OF LABOR IN A SHELL FACTORY.

The following article on the effect of dilution of labor in one of the national shell factories of Great Britain is reprinted, by special permission, from the *Dilution of Labor Bulletin*, published by the British Ministry of Munitions, December, 1917.

Experience has frequently shown how uneconomical it is to employ a highly skilled mechanic on work of a repetition nature. Always supposing that there is no conscious restriction of output on the man's part, his pride of craftsmanship impels him to spend time in producing a finish and an accuracy greater than the nature of the work demands. Moreover, as a rule he does not take kindly to the easy and fool-proof methods of manufacture which give no opportunity for the use of his experience and trained intelligence. It is to the national interest, and should be to the man's own interest, that he should be employed on work which really needs his skill, and which can not be done without it.

The unskilled man or woman, when introduced to a job, has nothing to unlearn; and provided that the operations have been laid out systematically beforehand, as they should have been, the unskilled operator has very little to learn. In view of what has been said above, therefore, it is not surprising that with proper tools and supervision, he will frequently, and one might perhaps say generally, attain an output which the skilled supervisor himself could not equal. It must not always be assumed that this is discreditable to the skilled mechanic. It is, however, always to his credit that he can train unskilled labor to such a degree of efficiency, and it proves conclusively that his proper place is that of a charge hand rather than that of a machine operator.

The following case, recorded by one of the national shell factories, may be mentioned as one example out of many where a markedly greater output has resulted from the substitution of unskilled labor for skilled labor. The factory in question is producing 9.2-inch Mark IX H. E. shell, and the boring of the interior of the shell is done in three distinct operations, namely, rough-boring the body, rough-boring the head, and finish-boring the complete shell. The work is done on Lang boring lathes, and the appended table gives the comparison between the output of skilled men and women under identical conditions.

TABLE I.

Operation.	Average output per 10-hour shift.	
	Skilled men.	Women.
Rough-boring parallel part of body..	8	First week..... 7
		After 6 weeks..... 17
		After 10 weeks..... 20
		At present..... 24
Rough-boring head to blend with body.	11	After 1 week..... 8½
		After 6 weeks..... 14
		After 10 weeks..... 18
		After 14 weeks..... 20
		At present..... 24
Finish-boring shell.....	10	After 1 week..... 10
		After 5 weeks..... 14
		After 9 weeks..... 16
		At present..... 24

It will be seen that whereas the complete boring of the shell required 3.16 machine-hours when done by skilled men, it was accomplished in 3.6 hours by women after only one week's practice, and within two or three months the women had reduced

the time to 1.25 hours, thus increasing the output to two and a half times its previous figure.

Several months ago, as a result of the visit of officers of the ministry to the factory in question, 73 skilled men were enrolled as war-munitions volunteers and transferred to other works. Unskilled and semiskilled men to the number of 133 were released, and the places of all the above men were taken by females.

Table II shows the change that has been brought about since the beginning of the year in the 9.2-inch shell shop and the 4.5-inch shell shop and the copper-band shop, respectively. The figures speak for themselves, but the greatly increased output in both shops, corresponding with the increase in the percentage of women and discharged soldiers employed, is worthy of special notice.

TABLE II.
9.2-inch shell shop.

	January, 1917.	October, 1917.	Per cent of increase (+) or decrease (-).
Men (excluding discharged soldiers).....	123	61	- 50.4
Discharged soldiers.....		17	
Women.....	79	137	+ 73.4
Boys.....		10	
Total.....	202	225	+ 11.4
Shell output per month.....	950	2,369	+149.3
Shell output per employee.....	4.7	10.5	+123.4

4.5-inch shell shop.

Men (excluding discharged soldiers).....	164	83	-49.4
Discharged soldiers.....		17	
Women.....	358	530	+48.1
Boys.....	19	2	-89.5
Total.....	541	632	+16.8
Shell output per month.....	19,000	30,000	+57.9
Shell output per employee.....	35.1	47.4	+35.0

Copper-band department.

Men (excluding discharged soldiers).....	38	32	- 15.7
Discharged soldiers.....		5	
Women.....	85	124	+ 45.9
Boys.....		11	
Total.....	123	172	+ 39.8
Output per month (all sizes).....	160,000	392,000	+145.0
Output per employee.....	1,300	2,284	+ 76.5

With regard to the output of 9.2-inch shells, it will be observed that the proportion of women to total employees is now practically 61 per cent. This is a very creditable proportion, and contrasts very favorably with the conditions existing in many shops engaged upon the same class of shell. Dilution, however, is still proceeding and it is confidently anticipated that an output of 3,000 shells per month will be obtained with a still higher proportion of women and discharged soldiers. Excellent as the present position and the future prospects are, the place of honor is probably held by the 9.2-inch shell factory referred to in the November issue of the Bulletin. In this factory, where women operate the whole of the machines and do all the laboring, the

proportion of women to total employees is just on 90 per cent and the output of completed shell per employee per month is over eighteen.

In the 4.5-inch shell shop of the national factory under consideration the machines were not originally designed for shell work and are in a bad state of repair. Moreover, during the period under review over 15,000 shells of exceptionally hard steel have had to be made, otherwise the increase of output would have been greater even than it has been.

The facts given in this article should be of material assistance in convincing engineers that there is nothing incompatible in the apparently contradictory duties laid upon them in the national interest, firstly to increase the output of munitions, secondly to release every skilled and able-bodied man for work which only such men can do, and lastly but not least important, to find remunerative occupation for discharged soldiers "broken in our wars."

BRITISH GOVERNMENT'S ATTITUDE ON JOINT STANDING INDUSTRIAL COUNCILS.¹

The British War Cabinet has decided to adopt the Whitley report on joint standing industrial councils as a part of the policy which it hopes to carry into effect in the field of industrial reconstruction. This report proposed the establishment of such councils in the various industries where they do not already exist, to be composed of representatives of employers and employees, for the purpose of considering matters affecting the industry, and particularly the establishment of a closer cooperation between employers and workers. The report was published in full in Bulletin 237 of this bureau. To answer certain questions which have been raised regarding the purpose of establishing industrial councils, the minister of labor, under date of October 20, 1917, addressed the following letter to the leading employers' associations and trade-unions, explaining in full the Government's view of the proposals of the report:

SIR: In July last a circular letter was addressed by the Ministry of Labor to all the principal employers' associations and trade-unions asking for their views on the proposals made in the report of the Whitley committee on joint standing industrial councils, a further copy of which is inclosed. As a result of the replies which have been received from a large number of employers' organizations and trade-unions generally favoring the adoption of those proposals, the War Cabinet have decided to adopt the report as part of the policy which they hope to see carried into effect in the field of industrial reconstruction.

In order that the precise effect of this decision may not be misunderstood, I desire to draw attention to one or two points which have been raised in the communications made to the ministry on the subject, and on which some misapprehension appears to exist in some quarters.

In the first place, fears have been expressed that the proposal to set up industrial councils indicates an intention to introduce an element of State interference, which has hitherto not existed in industry. This is not the case. The formation and constitution of the councils must be principally the work of the industries themselves.

¹ Great Britain, Ministry of Labor. Industrial Reports. No. 1. Industrial councils. The Whitley report, together with the letter of the minister of labor explaining the Government's view of its proposals. 1917. 19 pp. Price 1d.

Although, for reasons which will be explained later, the Government is very anxious that such councils should be established in all the well-organized industries with as little delay as possible, they fully realize that the success of the scheme must depend upon a general agreement among the various organizations within a given industry and a clearly expressed demand for the creation of a council. Moreover, when formed, the councils would be independent bodies, electing their own officers, and free to determine their own functions and procedure with reference to the peculiar needs of each trade. In fact, they would be autonomous bodies, and they would, in effect, make possible a larger degree of self-government in industry that exists to-day.

Secondly, the report has been interpreted as meaning that the general constitution which it suggests should be applied without modification to each industry. This is entirely contrary to the view of the Government on the matter. To anyone with a knowledge of the diverse kinds of machinery already in operation, and the varying geographical and industrial conditions which affect different industries, it will be obvious that no rigid scheme can be applied to all of them. Each industry must therefore adapt the proposals made in the report as may seem most suitable to its own needs. In some industries, for instance, it may be considered by both employers and employed that a system of works committees is unnecessary, owing to the perfection of the arrangements already in operation for dealing with the difficulties arising in particular works between the management and the trade-union officials. In other works committees have done very valuable work where they have been introduced and their extension on agreed lines deserves every encouragement. Again in industries which are largely based on district organizations it will probably be found desirable to assign more important functions to the district councils than would be the case in trades which are more completely centralized in national bodies. All these questions will have to be thrashed out by the industries themselves and settled in harmony with their particular needs.

Thirdly, it should be made clear that representation on the industrial councils is intended to be on the basis of existing organizations among employers and workmen concerned in each industry, although it will, of course, be open to the councils, when formed, to grant representation to any new bodies which may come into existence and which may be entitled to representation. The authority, and consequently the usefulness of the councils will depend entirely on the extent to which they represent the different interests and enjoy the whole-hearted support of the existing organizations, and it is therefore desirable that representation should be determined on as broad a basis as possible.

Lastly, it has been suggested that the scheme is intended to promote compulsory arbitration. This is certainly not the case. Whatever agreements may be made for dealing with disputes must be left to the industry itself to frame, and their efficacy must depend upon the voluntary cooperation of the organizations concerned in carrying them out.

I should now like to explain some of the reasons which have made the Government anxious to see industrial councils established as soon as possible in the organized trades. The experience of the War has shown the need for frequent consultation between the Government and the chosen representatives of both employers and workmen on vital questions concerning those industries which have been most affected by war conditions. In some instances different Government departments have approached different organizations in the same industry, and in many cases the absence of joint representative bodies which can speak for their industries as a whole and voice the joint opinion of employers and workmen, has been found to render negotiations much more difficult than they would otherwise have been. The case of the cotton trade, where the industry is being regulated during a very difficult time by a joint board of control, indicates how greatly the task of the State can be alleviated

by a self-governing body capable of taking charge of the interests of the whole industry. The problems of the period of transition and reconstruction will not be less difficult than those which the War has created, and the Government accordingly feel that the task of rebuilding the social and economic fabric on a broader and surer foundation will be rendered much easier if in the organized trades there exist representative bodies to which the various questions of difficulty can be referred for consideration and advice as they arise. There are a number of such questions on which the Government will need the united and considered opinion of each large industry, such as the demobilization of the forces, the resettlement of munition workers in civil industries, apprenticeship (especially where interrupted by war service), the training and employment of disabled soldiers, and the control of raw materials; and the more it is able to avail itself of such an opinion the more satisfactory and stable the solution of these questions is likely to be.

Further, it will be necessary in the national interest to insure a settlement of the more permanent questions which have caused differences between employers and employed in the past, on such a basis as to prevent the occurrence of disputes and of serious stoppages in the difficult period during which the problems just referred to will have to be solved. It is felt that this object can only be secured by the existence of permanent bodies on the lines suggested by the Whitley report, which will be capable not merely of dealing with disputes when they arise, but of settling the big questions at issue so far as possible on such a basis as to prevent serious conflicts arising at all.

The above statement of the functions of the councils is not intended to be exhaustive, but only to indicate some of the more immediate questions which they will be called upon to deal with when set up. Their general objects are described in the words of the report as being "to offer to workpeople the means of attaining improved conditions of employment and a higher standard of comfort generally, and involve the enlistment of their active and continuous cooperation in the promotion of industry." Some further specific questions, which the councils might consider, were indicated by the committee in paragraph 16 of the report, and it will be for the councils themselves to determine what matters they shall deal with. Further, such councils would obviously be the suitable bodies to make representations to the Government as to legislation, which they think would be of advantage to their industry.

In order, therefore, that the councils may be able to fulfill the duties which they will be asked to undertake, and that they may have the requisite status for doing so, the Government desire it to be understood that the councils will be recognized as the official standing consultative committees to the Government on all future questions affecting the industries which they represent, and that they will be the normal channel through which the opinion and experience of an industry will be sought on all questions with which the industry is concerned. It will be seen, therefore, that it is intended that industrial councils should play a definite and permanent part in the economic life of the country, and the Government feels that it can rely on both employers and workmen to cooperate in order to make that part a worthy one.

I hope, therefore, that you will take this letter as a formal request to your organization on the part of the Government to consider the question of carrying out the recommendations of the report so far as they are applicable to your industry. The Ministry of Labor will be willing to give every assistance in its power in the establishment of industrial councils, and will be glad to receive suggestions as to the way in which it can be given most effectively. In particular, it will be ready to assist in the convening of representative conferences to discuss the establishment of councils, to provide secretarial assistance and to be represented, if desired, in a consultative capacity at the preliminary meetings. The Ministry will be glad to be kept informed of any progress made in the direction of forming councils. Although the scheme is only

intended, and indeed can only be applied, in trades which are well organized on both sides, I would point out that it rests with those trades which do not at present possess a sufficient organization to bring it about if they desire to apply it to themselves.

In conclusion, I would again emphasize the pressing need for the representative organizations of employers and workpeople to come together in the organized trades and to prepare themselves for the problems of reconstruction by forming councils competent to deal with them. The Government trust that they will approach these problems not as two opposing forces each bent on getting as much and giving as little as can be contrived, but as forces having a common interest in working together for the welfare of their industry, not merely for the sake of those concerned in it, but also for the sake of the nation which depends so largely on its industries for its well-being. If the spirit which has enabled all classes to overcome by willing cooperation the innumerable dangers and difficulties which have beset us during the War is applied to the problems of reconstruction, I am convinced that they can be solved in a way which will lay the foundation of the future prosperity of the country and of those engaged in its great industries.

I am, sir, your obedient servant,

GEO. H. ROBERTS.

AGREEMENT BETWEEN ENGINEERING EMPLOYERS' FEDERATION AND TRADE-UNIONS IN GREAT BRITAIN.

In the latter part of 1917 a serious strike of airplane workers occurred at Coventry, England, in which the matter of the appointment and functions of shop stewards became acute. An agreement was finally entered into between the Engineering Employers' Federation and the trade-unions concerned, the text of which, taken from the London Morning Post of December 24, 1917, has been sent by the American consul general at London to the State Department and forwarded to this bureau. It appears that the Amalgamated Society of Engineers, the Scientific Instrument Makers' Union, and the Enginemen's Union did not subscribe to the terms, their representatives not being present when the settlement was drawn up, but it is understood by the Engineering Employers' Federation that the two last-mentioned unions are willing to agree to the settlement, although the Amalgamated Society of Engineers still remains outside. The agreement covering regulations regarding the appointment and functions of shop stewards is as follows:

With a view to amplifying the provisions for avoiding disputes it is agreed:

1. The workmen who are members of the above-named trade-unions, employed in a federated establishment, may appoint representatives from their own number to act on their behalf in accordance with the terms of the agreement.
2. The representatives shall be known as shop stewards.
3. The method of election of shop stewards shall be determined by the trade-unions concerned, and each trade-union parties to this agreement may appoint shop stewards.
4. The names of the shop stewards and the shop or portion of a shop in which they are employed and the trade-union to which they belong shall be intimated officially by the trade-union concerned to the management on election.

5. Shop stewards shall be subject to the control of the trade-unions, and shall act in accordance with the rules and regulations of the trade-unions and agreements with employers so far as these affect the relation between employers and workpeople.

6. In connection with this agreement shop stewards shall be afforded facilities to deal with questions raised in the shop or portion of a shop in which they are employed. In the course of dealing with these questions they may, with the previous consent of the management (such consent not to be unreasonably withheld) visit any other shop or portion of a shop in the establishment. In all other respects they shall conform to the same working conditions as their fellow workmen.

7. Employers and shop stewards shall not be entitled to enter into any agreement inconsistent with agreements between the Engineering Employers' Federation or local associations and the trade-unions.

8. The function of shop stewards, so far as they are concerned with the avoidance of disputes, shall be exercised in accordance with the following procedure:

(a) A workman or workmen desiring to raise any question in which he or they are directly concerned shall in the first instance discuss the same with his or their foreman. (b) Failing settlement, the question shall, if desired, be taken up with the management by the appropriate shop steward and one of the workmen directly concerned. (c) If no settlement is arrived at the question may, at the request of either party, be further considered at a meeting to be arranged between the management and the appropriate shop steward, together with a deputation of the workmen directly concerned. At this meeting the organizing district delegate may be present, in which event a representative of the employers' association shall also be present. (d) The question may thereafter be referred for further consideration in terms of the provisions for avoiding disputes. (e) No stoppage of work shall take place until the question has been fully dealt with in accordance with this agreement and with the provisions for avoiding disputes.

9. In the event of a question arising which affects more than one branch of trade or more than one department of the works the negotiation thereon shall be conducted by the management with the shop stewards concerned. Should the number of shop stewards concerned exceed seven a deputation shall be appointed by them, not exceeding seven, for the purpose of the particular negotiation.

10. Negotiations under this agreement may be instituted either by the management or by the workmen concerned.

11. The recognition of shop stewards is accorded in order that a further safeguard may be provided against disputes arising between the employers and their workpeople.

12. Any questions which may arise out of the operation of this agreement shall be brought before the executive of the trade-union concerned or the federation as the case may be.

DECREASE IN NIGHT WORK OF WOMEN IN FRANCE.¹

The need for intensifying the production of war munitions and material has, since the beginning of the war, led in France to a relaxation of the laws and regulations concerning the maximum duration of the working day, concerning the labor of women and children, and concerning night work. Especially as regards night work for women, frequent exemptions from the law have been

¹ From report of C. W. A. Veditz, American Commercial Attaché, Paris, to Department of Commerce.

granted. But serious social disadvantages soon became apparent as the result of these exemptions, and the public authorities began restricting their number.

A circular dated June 29, 1916, prescribed certain limits for the employment of women at night work. Then, gradually, employers themselves undertook to restrict further the employment of female labor at night. The result, as shown by an investigation begun by the Ministry of Labor on May 31, 1917, is that female labor at night has been reduced almost to insignificant proportions.

The investigation comprised 787 private industrial establishments, employing at night 58,784 women, or 36 per cent of the total number of women working in these establishments. Of the above number, 519 were under 16 years of age, and 1,576 were between 16 and 18 years of age. The average duration of night work was 10 hours. It is reported that improvements have been made everywhere in the conditions and circumstances affecting the night work of the women. Husband and wife are employed at the same hours, so that they may take their meals together; there are eight-hour shifts, so that night work is required of each shift only one week in three; women are intrusted with the lighter kinds of work; the rest periods have been made more numerous; and female workers living in the same quarter of the town are grouped together in the factory.

In the belief that in the interest of the family further modifications might be made in the same direction without jeopardizing the requirements of the national defense, the committee in charge of female labor conditions gave expression to a certain number of desiderata which will soon be carried into effect. It is urged that no girls or women under 18 years of age be employed at night, and that night work for women in no case be permitted to last longer than 10 hours. It is also urged that night work for women of all ages, tolerated since the beginning of the war by suspension of the rules on this subject, shall be suppressed whenever the conditions affecting the supply of raw materials, of motive power, and of labor, are such as to make it possible to obtain the same output by means of day labor alone; that when the output of a factory is decreased night work be curtailed first of all for women; that whenever the hours of labor are decreased, the reduction apply first to night work; that so far as possible, mobilized married laborers be sent by preference to shops and factories in which their wives are engaged.

It is evident from these steps that the French authorities are giving serious thought to the readjustment of the labor situation, especially as it affects women employed in munitions works, that will be necessary after the cessation of hostilities.

PROVISION FOR DISABLED SOLDIERS AND CIVILIANS.

PROBLEM OF THE HANDICAPPED MAN IN INDUSTRY.

BY CARL HOOKSTADT.

The reemployment of the partially disabled and handicapped men in industry presents many complex and difficult problems. Assuming that an injured man has received full compensation benefits in accordance with the law and has been functionally restored and industrially reeducated, what then? From the industrial and compensation viewpoint he constitutes an extrahazardous risk. Not only is he more liable to injury and to be a greater source of danger to his fellow workmen than a normal man, but the consequences resulting from an injury would be greatly increased. The loss of an eye of a normal worker causes disability variously estimated at 30 per cent, and compensation is granted usually for 100 weeks. The loss of the second eye of a man who had already lost one eye would result in permanent total disability, which is usually compensable for life. Under the circumstances discrimination against the employment of such physically defective men would be a natural consequence. In fact, such discrimination has been and is being constantly practiced by employers throughout the country. However, assuming that the partially disabled would not be discriminated against, what effect would the employment of such men have upon wages? Would it result in lowering the labor standards? Would it mean the displacement of the normal workman by the crippled workman? Instances are on record where standard workers have been displaced by crippled workers at lower wages. Furthermore, the reemployment of the partially disabled men should be earnestly considered in conjunction with the whole problem of employment and unemployment of normal workers. Surely, unemployment of the physically normal is just as important a social problem as the unemployment of the physically defective. Organized labor may well look askance at any scheme of rehabilitation which does not also include a plan for the protection of labor standards. All these questions must be considered in working out a practical and equitable plan.

The foregoing problems are primarily concerned with the industrially disabled. More difficulties arise when the military cripples are considered. At the present time the Federal Government through its Bureau of War-Risk Insurance pays compensation benefits to our soldiers and sailors disabled in the service, and provision has also been made for their functional and professional rehabilitation. Presumably compensation payments will continue until the men are replaced in industrial and commercial life. But again we are confronted with the present disinclination and the probable future refusal to give employment to such men. Sentiment and patriotic ardor can not be relied upon to solve the problem. It has been suggested that in order to prevent industrial discrimination against disabled men a premium be placed upon their employment by relieving the employer of the extrahazardous risks which such employment would entail.

Very few of the States have attempted a solution of this problem. The provisions of the 40 State and Territorial compensation laws relating to compensation for second or successive injuries are as follows: Eight States¹ provide that compensation for second injuries shall be computed on the basis of the disability caused by that particular injury without reference to previous injuries. Fifteen States² provide that compensation for second injuries shall be determined by subtracting the disability caused by the prior injury from the whole disability caused by subsequent injury. The phraseology used in some of the laws, however, is indefinite and susceptible of more than one interpretation. Of these 15 States, 4—Kansas, Kentucky, Nevada, and Wyoming—definitely state that compensation for subsequent injuries shall be based upon the disability caused by such injuries minus the disability caused by previous injuries; 4 States—Maryland, Montana, Oregon, and Washington—provide that compensation shall be determined in accordance with the combined effect of the injuries and past compensation paid; 2—Illinois and South Dakota—state that compensation shall be apportioned according to the proportion of incapacity caused by the respective injuries; while 5—Maine, Michigan, Oklahoma, Rhode Island, and Wisconsin—provide merely that compensation shall be based on the reasonable earning capacity of the employee at the time of the later injury; but in Wisconsin greater compensation is awarded for second injuries (eye and hearing only) than for primary injuries. Seventeen States³ make no specific provision in this

¹ California, Colorado, Indiana, Delaware, Minnesota, Nebraska, New York, and Texas.

² Illinois, Kansas, Kentucky, Maine, Maryland, Michigan, Montana, Nevada, Oklahoma, Oregon, Rhode Island, South Dakota, Washington, Wisconsin, and Wyoming.

³ Alaska, Arizona, Connecticut, Hawaii, Idaho, Iowa, Louisiana, Massachusetts, New Hampshire, New Jersey, New Mexico, Ohio, Pennsylvania, Porto Rico, Utah, Vermont, and West Virginia.

respect, but undoubtedly the administrative commissions or courts have ruled upon the question in cases coming before them for adjudication. In Massachusetts and West Virginia, compensation is granted for the entire disability resulting from the subsequent injury. For example, compensation for total permanent disability would be awarded for the loss of a second eye.

A better conception of the different provisions in force in the various States may perhaps be obtained by way of illustration. What would be the effect, for example, of the loss of the second hand in the several classes of States. In Indiana compensation would be limited to 55 per cent of the weekly wages for 150 weeks. In New York the employee would receive 66 $\frac{2}{3}$ per cent of his weekly wages for 244 weeks and at the expiration of this period an additional 66 $\frac{2}{3}$ per cent for life; such additional compensation to be paid out of a special fund and not be borne by the employer in whose employment the injury was sustained. In Kentucky the employee would be entitled to 65 per cent of weekly wages for permanent total disability (416 weeks) minus the compensation for loss of the first hand (150 weeks) or 266 weeks. While in Massachusetts the employee would receive 66 $\frac{2}{3}$ per cent of his wages for 50 weeks for the loss of the hand; 66 $\frac{2}{3}$ per cent of wages additional for total disability during the healing period; and a further 66 $\frac{2}{3}$ per cent of his *wage loss* for partial disability for not exceeding 500 weeks.

From the viewpoint of workmen's compensation, the disabled and handicapped workman presents two main problems: First, on what basis should a workman already partially disabled be compensated when he sustains a second injury which produces greater disability than would have resulted had he not had the previous injury? Second, to what extent will the future wages of such disabled workmen and the discrimination against them, in their endeavor to obtain employment in industry, be affected by the statutory liability of the employer provided for in the compensation law?

As to the first problem: The whole purpose of compensation legislation would be defeated if injured employees are not to be compensated at least in accordance with their loss of earning capacity. It makes no difference, for example, to a totally disabled workman whether the disability was caused by a single accident or by several successive accidents. The ability of an armless man to earn a livelihood is not affected by the fact as to whether he lost both his arms at once or one at a time. He is totally and permanently disabled and compensation should be based upon this fact.

As to the second problem: It is undoubtedly true that there are many employers who, from unselfish and patriotic motives, will employ disabled men even if such men will become extra hazardous

risks and their employment result in financial loss. But the future welfare of our industrial and military cripples can not for a moment be left to the mercy and generosity of the employers of the country, no matter how exalted their motives or how generous their practices. Common economic justice demands that these men have full legal protection.

What then are some of the practical methods through which justice to the worker and equity to the employer can be secured. The New York compensation law is the only act in which an effort has been made to solve this problem. This law provides that an employee who is suffering from a previous disability shall not receive compensation for a later injury in excess of the compensation allowed for such injury when considered by itself and not in conjunction with the previous disability. However,

If an employee who has previously incurred permanent partial disability through the loss of one hand, one arm, one foot, one leg, or one eye incurs permanent total disability through the loss of another member or organ, he shall be paid, in addition to the compensation for permanent partial disability provided in this section and after the cessation of the payments for the prescribed period of weeks, special additional compensation for the remainder of his life to the amount of 66 $\frac{2}{3}$ per centum of the average weekly wage earned by him at the time the total permanent disability was incurred. Such additional compensation shall be paid out of a special fund created for such purpose in the following manner: The insurance carrier shall pay to the State treasurer for every case of injury causing death in which there are no persons entitled to compensation the sum of \$100. The State treasurer shall be the custodian of this special fund, and the commission shall direct the distribution thereof.¹

One method, therefore, would be the extension of the New York plan to all the other compensation States; but instead of limiting the scope to certain major injuries, as provided for in New York, it should be increased to include all permanent partial disabilities. The liability of an employer for compensation for disability caused by a second injury could be limited to the disability resulting from that particular injury without reference to any prior disabilities. Compensation for the remaining disability could be paid out of a special fund. This fund could be created according to the New York plan, or it could be established by requiring all employers in the State to contribute a small premium sufficient to meet the needs. Such premiums are at present required from employers in Ohio and West Virginia, but for other purposes. The law of Idaho also provides that in fatal cases involving no dependents, the employer must pay \$1,000 into the industrial administration fund.

Another suggestion, rather sweeping and drastic in character, would be to prohibit employers from carrying their own risk and compelling every employer to insure either in the State insurance

¹ New York compensation act, sec. 15, par. 7.

fund or in private casualty companies. Undoubtedly, discrimination against the employment of disabled workers is more prevalent among self-insurers than among insured employers, because there is a greater and more direct connection between the accident and the cost of compensation. If all employers are insured, the employment of the disabled will be reflected in a general increased premium rate, but the individual employer would not be penalized because of the employment of cripples. Discrimination against such employers by insurance companies could be prevented by appropriate legislation.

The above plans, of course, would be applicable only to States having compensation laws and then only to those employments covered by these laws. Eleven States and the District of Columbia have no workmen's compensation laws. Furthermore, only one or two of the State laws cover agriculture and domestic service, while over one-third do not include the professions, trades, and other non-hazardous employments. On the other hand, our soldiers are drawn from every State in the Union and from every walk of life, and this fact must be taken into account in the formulation of an adequate and just plan.

The United States Bureau of War-Risk Insurance recently called a conference composed of Federal and State compensation officials, representatives of labor organizations and insurance carriers, and other experts in workmen's compensation. As a result of this conference a committee was appointed to draw up two plans embodying the conclusions reached.

The first plan is simple. Its underlying principle is that the disabled soldiers and sailors are wards of the Nation. It provides that the Federal Government shall pay the entire costs of compensation for injuries, including those subsequently sustained in civil life as well as those sustained in the military service. This would place a premium upon the employment of these men and would eliminate any fear of discrimination. It has the further advantage of not being dependent upon State compensation laws. One difficulty, however, is that such disabled men will be entitled to compensation under the State laws for subsequent injuries irrespective of whether the Federal Government pays them for such injuries or not. Nor is it clear whether they waive their right to State compensation, because most of the State laws absolutely forbid waivers of this kind.

The second plan provides that the cost of subsequent injuries shall be shared jointly by the Federal Government and the State, or rather the employers in the State. The employer's liability for compensation shall be limited to the disability caused by the subsequent

injury alone without reference to any prior disabilities. The amounts thus contributed by the several States would vary, however, in accordance with the varying provisions of the laws. Compensation for the remaining disability shall be paid by the United States out of a special fund. In the case of awards for damages in the non-compensation States the Federal Government would bear its proportionate share of the jury award, and the employer would be subrogated to the employee's rights for claims against the United States special fund. The advantage of this plan is that under it the industry bears its share of the cost of industrial accidents, and it would be free of the charge of class legislation. On the other hand, it would give rise to numerous administrative difficulties, both Federal and State, and would, in addition, require amendatory State legislation.

ECONOMIC CONSEQUENCES OF PHYSICAL DISABILITY.

The Red Cross Institute for Crippled and Disabled Men was established for the purpose of training and readjusting to industry men permanently crippled by the War or injured in the course of their employment. To anticipate the need of practical knowledge of how to deal with these problems of industrial readjustment, an investigation was undertaken by the institute during the summer of 1917 into the experiences of cripples in civil life. A recently issued publication entitled "Economic Consequences of Physical Disability; A Case Study of Civilian Cripples in New York City,"¹ describes in detail the methods employed and results obtained by this investigation.

Records of 361 men between the ages of 16 and 55 whose injuries had occurred since January 1, 1915, were obtained from various sources. The investigators visited 20 hospitals in New York City which kept records of amputations, and chose 327 cases for visitation. Of this number, case histories of only 129 were actually obtained. Records of 332 men receiving compensation for injuries which occurred in the course of their employment were obtained from the State Industrial Commission. Most of these were amputation cases. Of this number 172 furnished case histories. The Interborough Rapid Transit Co. furnished records of 10 cases of men injured in employment and receiving compensation and case histories were secured from nine of these.

In addition to the above cases, 33 met incidentally by the investigators in their rounds furnished data and the employment bureau

¹ The Economic Consequences of Physical Disability; A Case Study of Civilian Cripples in New York City, by John Culbert Faries, of the Staff of the Red Cross Institute. New York, Red Cross Institute for Crippled and Disabled Men, 1918. 11 pp. (Publication Ser. 1, no. 2.)

for the handicapped conducted by the Federation of Associations for Cripples supplied the remaining 18 of the 361 cases studied.

The records of the compensation cases were particularly good, since they revealed the man's economic condition. The hospital cases yielded the largest number of men who had not adjusted themselves to industry. Sixty-four of the 129 cases were unemployed, while only 41 of the 172 industrial commission records showed cases of unemployment.

Records were made of the economic experiences of the men visited, including their industrial history before and after accident and any other facts bearing on the problem of readjustment as obtained from the man himself, his family or friends.

The infinite variety of experiences encountered made it impossible to arrive at formulas for dealing with the crippled, but stories of men who have succeeded in spite of handicaps and of those who have not, were found to be suggestive of what may be attempted for others similarly situated.

The following section of the report seems sufficiently suggestive to warrant its reproduction:

The cases chosen for study were mostly those who had suffered an amputation, either by accident or as the result of disease, or who had lost the use of a member. As the loss of a hand or arm has a different import in industry from the loss of a foot or leg, it will be useful to divide injuries into those to the upper limbs and those to the lower.

Upper limb injuries may be subdivided into those to fingers, hands, and arms. This classification is not accurate, for the function of the hand is abridged by the loss of any finger. Similarly with the foot. But, in general, when a case is put in the class of finger injuries it indicates that the disability was not such as to entirely destroy the use of the hand. Cases classified as hand injuries usually involve extensive injury to the hand, or its amputation. The same may be said of the foot and toes.

TABLE I.

	Cases.	Em- ployed.	Unem- ployed.	Ampu- tations.	Artificial limb.
Upper limb injuries:					
Fingers.....	153	133	25	All.	-----
Hands.....	36	23	13	9	2
Arms.....	32	17	15	18	7
Total.....	226	173	53	27	9
Lower limb injuries:					
Toes.....	11	9	2	All.	-----
Feet.....	24	9	15	14	5
Legs.....	92	35	57	65	38
Total.....	127	53	74	79	43
Miscellaneous.....	8	3	5	-----	-----
Grand total.....	361	229	132	106	52

Table I classifies, according to the member affected, the 361 cases whose stories were secured. The largest proportion of finger cases came from the records of the State Industrial Commission and were the results of machine accidents.

Of the 158 finger cases, practically all of which involved amputation, 60 men (38 per cent) were employed after the injury by their former employers at the same or higher wages. They did not always return to the same operation as before—in many instances being given more suitable work. Higher pay was usually the result of a general increase in the scale of wages. Two returned to piecework but found that with their handicaps they could not turn out as much work as formerly and so could not make so high wages.

Seventy-one other finger cases had found some employment, leaving only 25, or about 16 per cent, unemployed at the time they were visited. The finger and toe cases show the smallest proportion unemployed, the proportion of the latter being 18 per cent.

Of the cases of injury to hands, 13 out of 36 were unemployed. Nine of the injuries resulted in amputations with the following results: A former switchman was reemployed by the same company at lower wages as a machinist's helper; a former baker took, with poor success, to peddling pretzels on the street; another baker found employment in a stable; one young man who lost his hand in a machine is studying in an engineering school; the other five were unemployed.

There were 32 cases of injuries to arms, 17 had found employment and 15 had not. Eighteen were cases involving the amputation of the whole or part of the arm. The industrial results in these 18 cases were as follows: 3 were reemployed—1 at the same and 2 at reduced wages; 5 had found work as watchmen or messengers at low wages; 10 were unemployed. Only 1 of these 18 had suffered no diminution in his wages, and this was due, it was quite evident, to his employer's consideration. All of the others had either accepted inferior positions or were idle.

Out of a total of 226 injuries to the upper limbs 173 (76.5 per cent) had found employment, while 53 had not.

The toe cases were unimportant from the viewpoint of industrial readjustment, for the only 2 cases unemployed were still under medical treatment.

The 24 foot cases presented a total of 15 unemployed, 9 of whom were minus a foot. Five others who had lost a foot had some employment, but at reduced wages.

The 92 leg cases involved the largest proportion of amputations and the largest proportion of unemployment. Fifty-seven were idle and 65 had suffered amputations. Of those losing a leg, only three had returned to work for their former employers, as follows: One was a billposter and now folds paper at a lower wage; one was an upholsterer and with the aid of an artificial leg is back at the same work at the same wages; the third, who lost his leg while operating a wire-pulling machine, expected to be reemployed at a different operation, but probably at the same wages. Nineteen more of those losing a leg had found employment of one kind or another.

Amputations are great economic levelers. As will be seen by the following list of employments before and after amputations, the skilled electrician, the engineer, the baker, are all reduced to the level of unskilled labor:

HANDS.

<i>Before.</i>	<i>After.</i>
Switchman.	Machinist's helper.
Baker.	Peddling pretzels.
Machine hand.	Studying.
Baker.	Stableman.

ARMS.

Engineer.	Helper in storeroom.
Machine hand.	Same.
Machine hand.	Messenger boy.
Driver.	Watchman.
Electrician.	Watchman.
Machine hand.	Delivery boy.
Ferry hand. ¹	Clerk.
Unknown. ¹	Watchman.

FEET.

Garment worker.	Unknown.
Checker.	Timekeeper.
Deck hand.	Assistant cook.
Longshoreman.	Elevator operator.
Unknown. ¹	Salesman.

LEGS.

Peddler.	Same.
Laborer.	Same.
Bill-poster.	Folder of paper.
Baker.	Tends shop.
Machinist.	Candy store.
Student. ¹	Cashier.
Teamster.	Janitor work.
Butcher.	Same.
Painter.	Employing painter.
Dental mechanic.	Same.
Helper on wagon. ¹	Peddles gum.
Haberdasher.	Jitney bus.
Machine hand.	By same employer.
Auto mechanic. ¹	Repair shop.
Brakeman.	Storekeeper.
Upholsterer.	Same.
Student.	Clerk.
Track inspector. ¹	Peddler.
Coal heaver. ¹	Peddles pencils.
Too young. ¹	Wireless operator.
Too young. ¹	Newsboy.
Too young. ¹	Office boy.

Of the 27 cases who had lost hands and arms only 9 had artificial ones. The high cost of a really efficient hand and arm debars many of the wage-earning class from acquiring them. One man had an expensive arm which he found too heavy. He had discarded it for a lighter device.

Of the nine men wearing artificial hands and arms six were employed. One of the three out of employment could not wear his hand because the stump was sore, and a second had just gotten his arm. The chances for employment seem to be considerably better for a man who has an artificial limb than for one who has not. This is particularly so when a foot or leg is gone. Seventy-nine of the 116 foot and leg cases had suffered amputations, and 43 had artificial limbs. An examination of these 43 cases leads one to believe that the possession and expert use of an artificial leg greatly improve the chances of employment. Twenty men with artificial feet and legs had

¹ Case of long standing.

found employment. The experiences of the 23 who had artificial legs and were unemployed lead one to think that with better health, or with more serviceable legs, most of them would stand a much better chance of employment. Two had new legs which they had not learned to use well; six had difficulty in wearing their legs because of sore stumps; in two cases trouble with the other leg prevented their getting about; in three cases the trouble seemed to be that the legs did not fit properly; three had worked with their artificial limbs but were temporarily idle; one man said the unsightliness of his "peg" leg had lost many jobs for him; one man had lost both legs at different times, and had only one artificial limb; another who had two artificial limbs and had been employed was idle at the time; two were boys who were very active on their artificial legs but were as yet industrially unattached.

The opinion among employers who were interviewed was that there were many occupations that might be filled by leg cripples who had the use of their hands. But it is quite essential that they get about with some facility. Many employers refuse to hire men who use crutches, but do not object to men with artificial limbs. The possession of an artificial limb, therefore, seems to be quite essential to the employment of a leg cripple.

TABLE II.

	Needing training.
Upper limb injuries:	
Fingers.....	34
Hands.....	20
Arms.....	18
Total.....	72
Lower limb injuries:	
Toes.....	3
Feet.....	11
Legs.....	42
Total.....	56
Miscellaneous.....	1
Grand total.....	129

The number of men who were thought by the investigators to need either reeducation for their old trade, or training for a new occupation, was 129. When each case was carefully considered in the light of the man's age, his education, the kind of work he had done, his attitude toward training, his knowledge of English, etc., the number was narrowed down to 61, who seemed to be hopeful candidates for such training as the Institute might be equipped to do. Probably not all of these could or would enter trade classes, but from this number there could probably be selected a number of candidates who would afford good material for the educational experiment proposed.

VILLAGE SETTLEMENTS FOR DISABLED SOLDIERS IN GREAT BRITAIN.

The following account of a scheme for village settlements intended to combine restorative treatment with industrial and social reconstruction for disabled ex-service men in Great Britain is reprinted from the *Lancet* for November 3, 1917:

For the past year a group of men and women have been engaged in working out a practical scheme of which the main objects are as follows: (1) To restore disabled

sailors and soldiers to health of mind and body; (2) to train them for settlement in villages and on the land; (3) as a natural result, to encourage the founding of small self-supplying village communities, where local industries and handicrafts shall be pursued on sound and just lines.

A provisional committee has now been constituted to carry out these aims. * * *

The following are the guiding principles of the [proposed] scheme:

Healing and restoration after certain types of disablement is a slow and tedious process, demanding patience and faith. The training for a new trade or profession or for some modification of the old is also a slow process. It seems, therefore, a matter of common sense and humanity to carry on the two together and to provide for each man who needs it a system of curative treatment, combined with manual or mental training, such as will cure his disabilities, develop his natural gifts, and equip him to become, as far as possible and at the earliest possible date, a self-supporting citizen.

The committee desire that a large number of disabled and delicate men may be trained for rural life and village crafts, believing that in a congenial rural life lies the cure for their physical and mental ills. They must be attracted to the training center not only by the hope of physical or mental cure, but by the prospect of some degree of home life, self-government, and self-development. The committee discard the idea of military discipline and propose that the men shall form a committee among themselves to cooperate in the management of the place and help to evolve the necessary rules and regulations. Not only will curative treatment and training be given, but the social and industrial aspects of the settlement will be studied and some system for the fair production and distribution of goods thought out and applied.

The village settlement will serve two purposes. It will be a healing and training center, from which many hundreds of disabled men will pass every year restored to health and vigor and ready to contribute to the coming colonization of the home country or to practice the craft or art for which they will have been newly trained. It should also naturally become the nucleus of something more lasting, for it is proposed that little by little selected men shall settle with their families on the particular estate, there forming the basis of a permanent village settlement, with its own life and industries, institutions, and interests.

Some of the details of the scheme may be given.

Site and size of the settlement.—From the medical point of view it is essential that all the circumstances and surroundings of the settlement, such as situation and climate, shall favor health. Town areas are therefore undesirable, as also flat or damp country. For the best results surroundings of natural beauty and tranquility are necessary. If it proves most desirable to settle near an existing town these features must still be secured. In any case fertility of soil and convenience of transport must be regarded, together with ready opportunity for public service of water, electricity, and the like.

The committee strongly wish, if possible, to begin with an area of 1 square mile (640 acres), suitable for a training center of, say, 1,000 disabled men at a time, that being an economical medical unit. Of these, perhaps two-thirds will study agriculture and allied subjects, the rest handicrafts and business subjects. A certain proportion as they pass through will become desirous of settling permanently on the land or in villages with their families, and ultimately it is hoped that about 200 ex-service men may make their homes on the estate.

Types of disablement suitable to the scheme.—The types of case most likely to benefit by such a scheme of combined treatment and training are: (1) A large number of men suffering from shell shock, neurasthenia, and depression, for whom the encouraging and homelike influences of such a settlement are more suited than institutional treatment; (2) men crippled by wounds or by stiff or wasted joints or muscles; (3) men who have suffered amputation; (4) certain cases recovering from malaria or other

fevers and delicate men for whom a country life is prescribed. Incurable cases—that is to say, men who can not reasonably be expected to recover any real capacity for work—will not be received, nor those who still require surgical aid or residence in hospitals. The cases to be selected for the settlement will belong to the category of outpatients. Much importance is attached to the mixture of all kinds of curable disability and disablement. The patients will not be arranged in groups according to the form of disability from which they suffer, e. g., (1) mental shock, (2) neurasthenia, (3) paralysis, (4) amputation, (5) wounded limbs, and so on, but will live, work, and be treated together, the more severe with the slighter cases. In this way the intensive effects of gathering together numbers of men suffering from a particular form of abnormality may be avoided. The committee have the support of eminent authority in believing that aggregation of many cases of the same malady may prove as injurious in mental and nervous disorders as in infective illnesses.

Principles of employment.—The three main considerations are: (1) Medical, (2) the man's natural tastes and abilities, (3) the likelihood of financial success. Upon arrival each man should go before a committee consisting of experts in (1) orthopedics, neurasthenia, and general medicine, (2) education, (3) technical education, (4) industry and employment, who should give him their best advice upon the selection of an occupation. Each case must be considered upon its own merits, so that as far as possible some work may be found for every man which will aid his physical cure, soothe and occupy his mind, and bring out his latent talents, and provide a safe investment for the future. The medical man in charge will take periodical measurements and records of the patient's muscular power and movement, fatigability, and general progress.

The present sincere desire for industrial reform, widely and deeply felt, suggests that some experiments in this direction might be tried which would be of value in the future. The conditions for such experiments are good, as the men are not able-bodied, and therefore at first business principles are not strictly applicable, although economic soundness must be an aim and should be a natural result.

Factories will doubtless remain in certain industries. But there is a growing reaction against the universal recourse to the factory system, with its specialization of labor, speeding up, and lack of personal relationships. There is in many quarters a desire to return to a modified form of the old craft guilds, in which a man may learn to create articles for use of a high standard and himself become a master craftsman, not wholly spending his life in performing some mechanical and deadening process. The workshops of the proposed settlement must aim at high conditions of work, whereby articles are well and heartily made, and to attain this it seems desirable that the producers shall have some share and interest in the things which they have produced, associated, as far as possible, in self-governing workshops.

Administration.—One of the most important features of the scheme is the home life within it. It is believed that many men, if they could have their wives and children living with them, would happily settle down to a prolonged period of training, extending over months or even years. The suggestion, therefore, is that cottages should be provided as homes for these families. Any patient during his course would be free to apply to the committee for the use of a cottage for himself and his family, and it might well be that the privilege of occupying one of these could be dependent upon good work and good conduct, as well as upon suitability. Some of the families would only be there for a time; others would stay permanently and form the nucleus of a new village. In either case the presence of home life within the training center would be a strength to it in many ways.

It is proposed that compulsory and harassing regulations should be absent from the settlement and that the men themselves should be represented in its administration and direction.

PRICES AND COST OF LIVING.

RETAIL PRICES OF FOOD AND COAL IN THE UNITED STATES.

According to reports received from retail dealers by the Bureau of Labor Statistics, retail prices of food for the United States for January 15, 1918, show an increase of 2 per cent as compared with December 15, 1917.

Relative prices are shown for 16 articles only in this report. The year 1913 is used as the basis for comparison. No prices were secured by the bureau at that time for the following articles: Chuck roast, plate beef, salmon, cheese, rice, onions, beans, prunes, raisins, coffee, and tea. Average prices of these articles are shown for December, 1917, and for January of each year from 1914 to 1918, inclusive.

Four of the 16 articles show a decrease in price, flour of 2 per cent, lard, bacon, and corn meal of 1 per cent, each. Hens show the greatest increase, or 8 per cent. Eggs and potatoes increased 6 per cent each; butter 4 per cent; and milk 3 per cent. Sirloin steak, round steak, and rib roast show an increase of 2 per cent. Pork chops, ham, and sugar increased 1 per cent each. The price of bread remained the same.

The following table shows the course of prices in the United States in December, 1917, and January, 1918:

AVERAGE MONEY RETAIL PRICES AND RELATIVE RETAIL PRICES OF FOOD ON
DEC. 15, 1917, AND JAN. 15, 1918.

[The relative price shows the per cent that the average price on the 15th of each month was of the average price for the year 1913.]

¹ 16 ounces, weight of dough.

In the year from January 15, 1917, to January 15, 1918, the price of food as a whole increased 25 per cent. All articles show decided increases, with the exception of potatoes, which decreased 16 per cent. Corn meal shows the greatest price change, an increase of 77 per cent. Bacon increased 64 per cent, lard 53 per cent, pork chops 44 per cent, ham 42 per cent, milk 35 per cent, hens 29 per cent, butter 25 per cent, eggs 23 per cent, bread 19 per cent, sugar 18 per cent, and flour 17 per cent.

A comparison of prices as between January, 1913, and January, 1918, shows that corn meal increased 135 per cent, lard 114 per cent, potatoes 107 per cent, flour 100 per cent, bacon 91 per cent, pork chops 83 per cent, eggs 81 per cent, bread 66 per cent, sugar 63 per cent, hens 62 per cent, and milk 51 per cent. Food as a whole advanced 63 per cent.

January, 1915, only, shows a decrease in the price of food as a whole in comparison with the same month in a preceding year.

A table showing the average and relative retail prices of food in the United States on January 15 of each year, 1913 to 1918, inclusive, follows:

AVERAGE MONEY PRICES AND RELATIVE RETAIL PRICES OF FOOD ON JANUARY 15 OF EACH YEAR, 1913 TO 1918, INCLUSIVE.

[The relative price shows the per cent that the average price on the 15th of each month was of the average price for the year 1913.]

1 Loaf; 16 ounces, weight of dough.

The two tables which follow give average retail prices for 29 articles in 44 cities.

For 15 cities, average prices are shown for December 15, 1917, and for January 15, 1913, 1914, 1917, and 1918. Prices are not shown for Atlanta Ga., as less than 80 per cent of the meat and grocery firms of that city sent in their reports to the bureau.

For 29 cities, average prices are given for January 15, 1918.

AVERAGE RETAIL PRICES OF THE PRINCIPAL ARTICLES OF FOOD FOR 15 SELECTED CITIES FOR JAN. 15, 1913, 1914, 1917, AND DEC. 15, 1917.
 [The average prices shown below are computed from reports sent monthly to the bureau by retail dealers. As some dealers occasionally fail to report, the number of quotations varies from month to month.]

PRICE CHANGES, WHOLESALE AND RETAIL, IN THE UNITED STATES.

A comparison of wholesale and retail price changes among important food articles in recent months, made by the Bureau of Labor Statistics of the United States Department of Labor, shows that the rise has been more pronounced for wholesale than for retail prices. This accords with the well-established principle that wholesale prices are more sensitive and respond more quickly to change-producing influences than retail prices. In collecting data for the comparison it was found that in some instances slight differences of grade or quality existed between the articles for which wholesale prices were obtainable and those for which retail prices could be secured. It was found impracticable, also, in most instances to obtain both kinds of quotations for the same date. The retail prices shown are uniformly those prevailing on the 15th of the month, while the wholesale prices are for a variable date, usually several days in advance of the 15th. For these reasons exact comparison of retail with wholesale prices can not be made. The figures are believed to be of interest, however, in contrasting price variations in the retail with those in the wholesale markets.

In the table which follows the wholesale price is in each case the mean of the high and the low quotations on the date selected, as published in leading trade journals, while the retail price is the average of all prices reported directly to the bureau by retailers for the article and city in question. The initials W. and R. are used to designate wholesale and retail prices, respectively.

WHOLESALE AND RETAIL PRICES OF IMPORTANT FOOD ARTICLES IN SELECTED CITIES.

[The initials W = wholesale; R = retail.]

Beginning in January, 1918, War Standard flour.

Wholesale and retail prices, expressed as percentages of the average money prices for 1913, are contained in the table which follows. A few articles included in the preceding table are omitted from this one, owing to lack of satisfactory data for 1913. It will be seen from the table that since the beginning of 1917 the retail prices of most of the commodities included in the exhibit have fluctuated at a lower percentage level, as compared with their 1913 base, than have the wholesale prices. This is particularly noticeable in the case of pork, bacon, lard, dressed lamb, butter, milk, eggs, flour, corn meal, and potatoes. For corn meal, especially, there has been a much smaller percentage of increase in the retail than in the wholesale price. Comparing January, 1918, prices with the average for 1913, it is seen that only 4 articles of the 28 included in the table show a larger per cent of increase in the retail than in the wholesale price. These are beef in Chicago (three price series) and granulated sugar in New York. In most of the months of 1917 the retail prices of these articles were relatively lower than were the wholesale prices.

While the percentage of increase in retail prices was less than that in wholesale prices for most of the articles, it should be noted that a comparison of the actual prices shown in the preceding table indicates that in the majority of cases the margin between the wholesale and the retail price in January, 1918, was considerably greater than in 1913. The following table shows, for example, that the wholesale price of bacon increased 137 per cent between 1913 and January, 1918, while the retail price increased only 69 per cent during the same period. The preceding table shows, however, that the difference between the wholesale price and the retail price of bacon was 16.7 cents per pound in 1913 and 19.7 cents per pound in January, 1918, thus allowing the retailer 3 cents per pound more at the latter date for the part he took in the distribution.

COST OF LIVING IN THE PHILADELPHIA SHIPBUILDING DISTRICT.

The following table shows the summary results of an investigation just made by the Bureau of Labor Statistics in cooperation with the Shipbuilding Wage Adjustment Board of the Emergency Fleet Corporation into the cost of living in the Philadelphia shipbuilding district.

Schedules covering in detail the income and expenditure for the year 1917 of 512 families were secured through personal visits of the agents of the Bureau of Labor Statistics to the homes of families of workers in shipbuilding establishments and others in the localities in which shipbuilding workers reside.

The second column of the table shows the average expenditures per family for the year 1917 for each of the principal items that enter into the cost of living. The third column shows in the form of percentages the proportion of the total amount expended for each item. The last column shows the average percentage of increase in the different items of expenditure of these families from 1914 to 1917. The total increase is a weighted average obtained by multiplying the percentage of increase in the retail prices from 1914 to 1917 by the percentage of expenditure item by item in 1917.

Information as to the increase in the retail prices from 1914 to 1917 of each of the various items of cost of living was obtained, by personal visits of the agents of the Bureau, from retail dealers patronized by workers in the same localities.

AVERAGE EXPENDITURE OF 512 FAMILIES IN PHILADELPHIA SHIPBUILDING DISTRICT IN 1917, FOR EACH OF THE PRINCIPAL ITEMS OF COST OF LIVING, PER CENT OF AVERAGE TOTAL EXPENDITURE, AND PER CENT OF INCREASE FROM 1914 TO 1917.

Items of expenditure.	Expenditures per family in 1917.		Per cent of increase from 1914 to 1917.

WHOLESALE PRICES IN THE UNITED STATES AND FOREIGN COUNTRIES, 1890 TO 1917.

In the following table the more important index numbers of wholesale prices in the United States and several foreign countries, as compiled by recognized authorities, have been reduced to a common base in order that the trend of prices as shown by these index numbers

may be compared. The results here shown have been obtained by merely shifting the base for each series of index numbers to the year 1913—i. e., by dividing the index for 1913 on the original base into the index for each year or month on that base. These results are therefore to be regarded only as approximations of the correct index numbers for series constructed by averaging the relative prices of individual commodities. This applies to the index numbers of the *Annalist*, *Gibson*, the *Economist*, *Sauerbeck*, and the Department of Labor of Canada. The index numbers of the Bureau of Labor Statistics, *Bradstreet*, *Dun*, and the Bureau of Census and Statistics of Australia are built on aggregates of actual money prices, or relatives made from such aggregates of actual prices.

WHOLESALE PRICES IN THE UNITED STATES AND CERTAIN FOREIGN COUNTRIES.

Year and month.	Index numbers expressed as percentages of the index number for 1913.								
	United States.					United Kingdom.		Canada.	Australia.

¹ Average for January and July.² Quarter beginning in specified month.

PRICES IN CANADA DURING 1917.

The January, 1918, issue of the Labor Gazette, published by the Canadian Department of Labor, in giving a résumé of prices during 1917, includes a table showing the index numbers of wholesale prices of 19 commodity groups for specified months in 1914, 1915, 1916, and for each month in 1917, the average prices for 1890 to 1899 being taken as the base, or 100; also a table showing the cost per week of a family budget of staple foods, fuel and lighting, and rent in terms of the average price in 60 cities in Canada, covering the same period. The following are the index numbers for the 19 commodity groups in January of each year and in December, 1917:

INDEX NUMBERS OF WHOLESALE PRICES, BY GROUPS OF COMMODITIES, IN
JANUARY, 1914, 1915, 1916, AND 1917, AND DECEMBER, 1917.

[1890 to 1899=100.]

Commodity group.	Index number in January—				Index number in December, 1917.
	1914	1915	1916	1917	
Grains and fodder.....	140.9	191.7	181.0	258.7	314.1
Animals and meats.....	194.2	177.9	196.3	249.2	311.8

Miscellaneous building materials.....	114.0	108.2	132.4	179.6	209.1
Paints, oils, and glass.....	140.2	142.9	193.9	213.0	261.2
House furnishings.....	128.8	131.9	146.7	168.9	208.1
Drugs and chemicals.....	111.1	135.0	250.4	236.7	276.1
Raw furs.....	226.5	121.8	260.6	399.5	465.4
Liquors and tobacco.....	138.8	137.9	136.7	167.2	186.5
Sundries.....	109.3	113.6	135.1	155.5	196.8
All commodities.....	136.5	138.9	172.1	208.1	253.5

The changes in the weekly cost of a family budget from January, 1914, to December, 1917, are traced in the following table:

COST PER WEEK OF A FAMILY BUDGET OF FOOD, FUEL AND LIGHTING, AND RENT
IN JANUARY OF EACH YEAR, 1914 TO 1917, AND IN DECEMBER, 1917, IN 60 CITIES.

Item.	Cost in January—				Cost in December, 1917. ¹	Per cent of increase December, 1917, over January, 1914.
	1914	1915	1916	1917		
Foods.....	\$7.73	\$7.97	\$8.28	\$10.27	\$12.24	58.3
Fuel and lighting.....	1.90	1.90	1.83	2.13	2.64	38.9
Rent.....	4.83	4.37	3.98	4.03	4.45	27.9
Total.....	14.46	14.24	14.11	16.43	19.33	33.7

¹ Two cities omitted.

² Decrease.

The report states that the greatest increases in the cost of foods during the year were in meats, eggs, butter, flour, beans, sugar, and potatoes.

WHOLESALE PRICE BULLETIN FOR 1916.

A study of wholesale prices during 1916, covering 342 important commodities, or series of quotations, is contained in Bulletin 226, just issued by this bureau. This report is the latest one of a series published annually since 1902. In addition to detailed data for 1916 average prices are shown for each year back to 1890. The bulletin is of especial interest as showing the changes in wholesale prices during the second year of the War, while the United States was still neutral, and because of the large amount of detailed information which it presents.

The upward movement of wholesale prices which began in the latter part of 1915 continued without interruption through the whole of 1916, becoming most pronounced in the closing months of the year. In December the weighted index number for all the articles studied stood at 118, as compared with 89 in January, indicating an average increase in wholesale prices of nearly 33 per cent, and the increase over the level of prices in December, 1914, was more than 49 per cent.

During 1916 phenomenal advances were recorded in the prices of many commodities belonging to the groups designated as farm products, food, cloths and clothing, fuel and lighting, and metals and metal products. In December as compared with January there was an increase of 30 per cent in average wholesale prices of farm products, which include many food articles in the raw state, 28 per cent in wholesale prices of food, 40 per cent in cloths and clothing, 60 per cent in fuel and lighting, and 47 per cent in metals and metal products. Drugs and chemicals, which showed a steady increase during the first five months, fell to the lowest point of the year in August and September, afterwards increasing until in December they were 2 per cent higher than in January. House-furnishing goods were 9 per cent and lumber and building materials 7 per cent higher in December than in January. The miscellaneous group, which includes such important articles as cottonseed meal and oil, lubricating oil, malt, news-print and wrapping paper, rubber, plug and smoking tobacco, whisky, and wood pulp, rose steadily in price, being 27 per cent higher in December than in January. Of 342 comparable price series secured by the bureau for 1915 and 1916, 318 showed increases in the latter year, 13 showed decreases, and 11 showed no change.

COST OF LIVING IN PORTUGAL.¹

In the current issue of the journal of the Portuguese Ministry of Labor and Social Affairs² are published for the first time (in an article under the above heading) official index numbers intended to show the manner in which the general level of household expenses has been affected by the upward movement of prices of food and certain other necessities in that country since the outbreak of the War. In Portugal questions relating to the cost of living are in charge of the Department of Economic Defense, attached to the Ministry of Labor and Social Affairs. Immediately upon its formation that department arranged to be supplied regularly each month with particulars of the retail prices of 30 commodities coming within the definitions of food, lighting, fuel, and washing materials. The department has adopted the method already employed by the official statisticians of most countries for computing changes in the general level of food prices (or in the food-purchasing power of money), viz, the method which assumes a fixed standard of family consumption and calculates the changes in the cost of maintaining that standard according to the retail prices returned as prevailing at different dates.

As the result of an inquiry into the economic conditions of the working classes, the Portuguese Ministry of Labor and Social Affairs concludes that in Portugal, in the course of a year, a working-class family of four persons consumes on an average the following quantities of the articles mentioned: Bread, 800 kilograms (1,763.7 pounds); potatoes, 250 (551.2 pounds); beef, 90 (198.4 pounds); mutton, 20 (44.1 pounds); rice, 30 (66.1 pounds); codfish, 30 (66.1 pounds); oil, 40 liters (10.6 gallons); coffee, 12 kilograms (26.5 pounds); beans and corn, 150 liters (4.3 bushels); milk, 180 liters (47.6 gallons); eggs, 40 dozen; sugar, 50 kilograms (110.2 pounds); lard or other fat, 10 (22 pounds); sausage, 12 (26.5 pounds); bacon, 12 (26.5 pounds); wine, 400 liters (105.7 gallons); coal, 500 kilograms (1,102.3 pounds); petroleum, 50 liters (13.2 gallons); and soap, 100 kilograms (220.5 pounds).

¹ The British Labour Gazette (London) for January, 1918, p. 8.

² Boletim da Previdência Social, Ano 1, April-August, 1917. Lisbon.

The general level of prices in the year 1913 in each of the two principal cities in Portugal being taken as 100, the levels prevailing in each of the first six months of 1917 are found to have been the following:

1917	Lisbon (1913=100).	Oporto (1913=100).
January.....	158.3	148.6
February.....	166.6	149.7
March.....	171.8	165.7
April.....	164.0	172.7
May.....	169.8	180.3
June.....	165.0	184.6

Taking the average of the June index numbers for Lisbon and Oporto in the above table, viz, 174.8, having ascertained by means of the inquiry already referred to that in working-class families the proportionate expenditure on each of the four groups of necessities—(a) food, (b) fuel and lighting, (c) rent, (d) clothing, and miscellaneous—is represented by the percentages 75, 10, 10, and 5, respectively, assuming further that the price of clothing has doubled since 1914, and that other classes of expenditure have remained constant, the statistician of the Portuguese Ministry of Labor and Social Affairs concludes that in June, 1917, about 66 per cent more would have had to be spent than had to be spent per month on the average in 1913 to maintain the same working-class standard of living.

WAGES AND HOURS OF LABOR.

RATES OF WAGES PAID TO WORKERS PLACED BY EMPLOYMENT OFFICES IN THE UNITED STATES, JANUARY, 1918.

In the table which follows are given the rates of wages paid to workers placed in employment by employment offices in the United States on the last day of January, 1918, or the date in January nearest the last day on which workers were placed, in 33 selected occupations. Data are presented for 122 employment offices, comprising 43 Federal employment offices, 3 Federal-municipal employment offices, 6 Federal-State employment offices, 1 Federal-State-municipal employment office, 2 Federal-State-county-municipal employment offices, 7 municipal employment offices, 1 municipal-private employment office, 41 State employment offices, 1 State-county-municipal employment office, and 17 State-municipal employment offices in 38 States and the District of Columbia.

WAGES AND THE WAR.¹

A very interesting and valuable study on wages and the War has recently appeared, the object of which is "to show the general trend in rates of compensation to the close of 1917." In order that the figures might be as authoritative as possible, the data were confined to those secured from official and other trustworthy sources, including records and reports of the various Federal and State departments, supplemented by trade and labor publications. A special effort was made to bring up to date the figures in the sources used, and to this end agents were sent to labor unions and industrial establishments and State and municipal agencies. In general the basic data have been brought up to the last month or quarter of 1917, and in some cases 1918 data have been obtained.

The following summarization is taken from the study:

THE EFFECT OF THE WAR ON WAGES.

During the past few years, and more particularly during the period of the War, there has been an increase in money wages in practically all branches of American industry. But there has been absolutely no uniformity in the degree of increase. In some trades there have been wage advances that a little while ago would have appeared wildly incredible. In others the advances have been very moderate, little, if any, greater than had occurred during a period of equal length in the preceding years of peace.

The great advances have taken place in those lines of industry for the products of which the War has created a special demand, such, for instance, as those of the iron and steel industry, the metal trades, coal mining, and shipbuilding. In some industries, such as printing, the War made no special demands; in still others, such as building, the War had a depressing effect. In these cases wage rates show no great upward movements, although almost everywhere there has been some advance.

Many individual workers in these trades, of course, profited by transferring themselves to shipbuilding, munitions making, and other distinctly war industries. With some crafts such a transfer is easy and profitable. Carpenters and steam fitters, for instance, can apply the skill they have developed in the building trades to almost identical work in shipbuilding. But this is not always the case. A printer or a glass blower, for instance, finds no particular demand for his special skill in the war industries. If he changes his job, it must usually be to some form of unskilled work where his craft knowledge is of little or no use. Thus, there would be no profit for him in changing to an unskilled labor status, even though the wage rates of such labor have advanced much more rapidly than the wage rates in his own trade.

It does not appear that the wage advances have been related to the matter of labor organization. The three industries in which perhaps the most notable advances have occurred are iron and steel, bituminous mining, and shipbuilding. The first of these—iron and steel—is almost wholly unorganized. The second—bituminous coal mining—is strongly unionized. The third—shipbuilding—is partly organized and partly unorganized.

¹ Wages and the War: A summary of recent wage movements, by Hugh S. Hanna and W. Jett Lauck. Cleveland, Doyle & Waltz Printing Co., 1918. 356 pp. Charts. Price, \$2.

In general, however, the trades and localities which were poorly organized have shown the greatest percentage of increase in wages. This is due simply to the fact that these trades and localities were, as a rule, previously upon a much lower level of wage compensation. Unorganized labor seems more responsive to the immediate demands of the moment than is organized labor. Its wages have tended to rise more rapidly in periods of business activity and to sink more rapidly in periods of business depression.

THE TREND OF WAGES IN DIFFERENT INDUSTRIES.

It is difficult to show in summary form the recent changes in wage rates that have occurred for all of the trades and occupations covered by this study. A very complete idea, however, of the changes which have taken place is offered in the accompanying tables. The first table shows the relative wages and earnings for a large number of typical occupations and industries in December, 1917 (or January, 1918), as compared with 1911-12, the earlier period being taken as 100. The second table shows the relatives for December, 1917 (or January, 1918), as compared with 1914-15. In each table the per cent of increase in 1917 over the earlier period can be readily seen by deducting 100 from the figures shown. Certain trades are included in the second table which could not be included in the first table because data were lacking for the 1911-12 period.

These tables bring out more clearly than could many pages of text the differing degrees of change which have occurred in the wages of different trades and occupations. All of the entries are for money rates of pay—per hour, day, or piece—except in the cases marked "earnings." Here the entries show changes in earnings, not rates, and earnings, of course, are not strictly comparable with wage rates, as the former are influenced by the amount of time worked.

EFFECT OF THE EIGHT-HOUR LAW UPON WAGES AND HOURS OF RAILROAD EMPLOYEES.

On August 29, 1916, in an address to Congress, President Wilson recommended, among other things, the establishment of an eight-hour day as the legal basis of work and wages alike in the employment of railroad employees actually engaged in the work of operating trains in interstate transportation and the authorization of the appointment by him of a commission of three men "to observe actual results in experience of the adoption of the eight-hour day in railway transportation alike for the men and for the railroads; its effects in the matter of operating costs, in the application of the existing practices and agreements to the new conditions, and in all other practical aspects, with the provision that the investigators shall report their conclusions to the Congress at the earliest possible date, but without

recommendation as to legislative action, in order that the public may learn from an unprejudiced source just what actual developments have ensued." This appearance of the President before Congress was actuated by failure of an effort on his part to effect an agreement between the national conference committee of the railways, representing more than 90 per cent of the business done by the railroads in the United States, and the railroad brotherhoods,¹ and thus avert a general strike threatened by the employees because certain demands as to wages and hours of labor had been definitely rejected by the railroads and efforts to bring the differences to arbitration had been futile. Congress acceded to the President's suggestion and passed the so-called eight-hour law, which was approved by the President on September 3 and 5, 1916. On October 11, 1916, the commission which Congress had authorized was appointed by the President. The members were George W. Goethals, chairman, E. E. Clark, and George Rublee. The commission entered upon its duties in November. With the cooperation of the railroads and the brotherhoods a large mass of data was collected and has been brought together in the report of the commission submitted to Congress and the President under date of December 29, 1917.²

At the outset attention is called to the fact that section 2 of the law directs the commission to report the operation and effects of the institution of the eight-hour standard workday and the facts and conditions affecting the relations between common carriers and employees, but feeling that this language was broad enough "to authorize an encyclopedia on railroad labor," the commission decided to restrict its work somewhat and deal only with topics connected with the proposal to insert an eight-hour basic day in the wage schedules as the time measure of a day's work, and with topics connected with the proposal of the roads.

This indicated that there should be shown the increase in wages resulting from the law, as well as the actual hours and wages paid, by classes of service and occupations; the relation of "straight" time and overtime payments and arbitrary allowances; a description of the leading features of the wage schedules; the conditions of train operation which result in overtime, and the possibility of eliminating those conditions; and, finally, a description of the conditions under which train and engine crews work. This view of the scope of the commission's duties eliminates the question of the reasonableness of the present wages of train or engine crews, as well as the question of the financial condition of carriers as bearing upon their ability to pay an increase. These excluded questions it did not seem possible to deal with adequately.

¹ The Brotherhood of Locomotive Engineers, the Brotherhood of Locomotive Firemen and Enginemen, the Order of Railway Conductors, and the Brotherhood of Railroad Trainmen.

² Report of the Eight-Hour Commission. Commission on standard workday of railroad employees, created by act of Congress approved Sept. 3 and 5, 1916, 39 Stat. L., p. 721, sec. 2. Washington, 1918, 503 pp.

The report states that the eight-hour day as the measure of a day's work for the purpose of reckoning compensation for certain classes of railroad employees has become an accomplished fact and that it is understood that the roads have no intention of further contesting the establishment of the eight-hour day for the employees concerned. It appears that in the calendar year 1916 there were 308,373 employees—engineers, firemen, conductors, assistant conductors, baggage men, brakemen, and flagmen in road and yard service, and generally hostlers—who were affected by the eight-hour law, this number representing 17.37 per cent of the total number of railroad employees. The aggregate compensation paid to these employees was \$410,743,044 or 28.11 per cent of the compensation paid to all railroad employees.

In giving the increase in the cost to the railroads due to the eight-hour law, the commission presents a table showing that during the month of January, 1917, companies operating 104,355 miles of road paid out on account of their passenger, freight, and yard services wages amounting to an increase of \$2,209,000 (15.17 per cent) over the compensation paid under the 1916 schedules and then estimates that if the percentage indicated were applied to the total compensation paid to these same classes of employees in 1916 the total increase in wage cost would be \$61,534,532.¹ Employees in the yard service received approximately 24.6 per cent increase in wages; those in the freight service about 15 per cent increase; and those in the passenger service about 2.7 per cent increase.

This showing for the first month of 1917, however, is subject to some modification, for the report states that in yard service there has been a widespread change to eight-hour shifts, and reduction in hours does not mean that the men get the increase noted above; they may even experience a decrease, because where they formerly worked 12 hours on a 10-hour basis they are now working 8 hours for the former 10 hours' pay. Reports covering 175,744 miles of road showed that 11,390 yard crews were placed on 8-hour shifts, and that at the time of the reports 3,486 crews were still working more than 8 hours. This reduction in hours, it is pointed out, does not mean an escape by the carriers from all the increased costs shown in January, for with 24.6 per cent increase in pay per hour the total labor cost must be increased unless the total number of man hours required for a given amount of switching is reduced through increased efficiency.

With regard to the employees, a special study of 69,202 employees in 13 occupations on 64 roads showed that 12.6 per cent received no increase in January, 1917, as a result of the law, and 30.2 per cent

¹ It is stated that this does not include the increase paid to hostlers, which would add about \$1,875,000 to this amount.

received increases of less than \$10 per month, while 23.4 per cent received increases of \$20 and under \$30 per month. Data covering engineers on certain selected roads show that during the months of January, March, and May, 1917, the greatest increases were in the yard service and the smallest were in the through passenger service.

In the report it is explained, in connection with a discussion of overtime payments and additional allowances under the eight-hour law, that the eight-hour standard which is being observed in road service is the so-called speed basis of 12.5 miles per hour. This means, for example, that for a run of 100 miles overtime begins after 8 hours have elapsed and for a run of 125 miles overtime will begin at the expiration of 10 hours, 10 being the quotient of 125 divided by 12.5. The effect of the law as applied, it is stated, is normally to leave the compensation for "straight" mileage (that is, all mileage paid for at the mileage rate) or "straight" time (that is, number of hours which constitute a day) unchanged, the same payment now being made for a normal day of 8 hours as was formerly made for a normal day of 10 hours. The mileage rate remains unchanged while the rate per hour is increased. Thus the increase in pay which the observance of the law brings to employees is chiefly in the form of payment for more hours of overtime at an increased rate per hour. This is shown by the statement that for 29,608 employees of a certain railroad, in January, 1917, the "straight" payments for miles, hours, or trips aggregated \$2,624,078 under the 1916 schedules, and \$2,622,267 under the eight-hour law, or substantially the same. The increase in compensation appears in the overtime payments, being for this road \$321,420 under the 1916 schedules and \$857,661 under the eight-hour law, an increase of \$536,241, or 166.8 per cent.

The average hours of service were found to be shortest in the through passenger service, ranging, on selected roads, from 5.4 to 10.4 per run; and that on the eastern roads, for example, in slow freight service the actual time during which engineers are on duty is from 11.7 to 13 hours per run. In local freight service men work from 11.2 to 12.6 hours per run in all districts.

Several special studies and reports were made under the direction of the commission, the subjects being railway wage schedules and agreements, employment conditions in road and yard service, and the practicability of an actual eight-hour day in railroad train service.

WAGE SCALE FOR ALABAMA COAL MINERS.

In the December issue of the MONTHLY REVIEW (pp. 110 and 111) attention was directed to an order issued by the President on October 27, 1917, granting an increase of 45 cents per ton over the scale of

prices for bituminous coal at the mine, as prescribed in the Executive order of August 21, 1917, this increase being authorized in connection with increases of wages of miners as set forth in an agreement entered into at Washington on October 6, 1917, between the operators and miners of the central field, by which an advance of 10 cents per ton was granted to miners, advances ranging from 75 cents to \$1.40 a day were granted to laborers, and an advance of 15 cents was granted for yardage and day workers.

It appears, however, that in Alabama the conditions affecting the industry are different from those in other mining fields, leading the operators and miners to reach an agreement, having the approval of the United States Fuel Administrator, as the result of which a special wage scale will prevail in that territory. This agreement, according to the Fuel Administrator, marks the settlement of a labor controversy which had been in progress for several months and which threatened to interfere with the operation of the mines. An order issued by the Fuel Administrator on February 8 specifies that the allowance of 45 cents per ton to operators, as provided in the Washington agreement of October 6, 1917, shall not apply to Alabama. The order is as follows:

An agreement having been reached by the mine operators of the State of Alabama and the mine workers of Alabama, whereby a scale of wages for miners which is satisfactory to both the operators and miners committee, and the same having been approved by the United States Fuel Administrator; and it having been further mutually agreed between the mine operators and the State of Alabama and the mine workers of Alabama that the above wage agreement modifies the Washington wage agreement of October 6, 1917, in so far as the operators and miners of the State of Alabama are concerned;

The United States Fuel Administrator, acting under authority of an Executive order of the President of the United States dated August 23, 1917, appointing said Administrator, and in furtherance of the purpose of said order and of the act of Congress therein referred to and approved August 10, 1917,

Hereby orders and directs that the terms of the Washington wage agreement of October 6, 1917, and of the orders of the President of the United States and the United States Fuel Administrator of October 27, 1917, allowing 45 cents to be added, until further notice, to the selling prices established by the President, shall not apply to any coal-mining operations whatsoever in the State of Alabama.

The labor controversy, to which reference has been made, threatened serious complications and was settled only after a conference between representatives of the miners and operators and the Fuel Administrator, which resulted in the submission, on December 14, 1917, of recommendations by the Fuel Administrator to the miners' convention at Birmingham, the adoption of the recommendations by the convention on December 21, and the order issued by the Fuel Administrator on January 12, 1918, calling upon the operators to accept without delay the decision of the Administrator.

The salient features of the settlement plan are set forth in the following abridged communication from the Fuel Administrator to the mine workers of Alabama:

* * * the United States Fuel Administrator recommends the following settlement of matters in dispute:

First. That the coal operators of Alabama recognize the right of their employees to join any union, labor organization, or society they may choose, and agree that they shall not be discriminated against in the distribution of work for having joined such organization, providing always that in their affiliation and in the conduct of the organization nothing is done to disturb the relations existing between employer and employee by methods or intimidation or coercion, and provided that employees joining any organization recognize the right of each employee to join or not as he may individually decide, and also recognize the right of the company to insist that no employee shall use the company's time for any purpose other than that for which he is paid and that he must not interfere with the operation of the mine or knowingly do that which will reduce the output.

Second. That they will, upon application through the usual channels for employment, reemploy any man who has been discharged because of his affiliation with the union, but will not obligate themselves to reemploy any man who has made unlawful threats or committed unlawful acts, unless the employer is satisfied that the same acts will not again be committed by the applicant.

Any dispute under this clause shall be referred to the person whose appointment is hereinafter provided for as the permanent umpire, to whom all questions of dispute, as herein provided, shall be referred.¹

Third. The right of the men to meet in peaceful assemblage shall not be interfered with or abridged.

Fourth. That the managers receive committees of their workmen, said committees to be selected at meetings called for the purpose not oftener than every three months, to present any grievance, disagreement, or dispute that they may have to submit, which shall not be any matter herein settled, waived, rejected or postponed. If they fail to arrive at satisfactory adjustment with the superintendent, of matters complained of, the same are to be submitted to the highest official of the company available, who shall pass upon the question within a period of 10 days. Should the matter complained of not be adjusted satisfactory to the committee, then either the committee or the company may appeal to the permanent umpire herein provided for, whose decision shall be made within 30 days and be final and binding upon all parties.

* * *

Sixth. A checkweighman selected as required by law from among mine workers employed at the mine may be placed on each tippie at the expense of the miners and his duties shall be those prescribed by the laws of the State. * * *

Seventh. In view of the fact that a large proportion of the coal produced in Alabama is sold under contracts that do not expire until July 1, 1918, the consideration of the following matters, namely, the uniform readjustment of tonnage and yardage rates, all day labor and dead work rates, the increase or decrease of the existing wage rates, it is agreed shall be postponed until July 1, 1918. * * *

Ninth. This understanding shall be in effect and binding upon the coal operators and mine workers during the continuation of the war, and not to exceed two years from April 1, 1918.

Tenth. The semimonthly pay day shall be established at all mines. * * *

¹ During the latter part of February H. C. Selheimer, of Birmingham, was appointed umpire by United States Judge Grubb, of the Northern District of Alabama.

The operator and his superintendent and his mine foremen shall be respected in the management of the mine and the direction of the working force. The authority to hire or discharge shall be vested in the mine superintendent or mine foreman.
* * *

Provision is made for the establishment of the 8-hour work day, from 7.30 a. m. to 4 p. m., with one-half hour for lunch. The agreement contains a paragraph binding the operators and miners to accept the so-called penalty clause proposed by the Fuel Administrator as a safeguard against any suspension, by reason of labor disputes, of coal production during the war. Under this clause which has been put into every working agreement approved by the Fuel Administrator, both mine workers and operators undertake to pay a heavy penalty for each day production is curtailed through the fault of either party to the agreement.

CHANGES IN WAGE RATES IN THE DRESS AND WAIST INDUSTRY OF NEW YORK CITY.

In an article describing the recent workings of trade agreements in the women's clothing industries of New York City, published in the December, 1917, issue of the MONTHLY REVIEW, mention was made (p. 34) of the fact that conferences were being held between representatives of the Dress and Waist Makers' Union and the New York Dress and Waist Manufacturers' Association for the purpose of reaching some mutually satisfactory adjustment regarding a demand made by the workers for a general wage increase of 25 per cent.

The result of these conferences has recently been announced. It is of interest to note that this wage adjustment was arrived at by a mutual understanding between the parties themselves and without the assistance of the board of arbitration of the industry. The new wage rate went into effect on January 7, 1918.

The following table shows the new rates as well as those which were in operation prior to this year:

NEW AND OLD WAGE RATES.

UNDER THE MINISTER OF WAR IN FRANCE.¹

The Journal Officiel of January 5, 1918, publishes two decrees modifying the decrees of February 1, 1909, and providing for a reorganization of the central administrative office under the minister of war.

The decrees provide for a slight increase in the number of assistant chiefs and clerks and for the following increases in salaries: Assistant chiefs of bureaus have been advanced from 7,000 to 8,000 francs (\$1,351 to \$1,544) for the higher grades; from 6,500 to 7,000 francs (\$1,254.50 to \$1,351) for the first grade; from 6,000 to 6,500 francs (\$1,158 to \$1,254.50) for the second grade; and from 5,500 to 6,000 francs (\$1,061.50 to \$1,158) for the third grade. Principal clerks' salaries are increased on an average 1,000 francs (\$193) and other clerks' salaries by 600 francs (\$115.80) and 700 francs (\$135.10).

The salaries are to be so distributed that the average salary of the chiefs shall not exceed 9,500 francs (\$1,833.50); of the assistant chiefs, 6,500 francs (\$1,254.50); of the principal clerks, 5,000 francs (\$965); and for all other classes, 3,250 francs (\$627.25).

¹ La République Française, Paris, Jan. 6, 1916.

MINIMUM WAGE.

MINIMUM WAGE LAW OF MINNESOTA HELD CONSTITUTIONAL.

Another State is added to the growing list of those whose laws providing a minimum standard of wages for women and minors have been upheld by their courts of last resort. Eleven States had laws of this type at the beginning of 1917, and one other State enacted similar legislation during that year. The first determination of constitutionality was by the Supreme Court of Oregon, but despite the favorable action of this court both legislation and enforcement were largely at a standstill pending the determination of the appeal taken to the Supreme Court of the United States. This case was decided April 9, 1917, the result being to leave the decision of the Oregon Supreme Court unchanged. The Supreme Court was equally divided, Mr. Justice Brandeis, who had acted as an attorney for the State in upholding the law prior to his elevation to the bench, not voting (MONTHLY REVIEW, May, 1917, pp. 687, 688). Following the above the Supreme Court of Arkansas, on June 4, 1917, sustained the minimum wage law of that State (MONTHLY REVIEW, November, 1917, pp. 948, 949).

A third State, Minnesota, takes its place beside Oregon and Arkansas by a decision of its supreme court handed down December 21, 1917 (*Williams v. Evans*, 165 N. W., 495). The law of Minnesota resembles that of Oregon rather than that of Arkansas, in that its administration rests with a commission having certain discretionary powers and does not prescribe by statute the scale of wages to be paid. Two points were therefore raised against the act, one involving the power of the legislature to interfere with private contracts and the other raising the question of the delegation of legislative authority. The action originated in a motion to enjoin the enforcement of the law, and the court below issued the injunction on the ground that the statute was unconstitutional and void, overruling the demurrer of the commission holding the contrary view. The Supreme Court held, however, that "we do not look to the Constitution to find the legislative power of a State. The State legislature possesses all legislative power not withheld or forbidden by the terms of the State or Federal Constitution." The fourteenth amendment to the Federal Constitution was then discussed and numerous cases cited in which the police power of the State had been exercised to modify or restrict the liberty of contract in behalf of the general

welfare as conceived by the legislature. The court found the limits to be in arbitrary restraint as opposed to reasonable regulation, citing the decision of the Supreme Court in the *Lochner* case (198 U. S., 45, 25 Sup. Ct., 539; Bul. No. 59, p. 340).

The court decided that it had no concern with the policy or justification of such legislation, but must consider only whether there was a reasonable basis for the legislative belief that the conditions of employment were dangerous to the morals of the workers and to the health of the workers themselves and of future generations as well. Conceding that such statutes if applicable to men might not necessarily be held valid, a difference was held to exist in the case of women in the matter of their ability to secure a just wage, and furthermore in the consequences of an inadequate wage. Reference was made to the recognition of the economic facts involved by the Supreme Court of the United States in the case of *Muller v. Oregon* (208 U. S., 412, 28 Sup. Ct., 324; Bul. No. 75, p. 631), and *Muller v. Wilson* (236 U. S., 373, 35 Sup. Ct., 342; Bul. No. 189, p. 133). It was also noted that the Oregon and Arkansas laws had been upheld by the supreme courts of their respective States, as mentioned above, and the law was sustained as applicable both to women and to minors, the latter by like reasoning as for women.

As to the contention that the law was unconstitutional because it delegated legislative power to the commission, it was held that there was no such delegation, but only an authorization to determine such facts as the law itself requires to be decided before it shall take effect, saying, "The true distinction is between the delegation of power to make the law, which necessarily involves a discretion as to what it shall be, and conferring authority or discretion as to its execution, to be exercised under and in pursuance of the law. The first can not be done; to the latter no valid objection can be made." *C. M. & Z. R. R. Co. v. Commissioners of Clinton County*, 1 Ohio St., 77, quoted in *Field v. Clark*, 143 U. S., 649, 12 Sup. Ct., 495. Other cases were also cited, some of which were referred to in the discussion of a case before the Supreme Court of Wisconsin involving the same question (MONTHLY REVIEW, July, 1916, pp. 136-147; see also MONTHLY REVIEW for February, 1917, pp. 208, 209).

Other minor objections were raised relating to classification and to the powers of advisory boards. As to the former it was said that the objection was not well taken, the limitations of the Constitution being flexible enough to permit of practical application; while the latter point was not involved in the case, and the validity of these provisions could not affect the validity of the entire act. Therefore, without passing upon the specific point, the constitutionality of the law in its general purpose and method was upheld.

EMPLOYMENT AND UNEMPLOYMENT.

WORK OF PUBLIC EMPLOYMENT OFFICES IN THE UNITED STATES AND OF PROVINCIAL EMPLOYMENT OFFICES IN CANADA.

Data are presented in the following table showing the operations of the public employment offices for the month of January, 1918, and in cases where figures are available, for the corresponding month in 1917. For the United States figures are given from public employment offices in 39 States and the District of Columbia, Federal employment offices in 28 States, Federal-State employment offices in 3 States, a Federal-State-county-municipal employment office in 1 State, a Federal-municipal employment office in 1 State, State employment offices in 15 States, a State-county-municipal employment office in 1 State, State-municipal employment offices in 3 States, municipal employment offices in 8 States, and a municipal-private employment office in 1 State. Figures from two Canadian employment offices are also given.

¹ Including renewals.² Not reported.REPORT OF EMPLOYMENT EXCHANGES IN THE UNITED KINGDOM
(GREAT BRITAIN AND IRELAND) FOR FOUR WEEKS ENDING DE-
CEMBER, 7, 1917.

As reported by the British Labor Gazette of January, 1918, the total number of workpeople remaining on the register of the 385 British employment offices on December 7, 1917, was 100,901, compared with 110,091 on November 9, 1917, and with 101,206 on December 8, 1916. These figures comprise workers in professional, commercial, and clerical, as well as industrial occupations.

The operations of the employment exchanges for the four weeks are summarized as follows:

Item.	Men.	Women.	Boys.	Girls.	Total.
On registers November 9, 1917.....	30, 669	63, 247	7, 621	8, 554	110, 091
Number of individuals registered during period.....	91, 339	124, 980	20, 728	18, 603	255, 650
Total.....	122, 008	188, 227	28, 349	27, 157	365, 741
Registrations during period.....	3, 491	3, 386	406	378	7, 661
On registers December 7, 1917.....	29, 282	56, 643	7, 251	7, 725	100, 901
Vacancies notified during period.....	88, 980	57, 201	12, 140	10, 084	163, 405
Vacancies filled during period.....	53, 660	49, 795	9, 962	7, 873	121, 290
Applicants placed in other districts.....	15, 860	9, 304	1, 647	1, 181	27, 992

The average daily number of registrations and of vacancies filled for the four weeks ending December 7, 1917, is shown in the following table, together with comparative figures for the periods ending November 9, 1917, and December 8, 1916.

Department.	Average registrations per day in period ending—			Average vacancies filled per day in period ending—		
	Dec. 7, 1917.	Nov. 9, 1917.	Dec. 8, 1916.	Dec. 7, 1917.	Nov. 9, 1917.	Dec. 8, 1916.

EMPLOYMENT IN SELECTED INDUSTRIES IN JANUARY, 1918.

The Bureau of Labor Statistics received and tabulated reports concerning the volume of employment in January, 1918, from representative manufacturing establishments in 13 industries. Comparing the figures for January, 1918, with those from identical establishments for January, 1917, it appears that in 3 industries there was an increase in the number of people employed and in 10 a decrease. Cigar manufacturing shows an increase of 4.9 per cent while automobile manufacturing shows a decrease of 10.4 per cent.

Nine industries show an increase in the total amount of the pay roll for January, 1918, as compared with January, 1917. The greatest increase shown—18.3 per cent—is in woolen. Cotton manufacturing and iron and steel show increases of 17.4 and 15.2 per cent, respectively. A decrease in the total amount of the pay roll of 4 industries is shown. The greatest decrease—11.9 per cent—is in leather manufacturing; while silk shows a decrease of 5.3 per cent.

The table below shows the number of persons actually working on the last full day of the reported pay period in January, 1917, and January, 1918. The number of establishments reporting on this question is small and this fact should be taken into consideration when studying these figures.

COMPARISON OF EMPLOYMENT IN IDENTICAL ESTABLISHMENTS ON LAST FULL DAY'S OPERATION IN JANUARY, 1917, AND JANUARY, 1918.

Industry.	Establishments reporting for January both years.	Period of pay roll.	Number actually working on last full day of reported pay period in January—		Per cent of increase (+) or decrease (—).
			1917	1918	
Boots and shoes.....	20	1 week....	11,305	9,865	-12.7
Cotton manufacturing.....	29	do.....	24,064	23,695	- 1.5
Cotton finishing.....	13	do.....	10,338	10,119	- 2.1

Cigar manufacturing.....	15	1 week....	4,261	4,351	+ 2.1
Automobile manufacturing.....	24	do.....	67,070	59,594	-11.1
Leather manufacturing.....	14	do.....	10,420	9,449	- 9.3
Paper making.....	13	do.....	9,318	9,846	+ 5.7

The figures in the table below show that in 2 of the 13 industries there were more persons on the pay roll in January, 1918, than in December, 1917. Boots and shoes shows the larger increase—0.4 per cent—and car building and repairing shows an increase of 0.3 per cent. Decreases are shown in 11 industries. Men's ready-made clothing shows the greatest decrease—4.9 per cent—while woolen shows a decrease of 4.6 per cent.

All of the 13 industries reporting show decreases in the total amount of pay roll when comparing January, 1918, with December, 1917, which is doubtlessly explained by unfavorable weather conditions and a shortage of fuel experienced by many plants during the pay-roll period under consideration. In a few cases the operation of plants was hindered by labor disturbances. Automobile manufacturing and iron and steel show the greatest decreases—12.1 per cent and 11.1 per cent, respectively.

CHANGES IN WAGE RATES.

In 10 of the 13 industries there were establishments reporting increases in wage rates during the period December 15, 1917, to January 15, 1918, and in 3 industries no establishment reported a change. A number of firms did not answer the inquiry relating to

the wage-rate changes, but in such cases it is probably safe to assume that no changes were made.

Boots and shoes: The report from 1 plant showed an increase of 5 per cent to all its employees.

Cotton manufacturing: One plant reported an increase of 10 per cent to all hands except overseers.

Cotton finishing: One establishment reported an increase of 10 per cent but did not report the number of workers affected.

Hosiery and underwear: Reports from four plants showed changes in the wage rates. One plant reported a 10 per cent increase to its entire force. One plant reported an increase of 8 per cent to 90 per cent of its employees. One plant reported a "general" increase of 15 per cent, and another plant an increase of $16\frac{2}{3}$ per cent, but gave no data as to the number of employees affected.

Silk: One plant reported an increase of 10 per cent affecting its force in general, while a second reported a bonus of 10 per cent to all its force.

Men's ready-made clothing: One plant reported a 5 per cent increase in two departments.

Iron and steel: Reports from 24 plants show an increase in the wage rates. One plant reported an increase of 5 per cent to about a third of its employees. One plant reported a 4 per cent increase to about 60 per cent of its force. One plant granted an increase of 3 per cent to 40 per cent of its employees, and another plant reported a premium of slightly more than 5 per cent of total pay roll. Four plants granted an increase of 0.0188 per cent to numbers of their employees ranging from 50.7 per cent to 54.6 per cent, and 4 plants granted a 0.0254 per cent increase to 34.5 per cent, 36.2 per cent, 38.2 per cent, and 38.5 per cent, respectively. One plant reported an average increase of 5 per cent, while in another plant there was a 5 per cent increase to all employees. Reports from 5 plants showed an average increase of $5\frac{1}{2}$ per cent; 1 plant an average of 8 per cent increase, and 2 an average of 10 per cent increase. One plant reported an increase but gave no data.

Car building and repairing: One plant reported an increase of 20 per cent to $6\frac{1}{2}$ per cent of its force and an increase of 4 cents per hour to laborers, while a second plant reported an increase of 0.02 per cent, but gave no statement as to the number affected.

Automobile manufacturing: Reports from 4 establishments showed increases in the wage rates. One plant reported an increase of approximately 20 per cent to slightly more than 6 per cent of the force. One plant reported an increase of 30 cents and under per hour to 10 per cent of its employees; between 30 cents and 40 cents per hour to 7 per cent, and over 40 cents per hour to 4 per cent of

its employees. One plant granted an increase of 10 per cent to 8 per cent of its force.

Leather manufacturing: One plant reported a 10 per cent increase giving no statement as to the number affected, and another plant reported an increase of 15 cents per day per man on entire force.

VOLUME OF EMPLOYMENT IN THE UNITED KINGDOM (GREAT BRITAIN AND IRELAND) IN DECEMBER, 1917.

The table on page 159 pertaining to the condition of employment in Great Britain and Ireland was compiled from a report published in the British Labor Gazette of January, 1918.

No important changes relating to the number of employees in December, 1917 as compared with November, 1917, are shown.

Dressmaking and millinery show a decrease of 2.2 per cent; dock and riverside labor, a decrease of 3.7 per cent; seamen, a decrease of 4.4 per cent, while no other trade shows a change of as much as 2 per cent. In comparing December, 1917, with December, 1916, on this point more important changes are seen. The cotton trade shows a decrease of 11.7 per cent, dock and riverside labor a decrease of 28.3 per cent; seamen, a decrease of 18.1 per cent; food preparation, a decrease of 14.9 per cent, while all other trades show a change of less than 10 per cent each.

Earnings of employees show few important changes in December as compared with November. The cotton trade shows an increase of 11.4 per cent; hosiery, 6.6 per cent; bleaching, printing, dyeing, and finishing, 9.0 per cent, while the other trades show increases ranging below these.

In comparing December, 1917, with December, 1916, on the question of earnings of employees, more important changes are shown, all of which are increases. The tailoring trades show an increase of 41.8 per cent; linen, an increase of 40.8 per cent; brick, an increase of 29.1 per cent; jute, an increase of 24.5 per cent. Twelve trades show increases ranging from 12.8 per cent to 23.6 per cent, while the other trades reporting increases of earnings of employees show percentages ranging below 10 per cent.

VOLUME OF EMPLOYMENT IN THE UNITED KINGDOM (GREAT BRITAIN AND IRELAND) IN DECEMBER, 1917, AS COMPARED WITH NOVEMBER, 1917, AND DECEMBER, 1916.

Casual employment (men only).....	92				1,665					

¹ Occupations are grouped according to the industry with which they are mainly connected and applicants are registered according to the work desired by them.

This table shows that during the period, in the insured trades, 115,089 adults registered for work—59,528 men and 55,561 women. There were 94,011 vacancies reported—63,103 men, 25,284 women, 3,931 boys, and 1,693 girls. The number of positions filled was 72,079—41,589 men, 25,511 women, 3,465 boys, and 1,514 girls. The occupation groups in which the largest numbers of positions were

filled by adults were: Ammunition and explosives, 10,495; laborers—engineering, 9,765; metal machinists, 7,648; works of construction, 7,310; erectors, fitters, turners—engineering, 6,511; laborers—building, 4,383; and other skilled occupations—engineering, 4,379.

In the uninsured trades there were 101,230 registrations—31,811 men and 69,419 women. The number of vacancies reported was 69,394—20,877 men, 31,917 women, 8,209 boys, and 8,391 girls. The total number of positions filled was 49,211—12,071 men, 24,284 women, 6,497 boys, and 6,359 girls. The occupation groups in the uninsured trades, in which the largest numbers of positions were filled by adults were: Domestic service, 12,575; conveyance of men, goods, etc., 5,565; general laborers, 4,137; commercial and clerical, 3,954.

The total number of positions filled by adults in both the insured and uninsured trades during the four weeks ending December, 7, 1917, as compared with the preceding four weeks, shows a decrease of 5.8 per cent. The decrease in the number of positions filled by men was 2.2 per cent; by women 9.3 per cent. Much the largest number of women were employed in the manufacture of ammunition and explosives and in domestic service.

No comparison can be made of the number of registrations in the employment exchanges of Great Britain with the number of applications for work reported by the employment offices of the United States, owing to the difference in method of registering applicants. It is possible, however, to make a comparison of positions filled by the offices in the two countries. The figures show the following result:

	Number of offices.	Positions filled.		
		Total.	Average per day.	Average per day each office.
Great Britain (4 weeks ending Dec. 7, 1917)	385	121,290	5,054	13.1
United States (Nov., 1917)	161	122,610	4,904	30.5

The above figures are significant in view of the fact that a very large percentage, if not practically all, of the employment-office work of Great Britain is done through the free employment exchanges, while in the United States but a very small proportion of the placements is made through the public employment offices, the much greater proportion being handled by the private employment agencies.

WORK OF CALIFORNIA PUBLIC EMPLOYMENT BUREAUS DURING 1917.¹

For the year ending December 31, 1917, the public employment bureaus of the State of California successfully filled 92,959 positions, according to the report of John P. McLaughlin, commissioner of labor. This is an increase of 100 per cent over the 46,442 placements of 1916, which was the first year of their existence. If we include the additional 45,044 placements in Los Angeles city, the public bureaus of the State have 138,003 placements to their credit for the year just ended.

San Francisco placed 39,795, of whom 3,375 were women and 36,420 were men; 15,557 were sent outside the city and 24,238 went to work in the city proper. Of the women 1,509 were placed in hotels, apartment houses, and restaurants, 998 in private homes, 254 in factories, and 228 in clerical positions. Hotels and restaurants took 8,759 of the men, followed by transportation with 5,615, lumber and timber products with 3,231, agriculture with 1,859, and factories with 1,633.

The Oakland office placed 11,459 men and 2,755 women. Of the women 1,725 went into private homes and 636 into hotels, apartment houses, and restaurants. These same industries took 1,768 men, followed by transportation with 1,289 and agriculture with 587. Oakland, Alameda and Berkeley accounted for 12,291 of the total, the balance of 1,923 going to outside points.

Sacramento's total of 11,313 comprised 10,879 men and 434 women. Of the women 291 went into private homes and 99 into hotels, etc. Agriculture accounted for 3,253 of the men, followed by the lumber industry with 1,557 and transportation with 1,505. Of the total positions furnished 3,079 were in Sacramento and 8,234 were outside the city.

The Fresno office was in operation only a little over four months and placed 6,999 persons, of which number the women constituted 289. Fresno city took 1,895 and the surrounding country 5,104. Agriculture took 171 of the women, hotels 67, and private homes 47. Of the 6,710 men, 3,307 were placed in agriculture, followed by the lumber industry with 668 and building construction with 623.

The State placed 20,638 in the eight southern counties outside of Los Angeles city, and 45,044 more were placed by the city of Los Angeles, with whom the State is cooperating. Of this number 4,050 were placed in agricultural pursuits.

Of the immense total of over 138,003 positions mentioned above, 13,425, or less than 10 per cent, were placed in agricultural pursuits,

¹ This advance summary of the activities of the California public employment bureaus was furnished the Bureau of Labor Statistics by C. B. Sexton, superintendent of bureaus, 933 Mission Street, San Francisco.

where the demand for labor has been greatest. The reason for this is largely because our bureaus have been situated too far from the farming communities to be of much relief to them. By cities, the percentages agricultural are of total placements run as follows: Oakland 4 per cent; San Francisco 5 per cent; Los Angeles 6 per cent; Sacramento 30 per cent, and Fresno 50 per cent. In other words, the nearer we get to the farming community the more assistance we are to them. The need of more offices was repeatedly called attention to, and at the last session of the legislature the labor commissioner asked for an appropriation of \$50,000 yearly for the purpose of opening some new branches, but his recommendation was not heeded and a merely nominal increase was given the department. As soon as the extra money was available Gov. Stephens immediately authorized the opening of the Fresno office, which was a great factor in supplying help to harvest the largest raisin-grape crop on record.

Placements in Sacramento and Fresno cost about 40 cents per person, as against an average of \$1.80 charged by private fee agencies. Offices at such centers as Stockton, San Jose, and other places in the farming communities of the State, would go a long way toward getting help to put this year's crops in the barns and warehouses. Such offices could be conducted for seven months of the year at a cost of not over \$3,000 each, including equipment.

It might be pertinent at this time to once more draw attention to the need of a reduced rate for farm workers who have to travel any appreciable distance. The need will be more urgent than ever this summer, and the chance of the request being granted should be greater on account of the taking over of the railroads by the Federal Government. The farmers, when labor is most needed, have always to compete with employers who offer free or advanced fares. Of the 8,589 men furnished to the transportation companies, all were given free fare, and the fare was advanced to practically all of the 6,099 men taken by the lumber companies, besides hundreds of men furnished to large contractors. Even with an equal offer in wages the farmer is practically in a losing position as against the railroad companies, lumber interests, and contractors in such cases.

EMPLOYMENT IN THE STATE OF NEW YORK.

The following statement regarding the labor market in New York in January is made by the Bureau of Employment of the New York State Industrial Commission under date of February 1, 1918:

The statistics of all the employment offices in the State Bureau of Employment for the past month show that there has been a very slight increase in the work during

the month of January over that of December, 1917. It will be noted that the work of the offices in all lines almost exactly parallels the work done one year ago in the month of January, 1917. During the past month all the registration offices have kept account of the number of people who come to the offices seeking work. The total is a little over 30,000. The 8,000 registrations represent the workers actually handled and sent to positions. For the other 20,000 or more the offices did not have positions, and on account of limited clerical force they were not registered.

There is undoubtedly a considerable amount of unemployment in the State of New York as a whole, due to a number of causes. Some plants are finding difficulty in obtaining raw material, others in obtaining fuel. There has been a decreased demand on the part of the public for articles classed as luxuries. This automatically necessitates a reduction in the force of many plants, and in a few cases to an entire shutdown. It might have been expected that this supply of labor would be absorbed in the various lines of war work. But owing to the fact that many of the war contractors have not yet reached their maximum capacity this supply of labor has not been taken on.

Reports indicate that the five-day closing order did not materially increase the present very large "turnover." This "turnover" still continues and is due to the restlessness occasioned by the reports of labor shortage and high wages, which reports still persist. Alleged shortage often means that certain industries are still calling for highly skilled men in various occupations. This once more strongly emphasizes the necessity for some rational and efficient method of training the less skilled workers for the more highly technical needs.

In spite of the adverse weather the subject of farm help is demanding attention. The State Food Commission should have, just now, some specially organized machinery for the handling of farm help. The work should be carried on through the State Employment Bureau, but will necessitate a very large temporary increase in the present staff of workers. The prospect of securing farm hands seems much brighter than it did a few weeks ago. Among the men laid off for all sorts of reasons are found many who have formerly done farm work, and who now feel that industrial conditions are such as to warrant them in accepting farm wages and the surety of employment. Many have discovered, after spending much time and carfare, that the reported enormous earnings in various lines are really only made by the exceptional few. This supply of farm help just now available is one calling for the quick establishment of machinery for handling it. These men should be registered at once and brought in touch with farmers needing help. A delay of a few weeks will mean that they will probably wander into the fields of industry again opening up as the result of an increased supply of fuel and materials.

The juvenile placement departments are now organized in five offices of the bureau. During the first few weeks the staffs of these departments have mainly devoted their time to getting thoroughly acquainted with the industries and openings in their different communities. They have, however, already commenced their actual work. As has been stated before, these departments are trying to avoid making a record of placements. Reports received indicate that they are spending more time in getting children to return to school and in giving vocational advice than in making actual placements. There is a strong call for this intensive work of pointing out to young people the need of further schooling or the need of taking up special lines of training.

Regarding manufacturing activity in New York the Industrial Commission states that in December, 1917, as compared with the preceding month there were increases of almost one-half per cent in both the number of employees and the amount of wages paid, and a

new high record for wages was established. As compared with the same month in 1916 there was an almost imperceptible decrease in the number of employees in December, 1917, and a 14 per cent increase in the pay roll. A comparison of December, 1917, with December, 1915, shows increases of 13 per cent in the number of workers and 48 per cent in the total amount of wages paid to them. Since December, 1914, there was in December, 1917, an increase of 32 per cent in the number of employees and 87 per cent in the volume of wages. The leather, the metals and machinery, and the textiles groups showed the greatest increases in activity in December as compared with November.

OPERATIONS OF THE LABOR EXCHANGE SYSTEM OF NEW SOUTH WALES, 1916-17.

In the December issue of the New South Wales Industrial Gazette (pp. 776 to 786) there is a report of the operations of the labor exchange system for the financial year ending June 30, 1917, in which the record of the year's activities is first set forth, followed by a statement of the amalgamation of the State labor branch and the central labor exchange as the result of the "far-reaching plan of reorganization in this section of departmental work," which was found to be essential to meet "an industrial problem of serious dimensions" brought about by the suspension of great public works, and the partial collapse of the building industry and corresponding war effects upon a great range of individual enterprises. Mention is also made of the establishment of a daily news list, showing the work available, and the labor offerings at and through the exchanges for the information of employers and employees, respectively, under the title of the "Labor Exchange Daily Supplement to the New South Wales Industrial Gazette."

While no statistics are given showing the occupations included in the placements, it is stated that the labor exchanges applied themselves with great zest to the satisfaction of farmers' needs in connection with the 1916 harvest, and it may be assumed that a large proportion of the male labor was sent to the farms to work. The persons placed in employment by the State labor branch and the State labor exchange numbered 14,944, of whom the women's employment agency placed 3,578 (23.9 per cent), although it is not stated that women were not placed by other agencies. The total number placed was 69.2 per cent of the number of applications received from employers and 57.4 per cent of the number of applications received from employees.

A practice is made of assisting workers to the place of their employment by advances in varying amounts for traveling expenses, and during the year 4,236, or 27 per cent of those placed, availed themselves of this privilege, the total amount of the advances being £4,897 4s. 3d. (\$23,832.28), representing £1 3s. 1d. (\$5.62) per person assisted. The arrears of repayments due up to the end of the year amounted to £320 0s. 8d. (\$1,557.44), or 1s. 6d. (36.5 cents) per person. These advances have been limited to £2 (\$9.73) per person, but during the year direction was given to labor exchanges to extend this limit if necessary in order to facilitate the transfer of employees' families to the location in which work was available. Furthermore, exchanges were permitted to make an advance not to exceed £1 (\$4.87) per person, in addition to the amount advanced for fares, to meet expenses during that part of the journey which remains after an applicant reaches a railroad terminus or a railroad station or port of disembarkation nearest to his place of employment.

The report notes several matters of policy which were determined during the year, which may be suggested briefly.

The exchanges are at liberty to treat applications for employment from residents outside the State in the same manner as they treat applications for employment from residents of New South Wales, "provided that in the first place the persons to be assisted were white Australians or white New Zealanders, and in the second place that applicants for employment within the State should be able to supply a certificate indicating that the condition of their health was not likely to be a menace to the health of the people of this State, or to leave them dependent upon local charity."

Upon the question of registration a direction was issued during the year that every applicant for employment registered with the exchanges must be treated as a person available for employment unless his record with the exchange discloses otherwise at any future time.

Exchange officers were directed that they should take pains to see that the employees sent to employment were capable of satisfactorily discharging the duties which their employment would require from them, the feeling being that no system, however theoretically perfect, could succeed if the practical value of the person sent to employment was not responsibly ascertained and to some extent guaranteed.

The question of giving preference of employment to married men was determined by the minister of labor to be an unwise procedure, the view being expressed that those who preferred the request seemed to overlook the fact that the departmental labor exchanges

selected labor only in a secondary sense; that the character of labor required by employers who resorted to the exchanges was generally indicated with some particularity; that skilled workers of almost any class in mechanical trades were then difficult to find; and that the claims of unionists to preference of employment could not well be resisted by employers or the labor exchanges.

It is part of the plan of the labor-exchange system to preserve a record of the character and industrial ability of each person assisted. The purpose of the record is to make it possible for the exchanges to give assurances, based on the individual history preserved by them, as to the probity and efficiency of the persons sent by them to employment.

A question raised as to whether the exchanges should be made available to men who from their age, physical ability, and other conditions were deemed to be persons who should volunteer for military service was considered by the minister, who issued an instruction that exchange services should not be refused to any registered applicant for employment, subject always to the continuance of the departmental policy by which the patriotic obligations of persons who might be expected to enlist were to be brought vividly to their minds.

LABOR ORGANIZATIONS.

TWENTY-FIRST ANNUAL CONVENTION OF THE INTERNATIONAL SEAMEN'S UNION OF AMERICA.

The keynote of the Twenty-first Annual Convention of the International Seamen's Union of America, held at Buffalo, December 3 to 12, 1917, inclusive, was sounded in the call "to all seafaring men ashore or afloat," embodied in resolution No. 20 adopted unanimously by the convention:

The Nation that proclaimed your freedom now needs your services. America is at war. Our troops are being transported over the seas. Munitions and supplies are being shipped in ever increasing quantities to our armies in Europe. The bases are the ports of America. The battle fields are in Europe. The sea intervenes. Over it the men of the sea must sail the supply ships. A great emergency fleet is now being built. Thousands of skilled seamen, seafaring men of all capacities, who left the sea in years gone by as a protest against the serfdom from which no flag then offered relief, have now an opportunity to return to their former calling, sail as free men, and serve our country.

Your old shipmates—men who remained with the ship to win the new status for our craft—now call upon you to again stand by for duty. Your help is needed to prove that no enemy on the seas can stop the ships of the Nation whose seamen bear the responsibility of liberty.

America has the right, a far greater right than any other nation, to call upon the seamen of all the world for service. By responding to this call now you can demonstrate your practical appreciation of freedom won.

* * * We must be prepared, * * * to man the great new merchant fleet now building. Men must be ready and in training. It is in recognition of this need that we, as a duty to the Nation, submit this call to all seamen.

The Seamen's Union, which operates in three great divisions, the Pacific, Atlantic, and Lake districts, comprises a membership of about 38,000. In his report, the secretary treasurer points out the great gain in membership, increasing financial strength, marked increase in wages, and general improvement of working conditions. The report points particularly to the Eastern and Gulf Sailors' Association, which has added nearly 2,000 to its membership; to the Marine, Firemen, Oilers, and Water Tenders' Union of the Atlantic and the Gulf, which has "made greater gains during the past year than any other district union in the International," and to the Marine Cooks and Stewards' Association of the Atlantic, which has obtained wage increases ranging from 25 per cent for the most skilled men to 100 per cent for men of lesser experience, with an additional bonus of 50 per cent for men going into the war zone. Material improve-

ments in working conditions, overtime pay, and increases in wages are reported for the Maritime Union of the Pacific District, and it is further stated that the "progress made in organizing and improving conditions of men in the various fishing industries of the Pacific coast exceeded our expectations." It is reported that the Lake Seamen's Union has, "through skillful maneuvering" been able to "establish a wage scale far in excess of that contemplated by the Lake shipowners."

The year closed marked the inauguration of a number of important agreements between the union, shipowners, and the United States Shipping Board. The Atlantic agreement of May, 1917, entered into between the Union of Sailors, Firemen, and Cooks of the Atlantic District, shipowners of the Atlantic coast, and the United States Shipping Board, and approved by the Secretaries of Labor and of Commerce, is considered by the union to be the most important feature of the progress made by the seamen of America during the past year. This agreement was finally ratified on August 8, 1917, is as follows:

Substantially all the steamship lines will agree to pay the following wages: Sailors and firemen, \$60 per month; coal passers, \$50 per month; oilers and water tenders, \$65 per month; boatswains, \$70 per month; carpenters, \$75 per month; overtime pay for cargo work, 50 cents; for ship work, 40 cents per hour. Bonus going to the war zone 50 per cent of the wages, wages and bonus to continue until crew arrived back in the United States; \$100 compensation for loss of effects caused by war conditions. The scale of wages and bonus for cooks and stewards at present in force be maintained and continued during the continuance of this agreement.

That a certain number of boys determined by the number of men carried are to be employed in addition to the usual crew; that a number of ordinary seamen will be employed in proportion to the able seamen carried. Taken as an instance, a vessel now carrying 8 men on deck, will carry 6 able seamen, 2 ordinary seamen, and 2 boys, such boys and ordinary seamen to have ample opportunity to learn the work usually demanded of able seamen.

That the representatives of the organized seamen shall have access to and be permitted on docks and vessels during reasonable hours.

The representatives of the seamen tentatively agreed to join with the shipowners in an appeal to seamen now employed on shore to come back to the sea.

That the bonus and other conditions arising from the War shall terminate with the War, and that the wages set shall remain for one year to the end that wages be stabilized, and that the new men now on shore may be induced to return to the sea.

That the seamen will use earnest efforts in cooperation with the officers to teach seamanship to the boys and ordinary seamen.

The secretary treasurer recounts the plans of the Lake Seamen's Union during the past season, which included a movement for a wage increase and the abolition of the discharge-book feature of the employment system of the Lake Carriers' Association. The report states that because of the unwillingness of the Lake Carriers' Association to give up this feature of its employment system, the Lake Sea-

men's Union called a strike, which, while not actually carried out, led to a series of conferences between representatives of the seamen, the Lake Carriers' Association, and the United States Shipping Board, resulting in the establishment of a minimum-wage schedule for seamen on the Great Lakes, effective from October 1, 1917, to the close of the season, and brought about the abolition of the continuous-discharge-book system by the United States Shipping Board.

The president's report deals chiefly with his efforts to "watch legislation and general developments, * * * to defend such part of the Seamen's Act as might be attacked in the courts, to assist foreign seamen as well as members of our own organization in obtaining the benefit of the act."

Among the resolutions adopted by the convention, the subject matter of a few of the more important ones may be mentioned:

Resolution No. 2 favors a conference of all the seamen of the world, immediately upon the termination of the War, for the purpose of initiating measures deemed essential for the elimination of dissension and hatred among seamen.

Resolution No. 6 urges the Department of Commerce to have a ruling amended which makes possible the working of the crew in the engine and fire room for eight consecutive hours, which is believed to be in violation of the spirit and intention of the Seamen's Act.

Resolution No. 7 instructs the legislative committee of the union to further the passage of a bill pending in Congress designed to increase the salaries of employees of the Steamboat Inspection Service.

Resolution No. 9 points out that because of the hazardous employment in which seamen are engaged, a reduction in their hours of labor is fully warranted and favors the establishment of an eight-hour workday for all seamen.

Resolution No. 16 asks for the enactment of a law by Congress which would make it compulsory that all lake ships carry an emergency nonperishable food supply for emergency use only.

Resolution No. 19 requests that a system of training be started immediately for merchant seamen on a large scale, and that the recruiting service of the United States Shipping Board have absolute control over the recruiting and training of such seamen. As a means of more effectively carrying out this policy, a series of recommendations accompany this resolution urged for adoption by the United States Shipping Board.

The committee on legislation urges the enactment of a general Federal compensation law for all seamen, in view of the fact that there is no general law in the United States providing definite compensation for injuries received by seamen on board the vessel or in the service of the vessel.

The next convention will meet at Galveston, Tex., on the third Monday in January, 1919.

INTERNATIONAL TRADE-UNION CONFERENCE IN BERNE, OCTOBER 1
TO 4, 1917.¹

In accordance with the resolution of the preliminary conference in Stockholm on June 8, 1917, the conference of the International Federation of Trade-unions was held in Berne, Switzerland, on October 1 to 4. Originally it was proposed that the conference should meet on September 17, but in deference to the wish of the Swiss Federation, which had undertaken the organization of the conference, the date of convocation was postponed to October 1 in order to make it possible for representatives of all affiliated national federations to attend. The national organizations of Great Britain, the United States, and Belgium declined, however, to participate in the conference. The reason given by the American Federation of Labor was that at the present time a conference would not lead to any results. Belgium declined the invitation without stating any reason for doing so, and the British Federation of Trade-unions, in a letter, declined to meet in conference representatives of the German working classes. Italy and Spain sent no reply. The French Federation had announced that it would participate, but later sent a telegram, which arrived on the second day of the conference, stating that the French delegates had been refused passports by their Government.

The countries represented at the conference and the number of delegates from each were as follows: Bulgaria, 2; Denmark, 3; Germany, 10; Holland, 8; Norway, 2; Austria, 5; Sweden, 5; Switzerland, 11; and Hungary, 10. In addition there were 5 delegates of the Czecho-Slavic trade-unions of Bohemia, which are not affiliated with the International Federation. These delegates were admitted to the conference with the understanding that in questions relating to organization of the Federation they, like the Bulgarian delegates whose organization also is not at present affiliated with the federation, should have no vote.

The program of the conference was limited to the question of the transfer of the headquarters and reorganization of the International Federation and to the peace demands of the trade-unions. The conference resolved to appoint two committees for the preliminary discussion of these two questions. One representative of each affiliated national organization was elected to the committee for the preliminary discussion of the transfer of headquarters. The second committee, charged with the discussion of the peace demands, was composed of 10 members; i. e., of one representative of each delegation present at the conference.

The first two days of the conference were spent in the reading of letters and telegrams received from national organizations which had

¹ Correspondenzblatt der Generalkommission der Gewerkschaften Deutschlands, vol. 41, No. 27. Berlin, Oct. 13, 1917.

declined to attend the conference or were prevented from attending it. After a spirited debate in which these declinations were criticized, the conference adopted the following resolution:

The international conference greatly regrets that the representatives of the French trade-unions were prevented by their Government from coming to Berne.

The conference acknowledges receipt of the letter of the British General Federation in which the reasons for its failure to send delegates are given. This declination of the invitation to participate in the conference is incomprehensible to the conference because it is inconsistent with the endeavors and objects of the international labor and trade-union movement. The conference does not consider itself competent to sit in judgment on the question of the guilt of the nations and of their governments in the present War, and therefore must disregard the letter of the British General Federation and pass to the order of the day, expressing the sincere wish that in all countries the leaders and masses of the organized proletariat may with all means at their disposal work for an early conclusion of peace.

On the third day of the conference the committee for preliminary discussion of the transfer of headquarters submitted the result of its discussions. J. A. Hansen (Denmark), the spokesman of the committee, stated that the committee had arrived at the decision that "under the present circumstances transfer of the headquarters of the International Federation should not be made, because the conference is not a full conference. As the original movers of the transfer are not present, nothing would be gained by deciding this question at present, because there is no guaranty that the absent national organizations would be willing to abide by such a decision. It should, moreover, be stated explicitly that so far nobody has complained about the business management of the headquarters by the Germans."

During the subsequent long debate only the representatives of Switzerland were in favor of a transfer of headquarters, while the Hungarian representatives recommended a transfer of the secretariat to Switzerland for the duration of the War. Representatives of the Dutch and German delegations spoke against such an arrangement. When the matter came to a vote the conference approved the findings of the committee and with the Swiss delegation dissenting adopted the following resolution:

The conference is not necessarily opposed to settling of the question of the transfer of the secretariat. The circumstances, however, under which the transfer of the headquarters of the International Federation of Trade-unions has been requested, as well as the absence of the original movers of this transfer, cause the conference to defer decision of such an important question of organization and to submit it to the next conference.

In order, however, to maintain international connection among the national organizations affiliated with the federation, the conference confirms the branch office in Amsterdam and charges it with the continuance and expansion of its present intermediary activities. The conference further expects that the national organization will make the utmost efforts to the end that the differences prevailing to-day, which were only caused by the War, may be removed at the earliest possible date and unity be restored.

On the last day of the conference this resolution was supplemented by the following declaration made by the German delegation:

The representatives of the German trade-unions declare that their refusal to consent to-day to a transfer of the secretariat should not be taken to mean that they intend to keep the headquarters of the International Federation of Trade-unions in Germany under all circumstances. They are forced into their present attitude because the British trade-unions in particular have remarked that the transfer of the secretariat would be equivalent to an expression of distrust of Germany. The International Federation can be maintained only if all the national federations have complete confidence in each other. As soon as all national federations will agree to take part in a conference they will find the German trade-unions ready to discuss in an orderly manner the transfer of the secretariat of the International Federation.

The discussion of the peace demands of the International Federation showed again the complete unity of purpose of the trade-unions represented at the conference in all matters relating directly to the safeguarding of the interests of labor. After having examined the various proposals submitted and the resolutions of the Leeds conference, the committee finally adopted, with a few minor changes, the program of the international secretariat. The spokesman of the committee emphasized that, "although several proposals made by members of the committee were withdrawn or not incorporated by the committee in its program, it should not be concluded that the committee was opposed to these proposals. The committee, however, did not consider it suitable to burden the peace program, which is the international program of the trade-unions, with demands going far beyond what can actually be realized within the individual national spheres. The committee was, for instance, forced to decline a proposal of the Swiss delegates for the immediate adoption of the eight-hour-day principle and to accept in its place the Leeds conference proposal that the 10-hour day be adopted as the international maximum working day. This decision was based on the fact that a large number of countries which have no regulation at all as to hours of labor will be parties to the peace agreement. Adoption of the 10-hour day will mean a great progress for them, and this progress will also benefit countries with shorter hours of labor. A similar situation existed with respect to various other proposals which at present can not be realized internationally. The committee, therefore, decided in favor of a minimum program which contains only such demands as have been generally agreed upon by social economists as essential and which have been practically applied in individual countries. Demands for protective legislation for special trades must be deferred until the conference succeeds in creating an internationally recognized agency for the preparation and promotion of matters connected with such legislation. An exception was made by the committee with respect to protection of seamen, because this

international trade requires special acknowledgment. Otherwise the committee's program has been limited to problems of general protective labor legislation such as freedom of travel, right of coalition, social insurance, hours of labor, hygiene, accident prevention, home industry, protection of juvenile and female workers, and the enforcement of labor laws."

The spokesman of the committee then enlarged upon the necessity of energetic promotion of protective labor legislation through the peace treaty, as follows: "The national strength of the European countries has been diminished to such an extent that only extraordinary measures can rehabilitate it. In addition to the loss of millions of men, killed and crippled, the health of those who have survived, unwounded, the hardships, privations, and dangers of the War, has also been impaired. They will feel the physical consequences of the War all their lives and their working capacity will be reduced. Then there must also be considered the weakening of those who while staying at home have in unceasing work and with scanty nourishment expended their best energies. All this applies to all the belligerent European countries, and with respect to conditions of nutrition the neutral countries of Europe are also having great difficulties, the consequences of which are felt most by the working classes. Only socio-political measures on a large scale can help in overcoming the consequences of the War. In order to facilitate such measures certain minimum demands must be established by international action, and action of this kind must be taken in the peace treaty. The peace program submitted by the secretariat and adopted and supplemented by the committee takes into account this fact, the essentials of which are also embodied in the peace program of the Leeds conference. In adopting this program the conference admonishes the nations to acknowledge protective labor legislation as national protective legislation and to develop it as such."

The peace program advocated by the committee was as follows:

I. FREEDOM OF TRAVEL.

- (a) The enactment of prohibitions of emigration shall not be permissible.
- (b) The enactment of general prohibitions of immigration shall not be permissible. This provision shall not affect—

1. The right of each State to order temporary restrictions of immigration in times of economic depression in order to protect native labor as well as alien immigrant labor.
2. The right of each State to control and temporarily restrict immigration in order to protect the national health.
3. The right of each State to stipulate minimum requirements as to the ability of immigrants to read and write their mother tongue in order to protect its national culture and in the interest of efficient enforcement of the protective labor laws relating to industries in the branches of which immigrant labor is being prevailingly employed.

(c) The signatory States shall obligate themselves to incorporate in their legislation at the earliest possible date provisions which prohibit the hiring of contract labor from abroad and the activities for the same purpose of employment bureaus operated for profit.

(d) The signatory States shall obligate themselves to compile labor-market statistics from organized public employment offices and to interchange these statistics at the shortest possible intervals through an international central bureau, in order to prevent migration of labor to countries in which the chances for employment are small. These statistical reports shall be made accessible to labor organizations in particular.

II. RIGHT OF COALITION.

(a) The right of free coalition shall be granted in all countries to workmen. Laws and decrees (domestic-servant laws, prohibitions of coalition, etc.) which differentiate between individual classes of workmen or deprive them of the right of coalition and of representation of their economic interests shall be abrogated. Immigrant labor shall enjoy the same rights as native labor with respect to participation and activity in trade-union organizations, including the right to strike.

(b) Interference with workmen in the exercise of the right of coalition shall be made punishable.

(c) Alien workmen shall have the benefit of those wage and labor conditions which have been agreed upon by trade-union organizations with the employers of their trade. Where such agreements do not exist the prevailing wage rate of their trade in the locality shall be applicable to alien workmen.

III. SOCIAL INSURANCE.

(a) Countries which so far have not introduced insurance against sickness, industrial accidents, invalidity, old age, and unemployment shall obligate themselves to introduce such insurance at the earliest possible date.

(b) Immigrant workmen shall without consideration of the probable duration of their sojourn in the foreign country have the same status as to rights and duties in all branches of social insurance as native workmen.

(c) Workmen temporarily employed outside of their country (on assembling of machinery, etc.), as well as transportation workers (seamen, etc.) who usually work within the territory of several States shall be subject to insurance in that State in which the enterprise employing them is located.

(d) All documents and certificates relating to social insurance shall be executed without charge and be exempt from fiscal dues.

(e) Alien workmen who have departed from the country in which they have a legal claim to pension shall not lose their claims provided their own country has acknowledged the principle of reciprocity. Detailed provisions as to this question as well as to the mode of payment of the pensions and the regulation of the control of the pensioners shall be made in international treaties.

(f) These treaties shall also regulate whether trade diseases shall be considered as industrial accidents.

(g) Claims on the unemployment insurance of a country become extinct on departure from the country in which the claims have been acquired. Whether claimants shall be granted a travel subsidy is to be regulated by treaty.

IV. HOURS OF LABOR.

(a) The daily hours of labor for all workmen may not exceed 10 hours. The signatory States shall obligate themselves to issue legal regulations, according to which the daily hours of labor shall at fixed intervals be reduced in such a manner that after

a time limit to be fixed by agreement the eight-hour workday shall generally become the maximum legal workday.

(b) The hours of labor in mines, establishments with continuous operation, and in industries especially injurious to the health of the workmen shall be reduced to a maximum of 8 hours per day.

(c) Nightwork between 8 p. m. and 6 a. m. shall be legally prohibited for all establishments in which nightwork is not made necessary by the nature of their operation or for technical reasons. In establishments in which nightwork is permitted the hours of labor shall not exceed 8 hours per shift.

(d) All workmen shall be granted by law a weekly continuous rest period of at least 36 hours during the period from Saturday to Monday. Exceptions from this Sunday rest may be made only for the performance of labor required for the resumption of operation on Monday, for establishments which for technical reasons must be operated continuously, and for those activities which serve for the recreation and education of the people on Sunday. In all of these cases a 36-hour continuous rest period must be granted on week days. Exceptions are to be designated precisely in the law. In order to assure a 36-hour continuous weekly rest period establishments with continuous operation shall organize reserve shifts. The changing of shifts is to be so regulated that each workman is off duty at least every third Sunday.

(e) Those establishments whose processes are especially injurious to the health of workmen shall in each country be precisely designated by decree or law.

V. HYGIENE.

(a) The signatory Governments shall obligate themselves to promote in their countries the development of legislation on industrial hygiene. In particular endeavor shall be made to achieve uniformity of hygiene regulations for the individual industries, and to further a continuous common effort against the use of industrial poisons and particularly dangerous methods of production.

(b) In the work in the field of occupational hygiene designated under (a), the list of industrial poisons compiled by the International Association for Labor Legislation shall be used. Such poisons as can be replaced by less dangerous substances or materials shall be excluded from use in industrial establishments.

(c) Special regulations as to maximum hours of labor shall be agreed upon for the establishments designated under IV (c), having regard to the extent of occupational danger connected with the individual branches of industry.

VI. HOME WORK.

(a) All laws and decrees relating to the protection of labor shall be applicable to home work.

(b) Social insurance shall be extended to home workers.

(c) Home work shall be prohibited—

1. In the case of all work which may involve serious injuries to the health of the workmen, or their poisoning.

2. In the food, beverage, tobacco, etc., industries.

(d) It shall be made obligatory for home workers to notify the authorities whenever they are afflicted with an infectious disease.

(e) Medical inspection of juvenile home workers, analogous to inspection of school children, is to be introduced in all countries.

(f) The keeping and inspection of lists of all workers and intermediary undertakers (subcontractors) in home industry, as well as the keeping of wage books for all home workers, shall be made obligatory.

(g) Equipartisan wage boards shall be established in all districts having home industries and shall determine legally binding wage rates. Lists showing the wage rates shall be posted in the workrooms.

VII. PROTECTION OF CHILD AND JUVENILE LABOR.

(a) Children under 15 years of age shall be prohibited from exercising any gainful occupation.

(b) Juvenile workers 15 to 18 years of age may not be employed longer than 8 hours per day and must be granted $1\frac{1}{2}$ hours' rest after 4 hours of continuous labor. Provision shall be made for the instruction of male and female juvenile workers in continuation and trade schools, the hours of instruction to fall between 8 a. m. and 6 p. m. Juvenile workers must be granted time to attend these schools.

(c) The employment of juvenile workers shall be prohibited—

Between 8 p. m. and 6 a. m., and on Sundays and holidays; in establishments particularly injurious to the health; in mines on underground labor.

VIII. PROTECTION OF FEMALE LABOR.

(a) The hours of labor of all female workers and salaried employees in large and small industrial establishments, trades, commerce, transportation, and public traffic, as well as in home industries, shall be limited to 8 hours per day and 41 hours per week. On Saturdays the hours of labor shall terminate at noon (12 o'clock) so that such female workers and salaried employees shall be assured a continuous rest of at least 42 hours until Monday morning. Employment of female workers during the time between 8 p. m. and 6 a. m. shall be prohibited.

(b) Undertakers (entrepreneurs) shall be prohibited from giving female workers and employees work to take home to be done after termination of the hours of labor.

(c) The employment of female workers in industries particularly injurious to the health (IV (e)) and in mines both above and below ground shall be generally prohibited.

(d) Before and after confinement women may not be employed in industry for a total period of 10 weeks, of which at least 6 weeks must fall in the time after confinement. The introduction of maternity insurance with a minimum benefit equivalent to the legal sick benefit shall be made obligatory for all States.

IX. ENFORCEMENT OF PROTECTIVE LABOR LEGISLATION.

(a) An efficient industrial inspection service for large and small industrial establishments, trades, home industries, commerce, and transportation, as well as for agricultural establishments using machinery, shall be organized and developed in all countries.

(b) The officers of the inspection service shall be appointed from among technical experts, as well as from among workmen and salaried employees. Their number shall be sufficiently large to insure the inspection of each establishment at least once every half year. The officers of the inspection service shall be granted executive power and be compensated adequately so as to insure their independence. Women shall be employed as inspection officers for the enforcement of the provisions relating to female labor.

(c) Trade-unions organized by virtue of the right of coalition, which is to be granted in all countries, shall cooperate in the efficient enforcement of protective labor legislation. Trade-unions shall in particular be obligated to aid the industrial inspection officers through their committees, secretariats, etc.

(d) In order to assure enforcement of protective labor legislation, owners of establishments with at least five workmen speaking only a foreign language shall be legally obligated to establish at their own expense and under supervision of the educational authorities courses of instruction in which the immigrant workmen may learn the language of the country.

(e) The International Association for Labor Legislation shall explicitly be recognized in the peace treaty as the medium for the promotion and enforcement of international protective labor legislation. The International Labor Office maintained by this association shall collect and publish in the three principal languages all socio-political material, such as statistics, social insurance and labor laws, important decrees and orders, etc., supervise the enforcement of socio-political agreements incorporated in international treaties, remain in constant communication with the central labor offices or Government departments charged with the duties of labor offices, prepare on request opinions on various matters relating to socio-political legislation, undertake the preparation and direction of international investigations in this field, and make studies of everything relating to the development and application of social legislation. The International Labor Office shall in particular act as intermediary in the quick exchange of labor market statistics (I (d)) among the various countries.

(f) The International Federation of Trade-unions shall be granted representation in the International Labor Office.

(g) The International Labor Office shall periodically convoke international congresses for the promotion of labor and social legislation to which the signatory States shall send official representatives. The signatory Governments shall bind themselves to aid in the realization of the resolutions of these congresses.

(h) The costs of maintenance of this office shall be borne by the signatory States.

The program as to peace demands submitted by the committee was unanimously adopted by the conference; as was also the following resolution submitted by a German representative:

In connection with the adoption of a program as to peace demands the International Conference of Trade-unions addresses to the representatives of the trade-unions and of labor of all countries the urgent appeal to work with all means at their disposal for the recognition and realization of these demands of labor. All national central organizations of trade-unions shall obligate themselves to submit to their Governments at the earliest possible date the demands formulated by the conference and to induce them to support at the peace negotiations the acceptance of the international demands of labor. The conference demands and expects from the Governments of all countries participating in the peace negotiations the admission of representatives of the trade-unions of each country to the discussion and determination of the social-economic part of the peace conditions.

After the adoption of this resolution the conference was closed by its president. On October 7, three days after the close of the conference, the Swiss Federation of Trade-unions received a telegram dated October 2, which announced that the Italian delegation had been prevented from attendance by the refusal of the Italian Government to issue passports to the members of the delegation. A communication was also received in which the Finnish trade-unions expressed their regret at being prevented by transportation difficulties from attending the conference.

SEVENTH CONGRESS OF THE SWEDISH TRADE-UNIONS.¹

The seventh congress of the National Organization of Swedish Trade-unions took place in Stockholm in the week August 20-25, 1917. In addition to the representatives of the central organization 310 representatives of affiliated federations attended the congress. The trade-unions of Denmark, Norway, Finland, and Germany also sent representatives.

During the preceding congress (in 1912) the after effects of the great general strike of 1909 had not yet been overcome, but the downward movement of the membership had reached its lowest point with 83,000 members. Since then there has been a considerable change for the better. The continuously increasing cost of living since the outbreak of the world war has forced the working classes in Sweden as in all other countries to try to obtain wage increases with the aid of the trade-unions. For this reason the membership of the trade-unions increased as greatly as in the years before the general strike of 1909. While on January 1, 1912, the federations affiliated with the central organization had only 80,707 members, on January 1, 1917, the membership had risen to 140,802, and during 1917 the membership continued to increase so that in August 169,000 members were represented at the congress.

The published annual report of the central organization, which at the congress was supplemented by remarks of Herman Lindquist, points out this favorable development of the trade-union movement and contains numerous statistical tables of wage movements which indicate the intensive activity of the individual federations in the interest of their members. Most wage movements had the object of obtaining wage increases on the occasion of renewals of collective agreements. In addition to increased wages the federations in many instances endeavored to obtain high-cost-of-living bonuses. The extensiveness of the wage movements in Sweden during 1916 is shown by the fact that a total of 1,001 movements covering 5,698 employers and 114,872 workmen is reported for the year. The report states that on the outbreak of the war wage movements and strikes were discontinued in Sweden. The mobilization disorganized for some time all industrial activity. Extensive unemployment was the consequence, and employers made attempts to depress wages. All such attempts were, however, frustrated by the trade-unions. Conditions improved slowly but steadily and the panic of 1914 was succeeded by the most intensive industrial activity and general prosperity.

¹ Correspondenzblatt der Generalkommission der Gewerkschaften Deutschlands, vol. 27, No. 38. Berlin, Sept. 22, 1917.

The finances of the Swedish trade-unions show a very favorable development during the five-year period ending January 1, 1917. On January 1, 1912, the capital of 30 federations was 1,185,671 crowns (\$317,759.83) or 11.63 crowns (\$3.12) per member, while on January 1, 1917, it had increased to 4,451,728 crowns (\$1,193,063.10) or 28.84 crowns (\$7.73) per member.

The split within the Swedish Social-Democratic Party was greatly in evidence at the congress. A motion to invite the participation of the new Social-Democratic "Independent" Party received a large negative vote. The old dispute as to the political attitude of the trade-unions was revived. Several motions made at the congress demanded separation of the trade-union organization from the Social-Democratic Party. A vote on the question resulted in a victory for the central organization which supported adherence to the party.

Discussion of the problem of syndicalism took up considerable time of the congress. The discussion related less to the nature of syndicalism than to the question as to whether members of trade-unions should jointly and separately oppose syndicalistic strikes. The discussion was ended by the adoption of a resolution which provided that the by-laws of the national central organization and of the national federations shall be binding on the members as to their attitude toward strikes in which they are not personally interested. This resolution refers to all strikes and not only syndicalistic strikes.

A resolution of the congress provided for promotion of local trade-union councils and the granting of subsidies to them by the national central organization. Another resolution set aside 10,000 crowns (\$2,680) for propaganda among rural workers. Creation of an official organ of the central organization was unfavorably voted on by the congress on account of lack of funds. The congress adopted two important resolutions relating to amendment of the by-laws of the central organization. The first of these resolutions amends the right of representation at general conferences of trade-union directorates by providing that federations with less than 10,000 members shall be allowed to send one representative, those with 10,000 to 20,000 members two representatives, and for each additional 20,000 members or fraction thereof one more representative. The second resolution restricted the representation at future congresses to 250 delegates to be elected by the federations on the basis of their membership.

WORKMEN'S COMPENSATION.

WORKMEN'S COMPENSATION AND ACCIDENT INSURANCE IN MARYLAND.

The third annual report of the State Industrial Accident Commission of Maryland,¹ covering the year ending October 31, 1917, states that in the administration of the workmen's compensation law, covering 11,010 employers engaged in extrahazardous employments, the commission received reports of 37,434 accidents (an increase of 19.5 per cent over the preceding year), 32,329 of which carried first aid and subsequent medical treatment at a cost to the insurers of \$98,602.68. The accidents in these cases, it appears, did not cause disability beyond the waiting period of two weeks and therefore did not carry weekly compensation. However, in 4,677 cases weekly compensation and also medical and other treatment were awarded. The report further states that during the year there were paid to beneficiaries under the act \$591,211.06, and that there remained outstanding at the end of the year \$279,715.36 to be paid in the future on awards made during the year in fatal cases and cases of permanent disability in which specific awards could be made, besides a large number of outstanding claims for temporary disability cases, the aggregate amount of which can not be given. A plea is made by the commission for a larger annual appropriation than the \$55,000 now allotted by the State.

The report states that there were filed during the year 5,117 claims, of which 12 were duplicates, leaving 5,105 claims for compensation, of which 131 were for fatal cases. Awards were made in 4,677 cases, as already noted, the distribution of benefits being indicated in the following statement taken from the report:

<i>Amounts awarded.</i>	
102 awards in fatal cases.....	\$244,354.83
398 awards in cases of permanent partial disability.....	119,618.19
Total awarded in specific awards.....	363,973.02

To this must be added the cumulative amount awarded for cases of temporary total disability, which run during the continuance of disability and therefore can not be definitely estimated in advance, in order to measure the benefits which the operation of the law has effected during the year.

¹ Third annual report of the State Industrial Accident Commission of Maryland for the year Nov. 1, 1916, to Oct. 31, 1917. Baltimore [1918]. 52 pp.

Amounts paid during the year to beneficiaries in compensation, medical, and other expenses.¹

Permanent partial.....	\$53,815.86	
Temporary total.....	361,664.83	
Fatal.....	30,461.60	
Medical expense.....	40,439.84	
Funeral expense.....	6,226.25	
Total in claim cases.....		\$492,608.38
Reported medical in accident cases in which there was no claim.....		98,602.68
Total benefits paid.....		591,211.06
Outstanding to be paid in the future on awards made during the year in—		
Fatal cases.....		213,913.23
Permanent partial cases.....		65,802.13
Total.....		870,926.42

Some general facts connected with the awards may be noted, the numbers and percentages in each case being the largest in the particular group considered: "Falls of persons" was the cause of injury or death in 937 cases (18.4 per cent); 1,503 (29.4 per cent) cases involved cuts and lacerations; most of the awards, 2,345, or 45.9 per cent, were made to laborers both skilled and unclassified; in 937 cases (18.4 per cent) the fingers were affected; the ages of those receiving awards were between 35 and 39 in 705, or 13.8 per cent, of the cases; and 2,538 (49.7 per cent) of the injured or killed were receiving from \$10.01 to \$15 per week, while 3,459, or 67.8 per cent, were receiving \$15 or less.

The following is a statement of the condition of the fund as of date October 31, 1917:

ASSETS.

Cash on deposit, State treasury.....	\$55,359.40	
Stocks and bonds.....	128,450.00	
Accrued interest on above and on deposits.....	1,393.67	
Policyholders' accounts (premiums in course of collection).....	24,759.45	
Total assets.....		\$209,962.52

LIABILITIES.

Reserve for losses.....	\$61,117.58	
Reserve for unearned premium.....	7,519.69	
Reserve for reinsurance.....	2,736.95	
Reserve for expenses (Jan. 1, 1917, to Oct. 31, 1917) ²	8,200.62	
Reserve for special surplus ³	26,145.54	
Reserve for surplus.....	104,242.14	
Total reserves.....		209,962.52

¹ The number of cases involved is not given in the report.

² To be paid into the State treasury after Jan. 1, 1917. Sec. 27, ch. 597, Acts of 1916.

³ Sec. 23, ch. 800, Acts of 1914.

INCOME AND DISBURSEMENTS.

Income.

Net premiums written.....	\$142,979.83	
Interest on deposits.....	540.29	
Interest on investments.....	3,275.00	
Accrued interest on deposits and investments.....	1,393.67	
Total income.....		\$148,188.79

Disbursements.

Losses paid, medical.....	\$10,318.50

Losses paid, permanent total disability.....	593.23	
Losses paid, temporary partial disability.....	192.36	
Losses paid, permanent partial disability.....	3,396.73	
Losses paid, death (dependency).....	6,707.02	
Losses paid, death (no dependency).....	150.00	
		36,391.19
Less amount paid on account of accidents that occurred prior to November 1, 1916.....		13,649.20
Net losses paid for 12 months ending October 31, 1917.....		22,741.99
Reinsurance.....		3,085.18
Return premiums.....		247.16
Reserve for expenses ¹ (due State treasurer Jan. 1, 1918).....		8,200.62
Reserve for losses (accidents Nov. 1, 1916, to Oct. 31, 1917).....		36,406.94
Reserve for reinsurance.....		2,736.95
Reserve for special surplus ² (on premiums written Nov. 1, 1916, to Oct. 31, 1917).....		14,297.98
Reserve for surplus (additional account business Nov. 1, 1916, to Oct. 31, 1917).....		60,471.97
Total disbursements.....		148,188.79

OPERATION OF THE OHIO STATE INSURANCE FUND.

The Ohio Industrial Commission has just published a report containing a survey of the operations of the State insurance fund.³ This report is issued as a communication to the subscribers to the fund and is an effort to determine the amount the Ohio plan has saved the employers of the State. The commission applied the stock company rates to the earned pay roll which had been developed under the Ohio plan and found that the premiums thus computed from July 14, 1911, to May 15, 1917, would have amounted to \$27,174,402.59. Deducting from this sum 2½ per cent loading for taxes and 16 per cent for a possible reduction of rates on account of faulty operation of the merit rating system, leaves \$22,255,835.73 as the minimum amount of insurance premiums that would have

¹ To be paid into the State treasury after Jan. 1, 1917. Sec. 27, ch. 597, Acts of 1916.

² Sec. 23, ch. 800, Acts of 1914.

³ A Survey of the Workmen's Compensation Insurance Field in this Country. Bulletin of the Industrial Commission of Ohio, December, 1917.

had to be contributed by the employers of the State. On the other hand the actual total losses of these subscribers to the State fund for the same period were \$12,967,486.92, and the aggregate cost of administering the State fund was \$1,101,406.51, making a grand total cost of \$14,068,893.43. The cost of administration includes the original cost of organizing the State fund, all rating inspections, statistics, claims, investigations, settlements, and the commercial rate of rent on all office space. The saving to the employers therefore has been "the difference between \$22,255,835.73 and \$14,068,893.43, or \$8,186,942.30. In other words, the increase in the cost of the plan of the liability insurance companies over the Ohio plan is as an absolute minimum 58 per cent."

The report further states that "the earned premium of the Ohio State insurance plan for 1917 will be approximately \$8,000,000. The total cost of administering the Ohio State insurance plan for 1917 is \$312,279.30. (Incidentally the interest earnings of the fund for the year have been \$304,455.27. * * *) Computed on the basis of their 40 per cent expense ratio, it would have cost the liability insurance companies \$5,333,000 to have provided this \$8,000,000 in compensation benefits. * * * It is conservative to state, therefore, that for the single year 1917 the Ohio State insurance plan has saved its subscribers, as an absolute minimum, \$5,000,000." Using the same basis of computation for the entire country the commission concludes that had the Ohio plan been in operation throughout the United States it would have saved the employers of this Nation in the single year of 1917 the sum of \$23,400,000.

The following four reasons are given why the Ohio plan would result in such great saving to the employers: (1) The factor of acquisition cost or agents' commissions would be eliminated; (2) duplication of work in pay roll auditing, claim adjustments, statistical computations, and so on, would also be eliminated; (3) the maintenance of a home office in the East with its heavy attendant expense would be unnecessary; and (4) the Ohio plan pays no dividends to stockholders.

The report traces the development of the State fund insurance plans in the United States. The cumulative annual premium income in 1911 was \$422,818.20, while in 1917 it had increased to \$53,131,043.67. "Thus, whereas in 1911 the liability insurance companies had substantially a complete monopoly of the industrial accident field in the United States, in the brief space of six years the State funds have entered and are now already writing almost one-third as much business as are these companies."

The report also contains two sets of comparative insurance rates for practically all risks or classifications. One compares the Ohio

rates of March 1, 1912, with those in effect July 1, 1917; the other compares the rates of nine States (New York, California, Illinois, Wisconsin, Indiana, Michigan, Kentucky, Colorado, and Pennsylvania) which were in effect in 1917.

WORKMEN'S COMPENSATION INSURANCE RATES FOR MINING AND SMELTING IN UTAH.

The State of Utah, which enacted a workmen's compensation law in 1917, has just adopted a schedule of insurance rates for mining risks for the State insurance fund. These rates, which were computed by the National Workmen's Compensation Service Bureau of New York City, have been critically analyzed in a report made to the Utah chapter of the American Mining Congress by Dr. I. M. Rubinow.¹

The question of reasonable and adequate insurance rates under workmen's compensation laws is an important one from the viewpoint of the employer. The determination of adequate rates, however, because of insufficient accident experience and the complex actuarial factors involved, is a difficult one.

Two main factors enter into the making of compensation rates—(1) the basic pure premium or actual cost of compensation benefits, and (2) the multiplier, composed chiefly of the law differential and the loading expense or cost of administration. Dr. Rubinow has subjected each of the several factors to a critical examination and concludes that the rates computed by the national bureau and adopted by the Utah Industrial Commission are too high. These rates and the basic pure premiums upon which they are based are as follows. The multiplier for the State of Utah was computed at 2.49.

	Basic pure Premiums. premium.	
Clay and shale—surface.....	\$3. 70	\$1. 48
Gold mines.....	4. 54	1. 70
Ore concentration.....	4. 04	1. 62
Metal mines.....	5. 59	2. 24
Iron mines.....	6. 70	2. 69
Smelting.....	6. 11	2. 45

BASIC PURE PREMIUMS.

As already noted, the basic pure premium means the net cost of compensation losses in each classification, ascertained from experience and reduced to the basis of the old Massachusetts compensation law of 1912, which is now obsolete. In ascertaining this basic pure

¹ Report on Insurance Rates for Mining and Smelting under the Workmen's Compensation Law of Utah, by I. M. Rubinow, consulting actuary and statistician, New York City, to Utah chapter, American Mining Congress, June 6, 1917. 23 pp.

premium, experience of many States has been used. But in view of the difference in the compensation scales of different States, the experience of many States is reduced to what it would be on the scale of the old Massachusetts act. The basic pure premium of \$2.24 for metal mines has been accepted without criticism inasmuch as all such premiums have been agreed upon by a so-called standing committee in which stock companies, mutual compensation companies, State insurance funds, and State insurance departments were represented. These basic pure premiums represent the best information and judgment available and, as regards mining, based upon many million dollars of experience from Colorado, California, Michigan, and other States.

THE MULTIPLIER.

The multiplier of 2.49 consists of five factors:

1. Loading for underestimates of outstanding losses..... 1.02
2. Factor of law differential..... 1.30
3. Factor of loading for increased industrial activity..... 1.10
4. Expense loading, 40 per cent of gross premiums.
5. Loading for profits, $1\frac{1}{2}$ per cent of gross premiums.

The formula used is as follows: $\frac{1.02 \times 1.30 \times 1.10}{.585} = 2.49.$

The denominator of 0.585, or 58.5 per cent, is obtained by subtracting from 100 per cent the total of factors 4 and 5. These several factors of the multiplier are analyzed in detail in the report.

UNDERESTIMATE OF OUTSTANDING LOSSES.

The loading of 2 per cent is based upon the theory that the experience from which all rates are to be computed consists partly of losses actually paid and partly of losses not yet paid and outstanding. These latter losses are estimates, and it is claimed that on the whole they are somewhat lower than they should be. To correct this error the actuarial committee of the national conference has agreed to load the pure premiums for this factor by 1.02. The author suggests that after four or five years of experience the insurance companies should have learned sufficiently to estimate outstanding losses, and therefore it should not be necessary to load for underestimates; but since this loading of 2 per cent is not a very heavy burden and has been unanimously adopted, no objection should be raised against it.

LAW DIFFERENTIAL.

The law differential for the Utah act was computed by the National Workmen's Compensation Service Bureau at 1.30. This law differential measures the comparative cost of the Utah law in proportion

to the old Massachusetts act. In other words, the scale of benefits under the Utah act are 30 per cent higher than those of the 1912 Massachusetts law would have been. While adhering strictly to the method of computation used by the national bureau, Dr. Rubinow has arrived at the substantially smaller differential of 1.18 instead of 1.30. The details of this computation are given in the report. The different result obtained is stated as being entirely due to information as to wage conditions in the Utah mines, which data have never been published, and were therefore not available to the committee compiling the differential in New York. The reason why wage conditions affect the law differential is given as follows:

Most compensation benefits are expressed in weeks' wages. The premiums are also computed as a percentage of the pay roll. Therefore, the computation of a law differential is made by estimating cost of accidents, not in dollars and cents, but in weeks' wages. In the Utah law are certain provisions about maximum benefits which substantially reduce the cost of compensation. In payment for temporary disability and also for dismemberment there is a \$12 maximum limit. In payments for fatal cases and for total permanent disability there is a \$15 per week maximum limit. In other words, while the law in general provides for a 55 per cent benefit scale, a great many workmen will receive a good deal less than that.

This fact was, of course, well known to the committee which computed the Utah differential. Evidently the saving will be greater whenever wages are higher. If the injured workman receives only \$2 or \$3 per day, little will be saved of this compensation because of a maximum limit. If the injured workman is a miner, receiving \$4, \$5, or \$6 per day, the saving produced by the maximum will be substantial, and the higher the wage the greater the saving.

The New York committee had no data in regard to wages paid in the Utah mines, nor, in fact, in regard to any wages paid in Utah. Therefore, in order to estimate the saving produced by this maximum limit provision of the law, they have used some statistics of wages in California, for 1914 or 1915. The average wage in the statistics used by the committee was \$18.95 per week. Information collected by me here in regard to the 7,400 employees in mines and reduction mills indicates an average weekly wage of \$27.65, obviously producing a very much larger saving than the committee figured on.

My computations indicate that a maximum limit of \$12 produces a saving of 20 per cent as against what the cost would have been without such limit, while the bureau committee only allowed a discount of 5 per cent for that. The \$15 limit produced in my computation a discount of 10 per cent as against one of 3½ per cent in the bureau's computations.

The second point where I am forced to differ from the bureau is in the cost of medical aid, and that also largely depends upon the same factor of wages.

The average cost of medical aid under the old Massachusetts law was estimated at nine-tenths of a week's wage. Since the Massachusetts law gave medical aid only for two weeks, and the Utah act provides for medical aid up to \$200, the committee figured the charge for the average cost of medical aid at 1.4 of a week's wage. This charge would not be excessive if it only meant an increase of some 50 per cent in cost, but as a matter of fact, it means a good deal more than that. The average wage in Massachusetts is about \$14.22, and nine-tenths of that makes the average cost of medical aid per case in Massachusetts \$12.80, while the average wage in the metal mines and mills of Utah is \$27.65, and 1.4 times that amount equals \$38.71, which is in my opinion

entirely too high. The allowance I made of 1.17 week's wages per case will give \$32 per case, and should be more than ample.

It thus appears that, without going into the discussion of the law differential for the entire manual and classifications where the differential of 1.30 may be fully justified, the differential of 1.18 should be more than ample for mines and metal mills.

As a matter of fact, even without going into actuarial details, these are practically the conditions as between the Utah law and the old Massachusetts act:

1. The scale of benefits is 55 per cent instead of 50 per cent, thus adding 10 per cent to the cost.

2. The waiting period is reduced to 10 days instead of 2 weeks, a slight addition of perhaps 1 per cent or 2 per cent to the total cost of the act.

3. The cost of permanent partial disability cases and dismemberments is about the same, but the premium totals are much more costly in case of total permanent disability providing for life benefits. This case, however, is extremely rare. The provisions for medical aid are more liberal.

As against these factors of increasing cost there is, as already pointed out, the very material saving produced by the maximum limit applied to the high Utah wages.

It may also be pointed out that there is a strong probability of this saving becoming greater, as wages are likely to continue to increase in the next year or two. Over 75 per cent of wageworkers under present wage conditions would receive \$12 per week instead of 55 per cent of their wages, and 40 per cent of the wageworkers in case of total permanent disability or death will receive \$15 instead of 55 per cent. With an increase in wages this difference will be still greater.

The statistical tables and methods of computation by which the author arrived at the law differential of 1.18 are given in detail in the report. Briefly, it is the application of his "standard accident table" to the Massachusetts and Utah compensation laws.

LOADING FOR INCREASED INDUSTRIAL ACTIVITY.

A loading for increased industrial activity was placed upon compensation rates for the first time this year. This loading for Utah has been computed at 10 per cent. It is claimed that the experience used for computing the basic pure premiums refers to 1912, 1913, and 1914, and partly to 1915, and therefore would be misleading when applied to the cost in 1917. The committee in New York which decided to put on an additional loading for this difference between the cost in 1912 to 1914 and a probable cost next year, has given the following reasons:

The intense business activity has caused establishments to speed up. This in return has resulted in the employment of inexperienced help, in the overworking of the help, in the casting aside of safety campaigns and safety measures of one kind and another, in the overcrowding of factories, etc.

Industrial activity has caused a shift in employment. This shift was doubtless very general and affected workers in all occupations. Together with this shift of labor there was undoubtedly some adopting of labor sources not usually used. On the whole, the shift on labor placed many workmen in positions which they had not had sufficient training to fill efficiently, and which they never would have been called upon to fill under normal conditions.

Dr. Rubinow states that on the whole it seems preferable to accept the loading factor of 1.10 for increased industrial activity as a margin of safety. The difficulties of the labor market are generally recognized, and they may affect the mines in Utah to some extent. The other consideration as to the overworking of help and the overcrowding of workshops probably does not apply to the mines and metal mills. These factors, however, were left in by the author, so as to meet the possible argument that an effort has been made to reduce the cost below the lowest level compatible with safety.

EXPENSE LOADING.

The expense loading is the insurance carrier's cost of doing business or the general administration expenses. This includes the expense of acquisition, administration, inspection and claim adjustment, taxes, and special items. The stock casualty companies are at present doing compensation business at an expense of 40 per cent of the gross premiums. In addition, for the first time a special profit loading of $1\frac{1}{2}$ per cent on gross premiums has been provided for. A loading for expense and profit of $41\frac{1}{2}$ cents on the dollar of gross premiums means that only $58\frac{1}{2}$ cents are left for payment of losses. Finally, 1 cent is added to the premium rate of each classification as a general loading for catastrophe hazards. The question, however, is not so much whether this entire method should be accepted or rejected, but only how far the various factors and loadings are applicable to mining conditions in Utah.

In defense of this expense loading, it is claimed by the casualty companies that compensation on an average requires some 40 per cent expense, distributed as follows:

Acquisition expense.....	16.9
Administrative expense.....	9.1
Inspection and adjustment expense.....	10.5
Taxes and special items.....	3.2
Total.....	39.7

After an examination of the several factors comprising the expense loading the author concludes that a loading of 30 per cent is sufficient. Several arguments are offered justifying this conclusion. In the first place the high premium rates and also the large pay-roll exposure would justify a reduction in the expense loading since the agency commissions and administrative expense would be lower. Moreover, the fact that several casualty companies have combined to write coal-mine insurance in many States on a basis of 25 per cent for expense loading leads the author to believe that a lower expense loading may also be possible in case of metal mines. The experience

of mutual companies is also cited. Such mutual companies writing compensation insurance in the East with similar average premium policies here reported an expense loading of 18.3 per cent.

The author concludes his report with a discussion and analysis of insurance rates for coal mines.

WORKMEN'S COMPENSATION INSURANCE AND THE CATASTROPHE HAZARD.

The problem of the catastrophe hazard, involving the infliction of large losses by the occurrence of a single accident, is not a new one in the field of employers' liability insurance, but with the establishment of the workmen's compensation system its importance has been greatly increased. This was emphasized early in the history of workmen's compensation in this country by the so-called Chehalis disaster, in which 8 out of 10 of the employees in a factory manufacturing fireworks in the State of Washington lost their lives on November 1, 1911, one month after the compensation law of that State had gone into effect, this being also the first year in which any effective State law became operative. The number of persons killed, while not large in comparison with the results of mine explosions, was disproportionate in relation to the number of persons in the class to which the employment was assigned under the Washington statute, and had the effect of seriously overburdening the fund, a condition from which it has not yet extricated itself.

The law of West Virginia, also providing for classified funds for State insurance, went into effect in October, 1913. A truly catastrophic disaster occurred in April of the following year, in which 183 persons were killed, involving costs and liabilities in excess of \$223,000. The next largest disaster affecting this fund occurred in March, 1915, when 112 men lost their lives in a single explosion, costing the fund an additional \$140,593. The Washington authorities have been seeking a remedy in the enforcement of contributions from the larger employers in the industrial group affected, while in West Virginia a reserve fund was provided for by an act of 1915, "to cover the catastrophe hazard and all other unanticipated losses." Obviously both of the methods must be brought into play to secure the proper protection of employees exposed to hazards of the nature under consideration, since an unsupported fund, no matter what percentage of contributions are set aside for reserves, will not be adequate; while on the other hand, a fair average rate of contributions can not be counted upon to meet the catastrophe hazard in extra-hazardous employments.

It is only in a minority of the States thus far, however, that the question must be met by either of these methods, since in most instances the insurance is carried, not in a State fund, but in insurance companies, stock or mutual. In the incipency of the movement, stock companies were inclined to refuse extrahazardous risks, of which coal mining is the most conspicuous instance, listing them in their instructions to agents as "prohibited risks." Inasmuch, however, as the prosecution of such industries is essential, it was obviously undesirable that employees engaged therein should be without the protection of an adequate guaranty for the payment of the compensation contemplated by the law. About two years ago, therefore, 10 of the principal companies engaged in insurance of workmen's compensation formed a pooling system, calling themselves The Associated Companies, for the especial purpose of bearing collectively the risks involved in insuring the payment of compensation to employees in coal mines. The favorable results of this organization have led to the extension of the arrangement to a class of risks recently greatly enlarged, i. e., the manufacture of munitions for the use of the United States and its Allies, and to certain other industries. The urgency of the situation is no less than in the case of coal mining, and the hazard is equally as great, if not greater. The experience of The Associated Companies with regard to coal-mine insurance led to the development of a proposition which was made public on January 12, through the chairman of The Associated Companies. Beginning with a brief account of their experience in handling coal-mining risks, the enumerated companies announce that they, "under the same operating name, have now entered into a supplemental agreement to provide a coinsurance and reinsurance method for handling not only risks possessing an obvious element of collective hazard, but risks which for other reasons are difficult subjects of insurance for a single company." The classifications proposed to be covered are not ready to be announced, but "can best be described by the term 'prohibited risks,' if we adopt the vernacular of the insurance office."

The grounds for the action are stated in the following paragraphs:

These companies unanimously believe that there should be no such thing as an uninsurable workmen's compensation risk if the elements of hazard are limited to those which are necessary and inherent in the business. The reason for the maintenance of a prohibited list by individual companies is that certain risks, because of the collective hazard involving possible injuries to many persons in one accident, or because of other conditions which can not be fully described except at great length, can not be adequately distributed by one company, however large its premium income or however wide its distribution, under the existing practices and requirements of compensation insurance. Compensation insurance properly written involves an unlimited policy undertaking so far as amount is concerned, and ordi-

narly involves the requirement that the entire risk should be accepted by one company. Safety for both the policyholder and the company is obtained only by sufficient distribution. Distribution is sometimes attempted by ordinary reinsurance methods. Under this practice one company takes the risk entire and reinsures parts of it with other companies. Such other companies are ordinarily not disclosed to the policyholder, and the policyholder has no contract relation with them. Such reinsurance methods fail to meet the peculiar requirements imposed by compensation and, therefore, other methods should be devised which will positively provide not only cohesiveness and continuity of the reinsuring interests but also uniform treatment of difficult risks and maximum protection to both the employer and employee engaged in hazardous undertakings.

The arrangement now perfected for handling these difficult risks is in reality an extension and simplification of the long-existing theory of coinsurance rendered uniform and certain by a joint and several policy rather than by independent policies of companies involving a joint and several obligation.

The Associated Companies propose not only to provide indemnity according to the provisions of the law and of their contracts, but to render service in behalf of safety and the reduction of accidents by the combined knowledge and experience of the whole group.

The gross assets of the companies forming this combination were at the end of the year 1916 in excess of \$300,000,000, no doubt considerably increased during the ensuing year, though the figures are not yet available. The protection of this fund will be extended to any employer who "will give proper attention to, and provide suitable remedy for, the unfavorable elements of the risk which are within his control. The 'prohibited' list of the future, therefore, will include only those employers who, because of indifference, unwillingness or deliberate design, refuse to improve and maintain the moral and such of the physical conditions of their risks as are capable of improvement and which, if unimproved, constitute a hazard against which no insurance should under any circumstances be provided."

ACCIDENT COMPENSATION AWARDED FOR NYSTAGMUS.¹

A decision very important for miners has recently been rendered by the Superior Insurance Office in Dortmund, Germany, with respect to the claim of a miner for award of an accident pension for nystagmus developed consequent to an accident. Nystagmus is a spasmodic movement of the eyes, rotatory or from side to side, frequently affecting miners and others working in a dim light and a stooping position.

The miner in question suffered an accident on September 10, 1915. He was hit on the right parietal bone by a piece of rock weighing about 1 pound. A week later the injury caused develop-

¹ Correspondenzblatt der Generalkommission der Gewerkschaften Deutschlands. Arbeiterrechts-Beilage, No. 10, Berlin, Oct. 13, 1917.

ment of erysipelas. On November 1, 1915, the miner was again able to resume his work but even during the first shift he observed that he could not see well and had the feeling that all objects whirled round him (objective vertigo). He consulted a physician who diagnosed it nystagmus. Subsequently the nystagmus became so violent that the workman could not continue in his occupation as a miner and after long idleness had to accept less remunerative employment in the mine at repair work. A claim for accident pension filed by him with the Miners' Trade Accident Association was disapproved. In disapproving the claim the association stated that nystagmus is a common trade disease among miners and may have been latent in the case of the claimant and that proofs were lacking that the nystagmus of the claimant had been caused or aggravated by the accident.

In the subsequent proceedings on appeal voluminous expert medical testimony bearing directly or indirectly on the case in question was introduced. It was pointed out that a large number of medical authorities, particularly in France and Belgium, take the point of view that nystagmus can be caused through accident or disease. A lengthy medical opinion rendered by the Royal Eye Clinic in Marburg where the claimant had undergone examination stated in a very positive manner that in the case of the claimant everything points to causal connection between the accident and his disability due to nystagmus. This opinion estimated that the earning capacity of the claimant had been reduced 20 per cent and the Superior Insurance Office in Dortmund concurred with this opinion and ordered the Miners' Trade Accident Association to grant the claimant a pension corresponding to 20 per cent of his previous computable annual earnings.

The decision rendered in this case is of special importance for miners because up till now it has always been disputed that the manifestation of latent nystagmus can be caused through an accident. Nystagmus has always been considered as a trade disease no matter what phenomena accompanied its manifestation.

INDUSTRIAL ACCIDENTS AND DISEASES.

BLINDNESS FROM INDUSTRIAL USE OF WOOD ALCOHOL.

The following article by Dr. John M. Robinson, of Duluth, Minn., is reprinted from the *Journal of the American Medical Association* for January 19, 1918 (p. 148). It gives an account of a case of blindness resulting from the industrial use of a commercial product containing a 4 per cent solution of wood alcohol, with some discussion of the danger of poisoning from denatured alcohol containing wood alcohol as the denaturing fluid. In connection with this article reference should be made to an article by Dr. Alice Hamilton in the *MONTHLY REVIEW* for February, 1918, on "Dope poisoning in the making of airplanes," in which there is further discussion (p. 47) of the danger of using wood alcohol as a denaturing agent.

T. P., aged 29, a Greek of good physique, was referred, June 1, 1917, to my ophthalmic service at the Duluth Free Dispensary because of some difficulty which an optician had had in fitting the man with glasses. Complaint was made that objects looked smoky, and that the sight of the left eye had been failing for six weeks. Vision of the right eye was 20/30 and J. 2; the color fields were much contracted; the field for white was moderately reduced on the nasal side, and greatly contracted on the temporal side. No definite scotoma could be located. The optic disk showed possibly a slight pallor. Vision of the left eye was reduced to fingers at 1 foot, except in the upper temporal quadrant, where fingers could be counted at 12 feet. The disk on this side was distinctly pink—a capillary congestion. Neither at this time nor later was there increased tension of either eye, or changes in the media or fundi beyond the disks. The vessels remained of normal caliber, with no swelling nor cupping of the nerve heads. The pupils were equal, and noticeably large, the dilatation being marked in reduced light; reaction to accommodation and light was equally sluggish. Twelve days later the vision of the right eye had fallen to 20/70, at which point it remained for about a fortnight, and then sank with the left, so that by September 15 the bare detection of finger movements was the best that either eye could do. Both optic disks in the meantime had become very white.

The family history was negative. The father and mother and nine brothers and sisters were all living and in good health. There had been no visual trouble among the grandparents, as far as known. The personal history was clear up to April 1; no injury, and no illness other than the usual diseases of childhood. Syphilis was denied, and evidences of it were lacking. The patient's wife was well, in her first pregnancy, and since has been delivered at term of a healthy child. The Noguchi test was negative. There was no ataxia. The patellar and other reflexes were normal. There were no signs of tabes or paresis. The teeth, tonsils, nasal accessory sinuses, gastro-intestinal and renal functions and the pituitary and thyroid glands were all given consideration.

The man had worked as a railway warehouseman up to March 1, at which date he obtained employment in a shoe-shining and hat-cleaning shop connected with a cigar stand. Here he worked for two or three hours each day dyeing hats with a

commercial product called "Colorite"—a black liquid dye with a rather faint yet distinct odor of wood alcohol. The place was fairly well ventilated; there was also a door which was very frequently opened on the street. The temperature was about 70° F. His hands were spattered and stained black "about a quarter of the time." After five or six weeks of this he first began to note that objects looked smoky, while coincidentally he became easily tired, perspired freely, and suffered slightly from nausea and a somewhat vague "stomach trouble." There was slight headache and dizziness, which, however, eventually disappeared. These symptoms were more or less pronounced when he came under my observation after six weeks. When last seen he was once more in good health, but totally blind. This picture is, I believe, fairly typical of wood alcohol poisoning of the slow type. To make it a more perfect case, the findings should have included a scotoma, and "contracted retinal vessels," perhaps.

An original bottle of "Colorite," of which the man had used a dozen or more, was sent to the Bureau of Labor Statistics, United States Department of Labor. An analysis made at the Hygienic Laboratory disclosed 4 per cent of wood alcohol, the coloring matter being reported as one of the indulin group, negrosin. Though anilin black, as well as other of the anilin dyes, may sometimes be classed as poisons, and have been known to exert deleterious action on the cornea and conjunctiva,¹ no instance of nerve atrophy has been reported as following the use of any of the indulins. The man polished few shoes; nitrobenzene seemed not to be a possibility. The wife and fellow workers stated that he was an abstainer from alcoholic drinks.

DANGERS OF WOOD ALCOHOL.

In reporting one of the formidable series of imbibition cases from Russia subsequent to the abolition of vodka, Yakovleva² calls attention to the cumulative action of the poison. Tyson and Schoenberg³ refer to over a hundred cases of death and blindness, up to 1912, following the inhalation of wood alcohol. Buller and Wood,⁴ in their review of the subject, say, "It is also highly probable that in susceptible subjects repeated or even single methylated 'alcohol rubs' may produce poisonous symptoms, through absorption of the spirit by the skin." A few cases put on record since that report have corroborated this view. Campbell⁵ mentions a patient who had his chest bathed once daily for two weeks with wood alcohol, resulting in light perception only in one eye, and vision 15/20 in the other, with contracted field. Woods⁶ reported sudden blindness coming on in a man who had rubbed his legs with wood spirit each day for a month. Ziegler⁷ mentions an instance in which a temporary amblyopia followed exposure to the fumes of wood alcohol for only one hour daily over a month's period. The findings of Loewy and von der Heide⁸ that as small an amount of methyl alcohol as 0.2 per cent in the inspired air may lead to absorption in the body in not inconsiderable quantities indicates the possible danger that exists in even a moderate exposure to the poison.

⁸ Loewy and von der Heide: *Biochemische Zeitschrift*, 1914, 65, 230.

In a report relative to the possibility of poisoning taking place when the proportion of methyl alcohol is as small as 4 per cent, Dr. Alice Hamilton¹ quotes von Jaksch² to the effect that workers with denatured alcohol have shown symptoms of wood alcohol poisoning; Kobert,³ who says that the disturbances of health complained of by these workmen are to be attributed in part to the piridin bases used in denaturing, and in part to the wood alcohol, and Goldsmith,⁴ who agrees with Kobert, and who states that there was so much ill health and discomfort complained of by the men working with denatured alcohol that the workers sent petitions to the Reichstag, in consequence of which an inquiry was ordered.

Lewy⁵ reports that for the time during which, in Austria, denaturing was done by means of a 2 per cent admixture of wood alcohol and 0.5 per cent piridin bases (the present U. S. Internal Revenue Formula 2), there were so many reports of sickness caused by the use of alcohol so denatured that the ministry undertook an investigation in Bohemia, where many of the Austrian industries are located. The report emphasized the fact that wood alcohol was being used as the denaturant in place of pure methyl alcohol, and that wood spirit contains large quantities of acetone, aldehyde, allyl alcohol, methyl acetate, and other volatile compounds, all of which are toxic in a higher or lesser degree; but the report admitted that the effect of methyl alcohol was undoubtedly the principal one. There were at that time a number of cases of amblyopia among the Bohemian workmen who had been using denatured alcohol.⁶

The United States Internal Revenue regulations prescribe two general formulas for denaturing: The one, as mentioned above, a trifle less than 2 per cent wood alcohol, while formula 1 provides for 10 parts of this spirit and 1 part of benzine to 100 parts of ethyl alcohol, each by volume, a mixture which, though suggested by no less authority than Dr. Wood,⁷ would seem from the Austrian account to be fairly dangerous. It has also been set forth as an argument in favor of the use of wood alcohol as a denaturant that a 10 per cent "methylated spirit" has for a long time been used in Great Britain and that no case of amaurosis has been reported from its industrial use. I spent part of my apprenticeship in the English clinics, and again more recently was relief house surgeon at Moorefields. The vast majority of British workmen who live in or near the large centers go to the hospital clinics for their eye treatments; the clinics are usually crowded; the time for investigation is limited, nor is it common practice to follow the dubious case back to the home or workshop. It was found in reviewing the histories of 300 optic atrophy cases—an opportunity afforded through the courtesy of some of the Moorefield staff—that even when the aids of Wassermann, Roentgen, and Onodi had been taken advantage of, 15 per cent of the optic nerve degenerations remained unexplained.

In the same number of the Journal of the American Medical Association appears another article (p. 145) on "Wood alcohol poisoning," by A. O. Gettler, Ph. D., and A. V. St. George, M. D., pathologic chemist and pathologist, respectively, Bellevue and Allied Hospitals, New York, which discusses the dangers from the use of wood alcohol

in liquors and various preparations offered to the public. After citing a number of cases in which poisoning occurred from such use of wood alcohol, the authors reached the following conclusions:

It is important to note that the refined wood alcohol, in addition to being used as a diluent of whisky, is frequently used in the preparation of essence of peppermint, Jamaica ginger, lemon extract, punch, cologne, liniments, Florida water, bay rum, witch-hazel, and in the arts in lacquers, varnishes, etc.

Physicians and health officers should warn the public of the dangers existing in the preparations of the kind enumerated above when applied to or introduced directly or by inhalation into the body. European authorities have shown that the denatured ethyl alcohol serves every purpose in medicine and in the arts as well as wood alcohol or better. We suggest, therefore, that legislation be enacted bringing about the prohibition of the sale of wood alcohol for domestic purposes, similar to laws now obtaining in England and Germany.

DISEASES OF OCCUPATIONS IN GREAT BRITAIN DURING 1917.

A summary of the cases of diseases of occupations, and deaths resulting therefrom, in Great Britain during 1917, and also, for comparative purposes, during 1916, is presented in the January issue (p. 24) of the Labor Gazette, published by the Ministry of Labor. It shows that the total number of cases of poisoning and of anthrax reported to the Home Office under the Factory and Workshop Act during the year ending December 31, 1917, was 650, of which 82 (12.6 per cent) resulted fatally; in 1916, 13.8 per cent of the cases reported resulted fatally. In addition to these cases, 57 cases of lead poisoning (including 18 deaths) among house painters and plumbers came to the knowledge of the Home Office during 1917. The following table gives an analysis of all these cases and the fatalities resulting:

CASES OF DISEASES OF OCCUPATIONS, AND FATALITIES RESULTING THEREFROM, IN GREAT BRITAIN DURING 1916 AND 1917.

² Increase.

HOUSING AND WELFARE WORK.

ADMINISTRATION AND COSTS OF INDUSTRIAL BETTERMENT FOR EMPLOYEES.

BY ANICE L. WHITNEY.

In the numbers of the MONTHLY REVIEW covering the period from September, 1917, to the present issue, articles dealing with different aspects of the work for the improvement of working and social conditions for employees have been published. The present article treats of the methods of carrying on such work, the costs to the employer, and the effect of the work on the efficiency and stability of the force in the different establishments visited.

COST TO THE EMPLOYERS OF BETTERMENT ACTIVITIES.

It was found in this particular phase of the welfare study that it was difficult to get very exact information, both on the costs and on the comparison of the present conditions with those prevailing before service work for the employees began. It was rather surprising to find that few firms had definite knowledge of what the work was costing them. In the majority of cases, even with a fairly well organized department, no separate record of the expenditures was kept, and in those establishments which were able to give the amounts expended, there was so much diversity in the forms of welfare work for which the figures were given that it is difficult to make a comparison or arrive at very definite conclusions as to the outlay which might be considered to be a reasonable one. The costs, as given, vary from a fraction of 1 per cent to 5 per cent of the total annual pay roll. In those cases where the allowance is as high as 4 and 5 per cent, the costs of the pension or group insurance plans and the contribution to the benefit associations or the maintenance of an expensive clubhouse form a large part of the expense. It seemed, taking into consideration the scope of the work in relation to the costs, as reported by the different companies, that excluding unusual contributions to these features a fairly comprehensive program could be maintained for about 2 per cent of the annual pay roll. Another element to be taken into consideration in this matter of costs is the degree of participation of the employees. Those examples of welfare which cost the firms the most are not necessarily the most successful, since advantages are appreciated by most people in measure as they give

to them, both of money and effort. The company which, while encouraging and aiding such work, still leaves a share in both the management and the expense to the employee is probably nearer to harmonious plant relations than the employer who gives lavishly but administers the work in a more or less paternalistic spirit.

The following table shows, by industries, the number of establishments scheduled and their employees, the administration of the welfare work, and its effect in regard to the time lost and the stability of the labor force:

ADMINISTRATION OF WELFARE WORK AND ITS EFFECT UPON TIME LOST AND STABILITY OF THE FORCE, BY INDUSTRIES.

Industry.	Number of establishments.	Number of employees.	Welfare work administered by—		Establishments having—		Establishments reporting as to effect of welfare work upon—			
			Employer alone.	Employer and employees jointly.	Outside agencies co-operating.	Welfare secretary employed.	Time lost.		Stability of force.

³ Individual plants of 1 corporation have been counted as separate establishments.

⁴ Not including 5 establishments, not reported.

COMPARISON OF PRESENT CONDITIONS WITH THOSE PREVAILING BEFORE WELFARE WORK BEGAN.

The date of the beginning of welfare work, as reported by many of the firms, is somewhat misleading. Many firms had an employees' benefit association long before any other work of this character was even thought of, and to accept the dates given by these firms would give an entirely erroneous idea of the length of time over which the movement extends. It is safe to say, that with the exception of a comparatively few of these establishments, the major part of the progress along these lines would extend over only the last 10 or 12 years. The emergency hospital work, for example, has been introduced or extended in many of the hazardous industries since the passage of the various State workmen's compensation laws. The work along the lines of safety and sanitation also has been much influenced by these laws and has grown with amazing rapidity in the last few years. The increase in the number of firms providing a pension system for their employees has been very marked in the last seven years, and group insurance has developed entirely since 1911.

In spite of the fact that so much of this work is comparatively recent, it will readily be seen that, owing to the abnormal labor conditions of the past three years, it was very difficult to obtain from the companies a comparison of present conditions with those prevailing before welfare work was undertaken. The extent to which the output is affected by the welfare work is difficult to determine, both because of the present unusual labor conditions and the fact that few companies had made any study of this point. A few firms, however, gave it as their opinion that the output had been increased by it, although several of these stated that this improvement was only in part due to the welfare work. Quite a number stated that their increased output was due to a reduction in the working hours, a form of welfare which has not been given special consideration in this report.

The stability of the force also has been much affected in many plants by present labor conditions. One hundred and thirty-six of the establishments scheduled reported an improvement in this regard, due in whole or in part to the betterment activities. In many cases this was more than a mere expression of opinion, since many employers have, of late, been impressed with the fact that a large turnover is a very important item in the cost of production, and have been seeking to reduce this turnover by more scientific management of the employment departments and by the introduction of welfare features. One firm which had compiled statistics in regard to the reduction in the turnover had an increase of 13.4 per cent of employees of more than two years' service in 1916 over a similar group for 1914, due entirely, so the management stated, to their welfare work.

One hundred and sixty of the establishments reported an improvement in the time lost. There are probably two reasons for this: One is the work of the emergency hospitals, which care for the general health of the employees and do much preventive work, as well as sort out those most undesirable physically through their examinations on entrance; the other is the installation of safety devices and the education through safety lectures and literature, which has resulted in a large reduction in the time lost through industrial accidents.

Even though only a small proportion of the companies reported on this subject, still enough have done so to prove that welfare work does have an appreciable effect upon the work and health of the employees. It would be reasonable to suppose, even without the confirmation of such reports, that all service work which is carried on in such a spirit that it results in a more contented force, as well as a healthier one, must have the effect of making the employees more stable and more efficient. Another proof of this is found also in the attitude toward welfare work, even of those employers who are least in sympathy with it, for there is an apparent realization among them that much of this work is becoming necessary in order to get and retain a desirable class of employees.

ADMINISTRATION OF WELFARE WORK.

It will be found that the administration of this work is by employers alone in slightly more than half of the cases. This also probably gives a somewhat wrong impression, since there are necessarily many firms reported which do not do a great deal along these lines. The companies which do the least are those most likely to control entirely such features as they have, partly because the kinds of work first introduced are usually those which naturally remain under the immediate direction of the firm, and partly because it usually takes some experience in order to realize the desirability of giving the employees an active part in the conduct of the welfare activities.

It is natural that the employer should direct the work of the emergency hospital, although there are a number of cases where this has been given over to the benefit association; similarly several firms allow their employees to manage the lunch room, either on a cooperative basis or using the profits for either the benefit or the athletic associations. The employees quite frequently have a voice in the management of the club rooms or houses, in several instances being given entire control of the clubhouse. In the matter of athletics and recreation, more often the employer plays a passive part, assisting financially, and also providing rooms for meeting purposes, gymnasiums, and athletic fields. The work among families, except what is done in connection with the benefit association, is entirely under

the direction of the companies through the medium of the welfare secretary or visiting nurses. The administration of the benefit associations is in most cases either mutual or in the hands of the employees. Pension and group insurance funds, being in most cases provided by the firms, are therefore administered by them, as is much of the educational work, although frequently members of the force assist in teaching, especially in the classes in English for foreigners.

Mention must be made of one conspicuous and well-known example of cooperative management by the firm and its employees of both the business and the welfare organization. It has been the policy of this company in increasing degree through the past quarter of a century to give the employees a share in the management. An association of the employees is maintained, to which every employee belongs. The affairs of this organization are conducted by a group elected by the employees, and this executive body has the power to make, change, or amend any rule that affects the discipline or working conditions of the employees. This can be carried even over the veto of the management by a two-thirds vote of all the employees. This association is also represented by 4 members out of 11 on the board of directors of the corporation. All the parts of the welfare organization have been carefully built up and are controlled and managed by the council of the association through committees. The firm contributes club and business rooms, certain salaries, and any other assistance necessary. The fundamental principle followed by the club in the management, however, is that these activities shall be in the main self-supporting and that financial or other assistance rendered by the firm shall receive a direct return from the employees in increased efficiency. There is no doubt that in this particular instance the generous and broad-minded policy of the firm is reflected in the very unusual personal interest in the business which is evidenced by the employees as a whole.

COOPERATION WITH OUTSIDE AGENCIES.

Employers cooperate frequently for the betterment of their employees with certain established outside agencies, such as the local school boards, the Y. M. C. A., and the Y. W. C. A. In the North and West the continuation school work is often carried on beyond the requirements of the law, and several companies also cooperate with the public schools in their apprenticeship courses. In the South the public school terms are often extended many months each year through the contributions and assistance of the companies. The Y. M. C. A. and the Y. W. C. A. also serve as the medium through which the employers carry on the club work for employees, as in the case of most railroad companies which use the Y. M. C. A.,

since it is so well organized and seems particularly to fill their needs. In a few other instances firms have established their own branches of these organizations or pay membership fees for junior employees in the city branch. In many instances either one or both of these organizations, with the sanction of the company, conduct meetings for employees in the plant. In one western city an association of several of the nursing and charitable organizations does much welfare work for employees and their families in the different industries. This association is supported by voluntary contributions, and recently all the principal industries in the city except one agreed to pay 5 cents per month for each employee in return for which the association cares for any cases to which the employer calls its attention.

EMPLOYMENT OF WELFARE SECRETARY.

In 141 cases it was found that a welfare secretary was employed. Very often the secretary's sole duties are supervising the various welfare activities. In other cases the employment and welfare departments are merged into one, part of the time of the manager being given to each, and in still other instances the doctor or head nurse assumes these duties in addition to the hospital work. In quite a number of instances the welfare department employs a corps of trained workers. One large department store has, in addition to its medical department and welfare secretary, a number of college women engaged in educational work, physical culture, and dancing, as well as supervising the library and the girls' clubhouse. Another company which does much community work has, in addition to the head worker, seven others, teachers, librarian, and a visiting nurse who have kindergarten, manual training and other classes, many clubs among both young and old, and also have much general supervision of the townspeople, of whom many are foreigners.

The duties of a welfare secretary are many and varied. She frequently must oversee the work of the emergency hospital, see that the food served in the lunch room is kept up to the standard, and that the kitchens are kept in a sanitary condition, and look after many of the details of sanitation; she often has charge of the library unless it is sufficiently large to require one or more special attendants; her office is so placed that she has a view of the rest and recreation rooms, and in some plants, of the cloakrooms. Often, in cases of special need, she visits the homes, and a number of instances were found where the firm had placed a sum of money at her disposal, to be used at her discretion, in special cases of illness or distress among the employees or their families. In the larger cities there is a great deal of cooperation among those serving different firms in this capacity, in the way of exchange of ideas, and the visiting nurses'

association also is utilized often to help out in cases of illness in families. The State factory inspectors suggested to certain establishments, in one large city, which had not yet taken up any work of this sort, that they should allow an experienced woman to start the work for them. This woman, feeling that this particular city was well equipped to do the necessary educational and recreational work, did not include such work in her program, but confined herself to the installation of rest rooms, emergency rooms, and lunch rooms. Even when little space was available she utilized it until such time as the firm could provide more. Two or three months were spent in each plant getting the work under way, when it was turned over to a competent woman, and the same thing begun in another establishment. This particular welfare worker was able to interest the employers, since she believed that production is increased and labor turnover decreased by the introduction of this work.

CONCLUSION.

One might conclude that all welfare secretaries are women since they have been cited especially. In the majority of cases this is true, but in a number of instances this department, especially in those industries employing only men, is managed by a man. In either case the opportunity which is presented for a very broad and helpful service to the employees is very great. It is a difficult position to fill, since, if the policy pursued is not a liberal and broadminded one, the employees may feel that the position is being used to their disadvantage, but if, on the other hand, the one who holds it is gifted with sympathy and tact, the possibilities for help and encouragement of all kinds are almost unlimited.

LOW-COST HOUSING IN AMERICA.¹

How to meet at low cost the requirements of housing which shall be adequate in point of shelter, sanitation, provision for family life, and esthetic pleasure is the subject of a pamphlet recently issued from the Department of Social Ethics of Harvard University. It describes plans of one-family and semidetached houses actually constructed for approximately \$2,000 per dwelling. It is confined largely to examples of work done by employers, the data having been secured by correspondence with the companies.

The study emphasizes that the suggestions presented in regard to comparative costs of the houses of different types and materials are to be considered as "merely suggestive, and are not entitled to carry

¹ Low-cost cottage construction in America; a study based on the housing collection in the Harvard Social Museum, by Winthrop A. Hamlin. Cambridge, Mass., Harvard University, 1917. (Publications of the Department of Social Ethics, No. 7). 30 pp. 4 charts. Illus.

the weight of authority." Among the conclusions arrived at are: That shingled houses are more expensive than clapboards; brick about 7 per cent more expensive than frame (clapboarded), and stucco on metal lath about 3 per cent more expensive than frame. Data on concrete is too scant to make any estimate.

Frame construction seems likely to decrease because of the generally increasing cost of lumber as compared with that of clay and cement products, and because of the fire risk and high maintenance cost of frame houses. But in many localities wood still remains cheaper than other building materials. It will also tend to be used wherever social changes are occurring so rapidly that a more permanent type of dwelling would be an unprofitable investment. Brick is to be recommended wherever local conditions are such that it can be cheaply secured. Hollow tile is in somewhat the same class, though requiring further development before its possibilities can be fairly judged. Concrete, especially "poured" concrete, is of value chiefly in large-scale housing undertakings, though of course the steel forms once bought can be used to pour one house or a hundred. The progress of stucco depends especially on the certitude of good workmanship in its use.

The following paragraph suggests the author's ideas as respects the planning of low-cost cottages:

The plan of the cottage centers around the kitchen, and indeed the necessary size of the kitchen may be said to mark—inversely—the social progress of the worker's family. This evolution, however, takes different forms in various sections of the country, so that the following outline of it can claim to be only a general suggestion. When the family income averages about \$10 or less per week the wife usually has all her time consumed in cooking, washing, caring for the children, and doing outside washing or going out herself to work; in such homes the kitchen is perforce the family living room, and should be made proportionately ample. * * * Roughly speaking, when the weekly income approaches \$18, while the family may eat in the kitchen, they want a "best room" in which to receive callers, actual or hoped for. In families of a higher income class, the housewife is quite willing to carry food and dishes into the dining room in order to escape eating the food in the place where it was cooked; also a separate dining room is deemed more comfortable by the rest of the family. If there are only two rooms besides the bed rooms, families with low incomes are more likely to combine the dining room with the kitchen, leaving the other room for a parlor; as the income rises the living room assumes increased importance, absorbing the dining room when necessary. * * * Much might be written on the psychology of the parlor. Often, particularly in the country, the "best room" has become so lifeless as compared with the kitchen or with a separate living room that it is little more than a mausoleum of family culture. One may not enjoy being there, but the possession of such a room nevertheless tends to elevate the family life.

HOUSING CONDITIONS IN ST. PAUL, MINN.¹

A preliminary survey of housing conditions in a selected area is now recognized as a first step to the enactment of laws which shall correct evil conditions and establish a better standard of housing. A survey of housing conditions in St. Paul, Minn., has recently

¹ Housing conditions in the city of St. Paul. Report presented to the housing commission of the St. Paul Association by Carol Aronovici, Ph. D., director of Social Service, Amherst H. Wilder Charity. 120 pp.

appeared. Some of the more salient features of that report are here summarized.

Certain districts of the city where conditions were the worst were selected for investigation. The population of these districts numbered 18,425. If there is eliminated from that number 3,548 of mixed and unknown nationalities it appears that 36 per cent were either American or of other nationalities ordinarily considered as of desirable character, i. e., nationalities with high standards of living. Of the total number, 15 per cent were Jews. Considering a total of 3,626 dwellings, 69 per cent were rented by the occupants and 31 per cent owned. The largest percentage of ownership (58) was found among the Bohemians, and the lowest percentage among the English. The highest proportion of renters (87 per cent) was also among the English. In general, home ownership is more prevalent among the Jews, Italians, Germans, and Scandinavians than among the Americans.

Out of a total of 4,248 apartments studied, 44 per cent were one-family houses and 56 per cent multiple dwellings. No great congestion was found in the houses of either class, and while some instances of serious crowding were found they were limited mainly to abnormal dependent families with low standards of living.

Single dwellings were in poor repair in greater proportion than the multiple dwellings, due to the greater proportion of single dwellings of old construction. It is not the habits and standards of life of the people that are responsible for bad housing conditions in St. Paul, Minn., but rather structural defects of new buildings and the low standard of construction observed in the earlier days.

The investigation disclosed that there was no shortage of homes although there is a lack of better-class houses to meet the needs of wage-earning families.

Among the more serious evils may be mentioned the construction of toilets for use in common by from 2 to 10 families. The lodger evil is described as much less acute in St. Paul than in eastern cities.

There was found a considerable amount of bad lighting and ventilation and many dark rooms in the homes covered by the study, largely because of the poor arrangements of lots, the unscientific placement of buildings, the uncontrolled heights of buildings, and absence of regulation regarding distances between walls.

From the statistics collected it would seem that the two-family house represents a better investment than either the single dwelling or the tenement or multiple dwelling.

The report suggests the desirability of securing open spaces for parks and playground purposes within the area covered by its investigation. It points out in this connection that 16 per cent of the land area in the section studied is unoccupied.

The recommendations of the committee embrace suggestions for the drafting of a housing code; the establishment of a housing bureau devoted to the work of removing families to better houses and improved surroundings, keeping in touch with social agencies regarding sanitary conditions, and to act as a means of checking up the work of health inspectors, building and plumbing inspectors, and other officials; the socialization of rent collecting, i. e., the provision of cooperative rent collecting by real estate dealers and agents with a social service worker in charge of the collection of rents; and finally, the creation of a planning and zoning commission in order to provide the city with a careful plan for future growth.

The hotels and lodging houses are given special consideration and attention is called to the lax enforcement of existing laws which in themselves are sufficient if properly administered.

The preparation of this report was under the direction of Dr. Carol Aronovici, and was made possible by the Amherst H. Wilder Charity Foundation. The report is illustrated to show some of the more undesirable conditions found in back yards, toilets, and outhouses.

WAR HOUSING AND THE AMERICAN INSTITUTE OF ARCHITECTS.

The board of directors of the American Institute of Architects at its meeting in Washington, January 17, 1918, adopted the following resolutions:

WHEREAS, It is the belief of the board of directors of the American Institute of Architects that the question of providing within the shortest possible time a supply of workmen's houses such as will reduce the present waste in labor turnover, relieve the intolerable congestion, and provide good living conditions for workers, has for months been the gravest menace to the safety of the Nation and has now become vitally necessary to the victorious conclusion of the War, and

WHEREAS, The manner in which such relief is provided will not only determine the measure of our effort to increase the present volume of industrial production, but will profoundly affect the economic and social life of the Nation in the future; be it

Resolved, That the board of directors of the American Institute of Architects, at their meeting held in Washington on January 17, 1918, submit to the President of the United States, the Congress, the Labor Council, and the Shipping Board the following recommendations as expressing their belief in those essential features which should govern the whole program of industrial housing.

(a) The duly constituted authorities should have the right to take land for this purpose.

(b) Powers to survey needs for housing facilities and to determine, in cooperation with a central priority board, the relative importance of industrial operations.

(c) Powers to design and construct communities where the needs of such have been made evident by the survey.

(d) Powers to operate and manage these communities during the War and for a period of years thereafter.

(c) Powers to maintain a high standard of physical well-being in munition plants (adopting the standards set by our most progressive industrial corporations) and to organize community activities within the communities thus created; and be it further

Resolved, That as the ultimate disposition of these communities with the least loss and the greatest good to the Nation can not at this time be determined, there be created a commission to consider and report upon the following within a fixed period after the War:

(a) The basis upon which such communities could be transferred to municipalities or local limited dividend corporations.

(b) The organization of local limited dividend corporations to manage and develop the communities created during the War.

(c) The establishment of that part of the cost which should be written off as belonging to the cost of War.

(d) The methods of saving the appreciation of land values for the benefit of the community as a whole.

INDUSTRIAL CONDITIONS IN FOREIGN COUNTRIES.

INDUSTRIAL CONDITIONS IN JAPAN, 1915.¹

From 1907 to 1914, with the exception of 1909, the value of imports in Japan exceeded that of exports. But in 1915 and 1916 exports exceeded imports by 33 and 49 per cent, respectively. Exports in 1907 amounted to 432,412,873 yen (\$215,514,576), and in 1916 to 1,127,468,118 yen (\$561,930,110), an increase over 1907 of 160 per cent. Imports for these years amounted to 494,467,346 yen (\$224,014,525) and 756,427,910 yen (\$377,003,670), respectively, an increase of 68.3 per cent. In 1907 the value of exported silk, cotton, and other tissues, yarns, etc., clothing, and accessories was 229,100,134 yen (\$114,183,506) and in 1916 579,187,551 yen (\$288,667,075), an increase of 152.8 per cent.

Industry has developed in the last few years to a phenomenal degree. The economic conditions resulting from the war have produced a large demand for manufactures. Recent industrial activities have been adequate to the demand. Increased markets have been found, not only in Europe, but in the Far East, Australia, South Africa, and South America. The value of exports to the United States has increased from 125,964,408 yen (\$62,751,861) in 1906 to 340,244,817 yen (\$169,578,017) in 1916, an increase of 170.2 per cent.

The following table has been prepared to show the relative importance of the various groups of principal manufactures based upon number of employees and value or quantity of products, 1906, 1910, 1915.

¹ The Seventeenth Financial and Economic Annual of Japan, 1917.

NUMBER OF PERSONS EMPLOYED AND VALUE OF PRODUCTION IN SELECTED BRANCHES OF INDUSTRY, 1906, 1910, AND 1915.

Industry.	Number of employees.			Volume or value of products.		
	1906	1910	1915	1906	1910	1915

¹ Tons.² Number of families.³ Not reported.⁴ Not including value of hemp braid.⁵ Including value of hemp braid.

In the preceding table the value of production can hardly be considered as a basis for estimating industrial activities, since values have been largely influenced by the increased prices of manufactured products during 1914 and 1915. Data relative to quantity of articles produced are lacking in many cases, and the only available basis upon which increased activities can be estimated with any degree of correctness is the volume of employment. The quantities of a few articles of manufacture are reported, however, and show in a general way the extent of increased production. The quantity of cotton yarn manufactured increased from 46,188,000 kwan (190,918 tons) in 1906 to 85,288,000 kwan (352,538 tons) in 1915. While the quantity of Japanese paper manufactured in 1915 is slightly below that reported for any year since 1908, the quantity of European paper increased from 107,216 tons in 1906 to 249,254 tons in 1915.

The number of stock and partnership companies engaged in industrial undertakings increased from 2,546, with a paid-up capital of 267,118,424 yen (\$133,131,823) and a reserve amounting to 64,521,819 yen (\$32,157,675), in 1906, to 5,489 companies, with a paid-up capital of 879,540,314 yen (\$438,363,892) and a reserve of 113,383,586 yen (\$56,510,379), in 1915.

Wages for the years 1905, 1909, and 1914 are shown in the November issue of the MONTHLY REVIEW, page 149. They have varied but little in 1913, 1914, and 1915, but there has been a gradual increase year by year during the last 10 years.

The following table gives the actual average daily wages of working people and relative wages for 1915, those paid in 1900 being used as a base for computing relative wages.

AVERAGE AND RELATIVE DAILY WAGES OF EMPLOYEES IN SPECIFIED OCCUPATIONS, 1915.

¹ Monthly wages.

In 1915 the wages of farm laborers employed under yearly contract differed but little from those paid in 1914. Male farm laborers were paid in these years, on an average, yearly wages of 53.89 yen (\$26.84) and 53.70 yen (\$26.74) in the respective years, and female farm laborers, on an average, yearly wages of 32.18 yen (\$16.03) and 32.53 yen (\$16.20) in the respective years. In 1915 the relative figures, taking 1900 as a base, were 167.2 for male, and 190.7 for female laborers.

There were 161,425 operatives and apprentices, and 32,571 laborers employed in Government arsenals, machine shops, steel works, sail lofts, shipyards, etc. The average daily wages of male operatives and apprentices over 14 years of age, in 1915, varied from 56 sen (28 cents) in the printing bureau and forestry office to 81 sen (40 cents) in the military department. Daily wages of female laborers of the same age group, during the same year, varied from 27 sen (13 cents) in the monopoly bureau to 41 sen (20 cents) in the military department.

During the year ending December 31, 1916, the number of cooperative societies increased 244, the increase being confined almost exclusively to credit societies, or societies in which the function of

credit was an important feature. Societies for sale and those in which selling was one of the functions of operations decreased during the year. The different classes of cooperative societies, classified by kind of business for which organized, were shown in the REVIEW for November, 1917, page 150. The number in operation on December 31, 1915, was 11,509, and on December 31, 1916, 11,753.

Accident insurance is reported for 1912-13 to 1915-16. One company with a paid-up capital of 250,000 yen (\$124,500) issues this class of insurance only, and two other companies having a combined paid-up capital of 2,500,000 yen (\$1,246,000) issue accident insurance in connection with other lines of insurance. The number of contracts in force in 1912-13 was 6,079 and the amount of risk carried amounted to 9,226,040 yen (\$4,598,568). In 1915-16 there were 12,602 contracts in force, with risks amounting to 14,847,508 yen (\$7,399,998). Receipts have increased from 57,108 yen (\$28,463) in 1912-13 for the one company then in operation to 106,029 yen (\$52,845) in the year 1915-16, for the 2 companies, and during that period expenses increased from 52,624 yen (\$26,228) in the first-named year to 141,531 yen (\$70,539) for 1915-16.

The transactions of the post office savings bank show an increase from 5,848,498 deposits, amounting to 54,248,775 yen (\$27,015,890), on March 31, 1906,¹ to 12,700,105 deposits, amounting to 226,989,937 yen (\$113,131,785), on March 31, 1916. Of the total number of deposits reported in 1916, 4,334,623, amounting to 64,847,974 yen (\$32,320,230), were credited to agriculturists, and 933,607 deposits, amounting to 15,801,901 yen (\$7,875,667), were credited to operatives. The rate of interest on deposits was increased from 4.2 per cent to 4.8 per cent in April, 1915.

With the exception of 1914, there has been an increase each year in the amount of deposits, and with the exception of 1915 an increase in the number of deposits. During the period covered by the report the amount of deposits credited to operatives has increased nearly 400 per cent, an increase considerably greater than shown by any other class of depositors.

¹ The Sixteenth Financial and Economic Annual of Japan, 1916.

The following table is presented as showing the trend of prices of certain articles of food, etc., for specified years up to 1915:

AVERAGE AND RELATIVE PRICES OF 20 COMMODITIES IN JAPAN, 1906, AND 1912 TO 1915.

Recent strikes are reported to have occurred in Japan, due to the demand of working people for increase in wages owing to the high cost of living.¹ Authentic index numbers show that the cost of living has increased materially since July, 1914. The prices of food and other commodities have advanced 66 per cent over those of that date, and 41 per cent over those of July, 1916. The strikes so far as reported had been short in duration, in most cases settlement being reached by an increase of 15 or 20 per cent in wages. "In the last session of the Japanese Diet an appropriation of 430,000 yen (\$214,312) was passed for increasing the wages of postmen, and since then the Government has decided to grant 2,700,000 yen (\$1,345,680) for increasing the wages of some 80,000 post-office officials, including postmen."

¹ See Labour Gazette (London), November, 1917, p. 402.

ARBITRATION AND CONCILIATION.

CONCILIATION WORK OF THE DEPARTMENT OF LABOR, JANUARY 16, 1918, TO FEBRUARY 15, 1918.

Under the organic act of the department, which gives the Secretary of Labor the authority to mediate in labor disputes through the appointment, in his discretion, of commissioners of conciliation, the Secretary exercised his good offices between January 15, 1918, and February 14, 1918, in 58 labor disputes. The companies involved, the number of employees affected, and the results secured, so far as information is available, were as follows:

STATEMENT SHOWING NUMBER OF LABOR DISPUTES HANDLED BY THE DE-
PARTMENT OF LABOR, THROUGH ITS COMMISSIONERS OF CONCILIATION
JAN. 15, 1918, TO FEB. 14, 1918.

Name.	Workmen affected.		Result.
	Directly.	Indirectly.	
Controversy, Miller Rubber Co. and machinists, Akron, Ohio.	25	2,000	Unable to adjust.
Strike, Washington Tin Plate Co., Washington, Pa.	180		Adjusted.
Controversy, plumbers and steam fitters, Camp Park, Ark.	70	1,800	Pending.
Controversy, Charles Kronauer & Co., Harness and Saddlery Works, Chicago, Ill.	80		Do.
Controversy, Durham Coal Co. and miners, Durham, Ga.	300		Adjusted before commissioners' arrival.
Strike, Bartle Tent Co., Troy, N. Y.	800		Commissioner learned plants closed permanently and contracts canceled.
Controversy, Kansas City Railways Co., Kansas City, Mo.	1,800		Adjusted.
Controversy, Schlueter Manufacturing Co. and sheet-metal workers, St. Louis, Mo.			Pending.
Threatened strike, boiler-makers and helpers, contract shops and shipyards, Cleveland, Ohio.	245	2,730	Adjusted.
Controversy, agricultural workers and employers, Porto Rico.			Pending.
Controversy, Pacific Construction & Engineering Co., Seattle, Wash.	69	175	Adjusted.
Threatened strike, packing-house employees, Carstens Packing Co., Armour & Co., and two smaller concerns, Spokane, Wash.	350	500	Pending.
Strike, Pensacola Shipbuilding Co., Bay Point, Pensacola, Fla.	100		Adjusted.
Controversy, Southern California Edison Co.			Pending.
Controversy, Wilkes-Barre Street Ry. Co., Wilkes-Barre, Pa.	130	210	Adjusted.
Strike, The Durant Pattern Co., Standard Pattern Works Co., Ideal Pattern Co., Great Lakes Pattern Co., Brost Pattern Co., Superior Pattern Works, General Model Pattern Works, Wellman Pattern Supply Co., and Whaling & Son Co., Edam Pattern Works, and J. Remesch Pattern Works, Cleveland Ohio.	125	25	Do.
Controversy, retail meat markets, Kansas City, Mo.			Do.
Strike, metal workers, 18 iron mills, New Orleans, La.	6,000	10,000	Do.
Controversy, Southern Railway Co. and clerks (entire system).			Pending.

STATEMENT SHOWING NUMBER OF LABOR DISPUTES HANDLED BY THE DEPARTMENT OF LABOR, THROUGH ITS COMMISSIONERS OF CONCILIATION, JAN. 15, 1918, TO FEB. 14, 1919—Concluded.

Name.	Workmen affected.		Result.
	Directly.	Indirectly.	
Controversy, Atlantic Works and Boston Engineering Co. and plumbers, East Boston, Mass.			Commissioner reports controversy is jurisdictional and one that rightfully belongs to their respective unions.
Controversy, Remington Arms Co. and metal polishers, Eddystone, Pa.			Pending.

Controversy, Textile workers, Fall River, Mass.	30,000		Do.
Controversy, Sturtevant Co. and metal polishers, Boston, Mass.			Pending.
Strike, electrical workers, Detroit, Mich.	400	1,100	Unable to adjust.
Controversy, Ames Iron Co., Oswego, N. Y.			Pending.
Controversy, American Locomotive Co. and machinists, sheet-metal workers, steam filters, etc., Schenectady, N. Y.	2,500	2,000	Adjusted.
Strike, machinists, Tennessee Coal, Iron & R. R. Co., Ensley, Ala.			Pending.
Controversy, stove manufacturers and metal polishers, Detroit, Mich.	100	200	Adjusted.
Controversy, laborers and helpers, Seaboard Air Line R. R. Co.			Pending.
Strike, Ohio Locomotive Crane Co. and Carroll Foundry & Machine Co., Bucyrus, Ohio.	100	300	Unable to adjust.
Controversy, machinists, Denver, Colo.			Pending.
Lockout, Penn Garment Co., Williamsport, Pa.	38		Adjusted.
Controversy, Chicago & Eastern Illinois R. R. Co. and maintenance of way employees.			Pending.
Strike, Canton Stamping & Enameling Co., Canton, Ohio.	460	40	Do.
Controversy, Jacksonville Terminal Co., Jacksonville, Fla.	70		Do.
Controversy, Woodward & Tiernan Printing Co. and bookbinders, St. Louis, Mo.			Do.
Controversy, street railway employees, St. Louis, Mo.			Adjusted.
Strike, electrical workers, Continental Can Co., Chicago, Ill.			Pending.
Controversy, Nickel Plate R. R. Co. and freight handlers and transfer men, Cleveland, Ohio.	110		Do.
Strike, molders, Nashua, N. H.			Do.
Controversy, meat packers and Master Butchers Association and Butchers' Union, Seattle, Wash.			Do.
Controversy, Bartlett & Haywood, Baltimore, Md.			Adjusted.
Threatened strike, Joplin & Pittsburg Ry. Co., Pittsburg, Kans.			Pending.
Strike, longshoremen, Southern Pacific R. R. Co. and steamship lines, New York.	1,100	2,500	Adjusted.
Controversy, pattern makers, Cincinnati, Ohio.			Pending.
Controversy, Savage Arms Co., Utica, N. Y.			Do.
Controversy, Atchison, Topeka & Santa Fe R. R. Co. and clerks, Chicago, Ill.			Do.
Controversy, Western Gas Co., Fort Wayne, Ind.			Do.
Controversy, Duluth shipyard, Superior, Wis.			Adjusted.
Controversy, Herf & Frerich Chemical Co., St. Louis, Mo.			Pending.
Controversy, Missouri, Kansas & Texas R. R. Co. and clerks, Fort Worth, Tex.			Do.
Controversy, Pennsylvania R. R. Co. and shop employees, St. Marys, Pa.			Do.
Controversy, butchers, Denver, Colo.			Do.
Strike, Grant Smith Shipyards, Portland, Oreg.			Do.
Threatened strike, asbestos workers in entire local asbestos working and insulating industries, Seattle, Wash.	25	50	Do.
Strike, Carstens Packing Plant, Tacoma, Wash.	150	300	Do.
Controversy, Empire Steel & Iron Co., Wharton, N. J.			Do.

The following cases noted in January 14 statement have been disposed of:

Strike, Connecticut Electric Steel Co., Hartford, Conn. Unable to adjust.
Strike, box makers and sawyers, Chicago, Ill. Adjusted.

Threatened strike, Wabash Railroad, railway clerks. Adjusted.

Strike, electrical workers, Casper, Wyo. It developed that power companies claimed they could not afford to pay increases demanded; discontinued wiring business and would not require services of men any longer.

Controversy, Chicago, Terre Haute & Southern Railroad Co., Terre Haute, Ind. Adjusted.

Controversy between Associated Weighmasters' & Scalesmen's Union and United Weighers Association. Adjusted.

Controversy, stationary firemen, Lowell, Mass. Adjusted.

Controversy, Fairbanks, Morse Co. and its pattern makers, Beloit, Wis. Adjusted.

Controversy, American Steel Foundry Co. and iron molders, Granite City, Ill. Adjusted.

Controversy, electrical workers, Pittsfield, Mass. Adjusted.

Controversy, Chicago, Peoria & St. Louis Railroad Co. and mechanical force, Springfield, Ill. Adjusted.

Controversy, Chicago, Burlington & Quincy Railroad Co. and car-service men, Beardstown, Ill. Adjusted.

Controversy, Scholl Manufacturing Co. and metal polishers, Chicago, Ill. Adjusted.

Controversy, Dayton Steel Foundry Co. and molders and car makers Dayton, Ohio. Unable to adjust.

Controversy, Toledo Shipbuilding Co., Toledo, Ohio. Adjusted.

Controversy, Allyne-Ryan Foundry Co. and pattern makers, Cleveland, Ohio. Adjusted.

Controversy, Delta Electric Co., Marion, Ind. Adjusted.

Controversy, Busch-Diesel-Sulzer Manufacturing Co. and pattern makers, St. Louis, Mo. Adjusted.

Controversy, Clark Bros. Co. and molders, Olean, N. Y. Commissioner reports no trouble prevalent at plant of Clark Bros.; company operating harmoniously; manager claims company has all help desired.

Controversy, Nash Motors Co. and pattern makers, Kenosha, Wis. Adjusted.

IMMIGRATION.

IMMIGRATION IN NOVEMBER, 1917.

The number of immigrant aliens admitted to the United States during the year 1916 was 355,767, as compared with 258,678 for the year 1915, an increase of 97,089, or 37.5 per cent. There was also an increase from month to month during 7 of the 12 months in 1916. During 1917 the figures for the first three months show a considerable decrease from month to month. The decrease from the preceding month for January, February, and March, 1917, is 19.9, 22.3, and 19.4 per cent, respectively. For April, however, the number of immigrant aliens admitted shows an increase of 32.3 per cent over the number admitted in March. As compared with April, the figures of May show a decrease of 48.9 per cent. The figures for June indicate an increase of 5.5 per cent over those for May. During July only 9,367 immigrant aliens were admitted. As compared with figures for July, those for August show an increase of 7.3 per cent. In September the number fell to 9,228, or 139 smaller than the number admitted in July. As compared with August the figures for September show a decrease of 8.2 per cent. In October there was an increase over the September arrivals of 57, or 0.6 per cent. The admissions in November numbered only 6,446, a decrease of 30.6 per cent from the number admitted in October. These facts are brought out in the following table:

IMMIGRANT ALIENS ADMITTED INTO THE UNITED STATES IN SPECIFIED MONTHS,
1913 TO 1917.

Month.	1913	1914	1915	1916	1917	
					Number.	Per cent increase over preceding month.
January.....	46,441	44,708	15,481	17,293	24,745	1 19.9
February.....	59,156	46,873	13,873	24,740	19,238	1 22.3
March.....	96,958	92,621	19,263	27,586	15,512	1 19.4
April.....	136,371	119,885	24,532	30,560	20,523	32.3
May.....	137,262	107,796	26,069	31,021	10,487	1 48.9
June.....	176,261	71,728	22,598	30,764	11,095	5.5

PUBLICATIONS RELATING TO LABOR.

OFFICIAL—UNITED STATES.

CALIFORNIA.—*Industrial Accident Commission. Safety and Efficiency in Mines. Bulletin 2, May, 1916; Bulletin 3, October, 1916; Bulletin 4, February, 1917, each 15 pp.; Bulletin 5, Relating to safeguarding of a gold dredge, June, 1917, 23 pp.; Bulletin 6, Merit rating California mines for compensation insurance, June, 1917, 36 pp. Tentative safety rules for gold dredges, 1917, 29 pp. Sacramento.*

These bulletins are issued in cooperation with the United States Bureau of Mines. Each of the first three contains a discussion of the causes and prevention of accidents in connection with some particular phase of mining. Bulletin 5 is illustrated, showing methods of safeguarding certain kinds of machinery. There is an outline showing how to introduce a safety campaign through the organization of safety committees. Bulletin 6 aims to present a just and equitable schedule under which merit rating may be done. It is explained that recognition is given the safety work and safety conditions at any mine, and that these factors are rated so that the insurance rate to be paid will depend quite largely on conditions at the mines. Instead of demanding that all minor precautions must be observed, the schedule leaves to the judgment of the operator the decision as to whether certain precautions shall be regarded. If regarded, the rate is reduced; if disregarded, the rate is correspondingly increased.

ILLINOIS.—*Department of Mines and Minerals. Thirty-sixth annual coal report of Illinois. Springfield, 1917. 302 pp.*

According to this report the total tons (2,000 pounds) of coal produced by 810 mines employing 80,893 men and working an average of 179 days during the year ending June 30, 1917, was 78,983,527. This is an increase over 1916 of 6.6 per cent in the number of employees and of 24 per cent in the number of tons produced. Of the employees, 1,527 were boys. Tables of wages paid show that the average price paid per gross ton for hand mining at shipping mines was 70.5 cents as compared with 67 cents in 1916, and for machine mining 56.8 cents as compared with 52.4 cents in 1916. The corresponding rates of wages at local mines were 91.6 cents for hand mining as compared with 74.9 cents in 1916, and 65.5 cents for machine mining as compared with 55.7 cents in 1916. Accident statistics show that during the year 207 lives were lost, 183 being in the mines, 19 on the surface, and 5 in the shafts, and that the number of tons mined to every life lost was 381,563. The fatality rate was 2.56 per 1,000 employees; in 1916 it was 2.17. Injuries to the number of 1,634, each resulting in a loss of 30 or more days, are recorded. The total time lost was 78,947 days, or an average of 57.58 days for each man who returned to work; 263 did not return to work. The number of fatalities was 25.5 per cent greater and the number of injuries was 25.2 per cent greater than during 1916, while the number of men employed, as stated above, was only 6.6 per cent greater.

MARYLAND.—*Industrial Accident Commission. Third annual report for the year November 1, 1916, to October 31, 1917, inclusive. Baltimore [1918]. 51 pp.*

This report is noted on pages 182 to 184 of this issue of the MONTHLY REVIEW.

MASSACHUSETTS.—*Bureau of Statistics. Labor Bulletin 122. Labor legislation in Massachusetts, 1915, 1916, and 1917, with index to bills affecting labor introduced during the session of 1917 and other matters bearing on the labor legislation of the year 1917. (Supplement to Labor Bulletin 104.) Boston, September 1, 1917. 162 pp.*

MINNESOTA.—*State Board of Control. Children's Bureau. Compilation of the laws of Minnesota relating to children, 1917. St. Paul, 1917. 185 pp.*

This compilation is simply a collection of Minnesota laws touching the lives and welfare of children from a social point of view rather than in purely legal and business ways.

NEW YORK (CITY).—*Tenement House Department. Eighth Report, for the years 1915 and 1916. 115 pp. Illustrated.*

Announces in the résumé of 1915-1916 that "the practical elimination of dark rooms in tenements made the year 1915 one of the important periods in the history of the tenement house department." When the problem was first attacked it was found that there were at least 300,000 dark and inadequately lighted rooms. "In 1901 when the department began its work the city death rate was 19.90 per 1,000—to-day it is 13.52." It appears that in 1916 there were 976,397 apartments in tenement houses, the number being increased by about 30,000 a year. During the year 216,429 orders were issued against 38,123 tenement houses found to be violating the law in some particular. In the first week of March, 1916, 5.6 per cent of the apartments were vacant.
